Receipts past week 749 tons as compared with 875 tons of the preceding week. There has been very little change in the San Francisco market this week, either in tons or selling prices. Receipts have continued rather light, but the demand has been slow and this, coupled with the expectation of new hay in a few weeks has prevented any advance in prices in our local market.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00
Same Oat Hay, fair to choice	17.00@19.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	17.00@20.00
Stock Hay	10.00@14.00
Straw	10.00@15.00
Barley, ground	30.00@34.00
Barley, rolled	26.00@29.00
Oats, Rolled Feed	33.00@35.00
Bran, Red	34.00@35.00
Bran, White	36.00@38.00
Millrun	35.00@40.00
Middlings	47.00@50.00
Linseed Meal	45.00@50.00
Cocoanut Meal	25.00@27.00
Alfalfa Meal	26.00@28.00
Cottonseed Meal	35.00@40.00
Sugar Beet Pulp	32.00

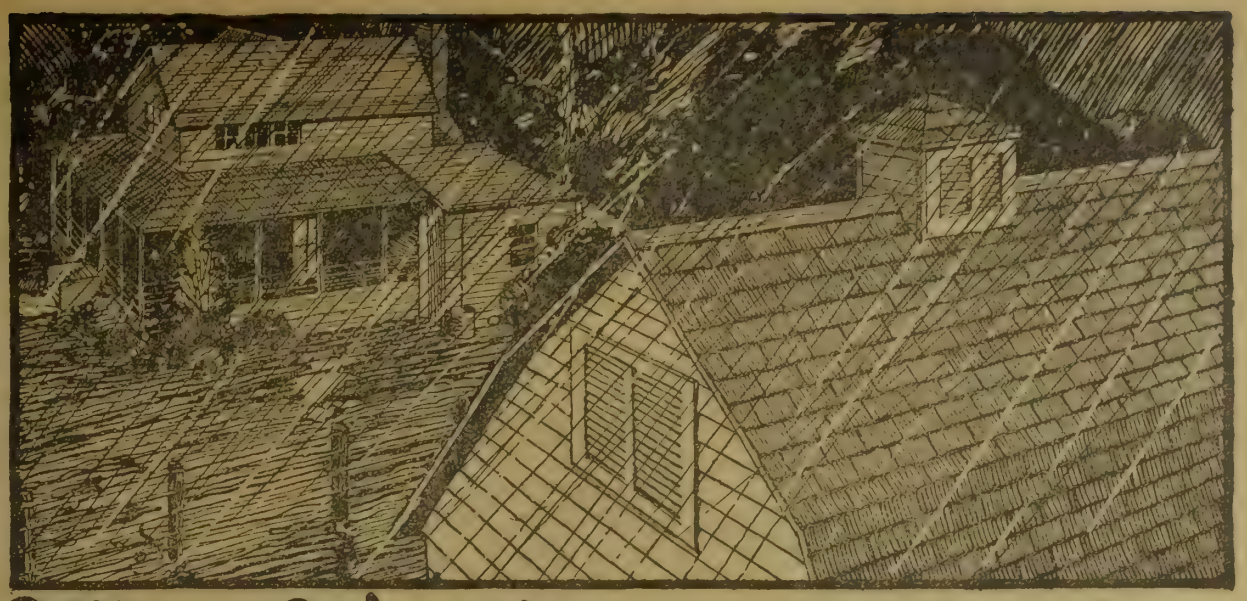
Citrus Markets

Los Angeles, May 4, 1921.

Finer quality of oranges never grew than this year's Navels. All other varieties are also of high quality, but run heavily to small offs. Valencias are now going from all the earlier Valencia districts.

Lemons featureless. All prices mean net loss to grower.

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 19,914 cars; lemons, 4,127; total, 24,041. To same date last season: Oranges, 15,980; lemons, 3,078; total, 19,058. From Central California to date, this season: Oranges, 4,948; lemons, 134; total, 5,082. To same date last season: Oranges, 4,570; lemons, 286; total, 4,856. From Northern California to date this season: Oranges 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.



Where Weather strikes hardest—
The Roof!

The roof takes the brunt of all weather—rain, wind and hot sun. Keep your shingle roof in good condition—a neglected roof means the cost of a new roof soon.

OTHER QUALITY PRODUCTS

especially prepared for use on the farm.

Oronite Roof Paint

A high-quality protective coating for prepared roofing and metal roofs.

Mica Axle Grease

Gives a durable, smooth lubricating film under every pulling condition. Keeps the axle cool; no hot-boxes, no gumming. The MICA makes it better.

Eureka Harness Oil

Preserves the original strength and life of leather and keeps it soft and pliable. Keeps harness "new looking."

Standard Hand Separator Oil

Correct Lubrication for your Hand Separator, under the conditions of high speed and close fitting parts.

ORONITE SHINGLE OIL
Preserves Shingles

Deterioration of shingles is caused by the penetration of moisture and air into the fibre of the shingles, hastening disintegration and decay. The natural oils in the wood evaporate and cracking and warping result. Your shingles need constant protection against the elements—rain, wind and sun.

Use Oronite Shingle Oil on all shingles either on roofs or on side walls. It is a high-quality preservative for shingles. It penetrates the shingle fibre and fills the pores with a moisture-resisting preservative. It retards evaporation of natural oils in the wood and counteracts the effect of age and exposure.

Oronite Shingle Oil is easy to use. It can be mixed with colors. Ask our nearest agent for formulas. Oronite Shingle Oil will make your shingle roof last longer and give better service to you.

One of the last great California Land Estates - Celebrated Ellwood Ranch

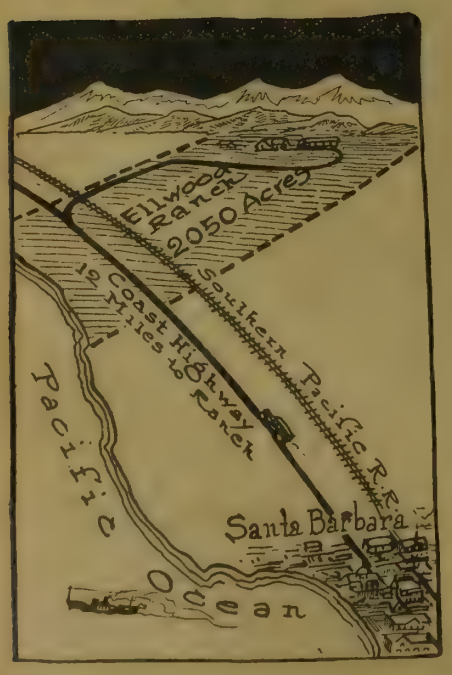
2050 Fertile Acres to be sold at AUCTION May 26th, 10 A.M.

Announcement Extraordinary!

TO CLOSE AN ESTATE We offer for Sale at Public Auction, One of the Finest, Largest and Most Fertile Ranches in California. Located 10½ Miles from Beautiful, Historic SANTA BARBARA.

The State Highway, paved and the Southern Pacific Ry. cross the Ranch — Ellwood Station is on the Ranch. One mile frontage on the Ocean with a beautiful crescent beach. The view is unsurpassed. The Ranch is highly cultivated, including— Producing groves of every description. There are extensive Lima bean and grain fields. A large tract being admirably adapted to hog raising.

The tall Eucalyptus, the Oaks and Sycamores beautify the ranch. The **buildings are numerous** and are exceptionally well constructed. The full blooded stock and splendid Equipment will also be sold — **The Stock** includes some 75 head of beef cattle, fine horses, registered hogs, sheep and poultry. The **Implements** include a Locomobile truck, auto with trailer, complete blacksmith shop, olive mill and dairy equipment. Everything necessary for the Ranch.



An Abundance of Water — Delightful Climate

What Better Place for a Country Estate?

The Rolling hills together with the broad expanse of fields offer unusual opportunities for GOLF COURSE or POLO FIELD.

Terms of Sale Will be Announced at time of sale by the Auctioneer.

Information Upon Request From Alfred Edwards, Commercial Trust & Savings Bank, Santa Barbara, or Fro

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The avocado seeks the foothills and there gives added beauty to the landscape and added wealth because of its productiveness. For more than a dozen years we have been hoping for much from our avocado plantings. These plantings have been increased every year and the time will soon come when it will be possible to send to the large eastern markets this fruit in carlots.

* * *

The development of the avocado as a commercial proposition has been somewhat slower than it would have been had varieties of known quality been developed earlier. There are perhaps a hundred varieties with, however, only five admitted to the preferred list of the association, and some growers hold strongly to the opinion that all of these may not keep their place under later revision. It is probable, however, that others may be added. Meantime individual growers are experimenting in growing and marketing these hundred or more varieties. There is no month in the year but avocado cocktail and all through the menu to avocado ice cream may be had from fresh fruits gathered from California trees.

The exhibit at Pasadena last week was certainly an eye-opener as to the magnitude of the industry and as to the vast number of desirable varieties now being experimented with. It was by far the largest exhibit ever made and brought strong conviction to avocado growers that the time would soon be here when the consumer must be informed of the wonderfully healthful qualities of this fruit little known at least outside the larger cities.

* * *

The federal farm loan board has succeeded in disposing of the $40,000,000 farm loan bonds and the work of advancing this money to the farmers is being expedited. As fast as the red tape can be cut the money will be placed in the farmers' hands. We believe the 11th district will get about $13,000,000 of this, and we believe applications are already on file for much of this money.

* * *

Dean Thomas Forsyth Hunt has tendered his resignation as delegate to the International Institute of Agriculture at Rome and has been succeeded by William H. Stevenson, vice-director of the experiment station of Iowa state agricultural college. We regret that Dr. Hunt has found it impossible to continue the work which he has carried on for several months. California has a feeling of ownership in this great institution because of its initiation by a Californian, David Lubin.

* * *

The British Medical Society reports that "Discussion on the position of vitamines in clinical medicine touched upon certan general considerations in regard to deficiency diseases and discussed briefly scurvy, beriberi, xerophthalmia and rickets. New evidence in regard to the stability of fat-soluble A was furnished in the report of experiments on rats showing that butter heated to 120 degrees Centigrade without aeration retained its growth promoting properties thus indicating that the vitamine, while having considerable heat stability, is easly oxidized. For satisfactory nutrition of animals the diet must have an adequate caloric value and must contain a sufficient amount of the following constituents: Mineral salts, carbohydrates, fats, proteins, adequate in amount and of suitable nature; water soluble or anti-neuritic (anti-beriberi) accessory factor, or vitamine; fat soluble accessory factor, anti-scorbutic accessory factor." Rather formidable but harmless, for we have been eating them all our lives.

* * *

Various portions of the state, especially under leadership of the daily press, are making much of slogans and catch phrases expressing the boost spirit. "Southern California Straight Ahead," "Northern California Straight Ahead," "Superior California," and other slogans have been adopted and are perhaps proving of value in engendering more of a community spirit. The Fresno Republican, however, takes the position that while loyalty to our own community is to be admired, our first loyalty is to our state, and why isn't "California" good enough for us all?

* * *

Camping parties are already arranging for the mountain trip. Members of these parties should consider the awful costs of carelessness with camp fires, with cigarette stubs, sometimes with gun wads. The immediate loss because of fuel or timber destroyed is only a small part of the great loss to California horticulture. The greatest loss is due to the denuding of the watersheds. This story is so old that it has become trite, and even perhaps to many of our careful campers offensive, but the fires continue year after year, so we must all continue to preach the gospel of greater care.

* * *

It may be in order in connection with the fire warning to remind our readers of the week established by the governor's proclamation which was given in full in last week's issue, "May 22 to 28, 1921, Forest Protection and Fire Prevention Week."

* * *

An Eastern farm paper suggests to its subscribers: "You have got to give full fair value or you won't last." That is about what California lemon growers are suggesting to the consumer, excepting that it is changed somewhat and ends like this, "we won't last." If the country wishes to be supplied in the future with California lemons it will have to take some means of getting to the lemon grower the cost of production.

* * *

NEW TRICKS

Prof. Gilbert Bailey remarked to us the other day that the time had come when we California producers must devote more energy to teaching new dogs old tricks. He said the old idea that you cannot teach the old dogs new tricks is proving so thoroughly dependable that we must turn our attention to the education of the youngsters, especially in the matter of putting our soils into a state of higher productivity.

In the first place there are some fundamentals as old as the hills in which the youngsters must be grounded in order to have a foundation for the information of a newer day. We were standing in the quarries where shells and decayed bones of animals which were living possibly a million years ago are being removed to add to the fertility of soils to grow fruits for 20th century people.

Years ago Dr. Hilgard remarked that the presence of lime exerts a dominant and beneficial influence on the productivity of all soils. "In general we find that lower percentages of potash, phosphoric acid and nitrogen are adequate when a large proportion of lime carbonate is present." The richest agricultural lands of the world are those which nature has limed or else any deficiency has been supplied by calcium in some form. Dr. Hilgard maintained that most California soils were rich in lime as well as in potash.

Presumably Dr. Hilgard was right, but there are still hundreds of thousands of acres of this Pacific Coast which need a bit of lime, hence the interest in a great deposit left in Palos Verdes hills when those hills may have been a sink in the bottom of the sea. However, they must have been near to land for, mingled with the untold millions of tiny shells, there are bones of animals long since extinct. These deposits are being quarried, crushed, screened, and thousands of tons are being hauled to citrus orchards. Nor is the citrus the only crop benefited, for just the other day in a little backyard garden in the town of Anaheim in Orange County we saw where a liberal application from these natural lime deposits had given one of the most wonderful exhibitions of lush growth in lettuce, beets, onions and possibly a dozen other garden crops.

Unless one knows our soil conditions, and few of us do, the application of lime may prove of great benefit.

The story of one day's observations is too long to give in this space and next week we wish to quote liberally from Dr. Hilgard and also just a bit from the imagination of writers of the present day as to the history of this lime deposit.

A FLOOD OF OIL

The emergency tariff is not showing any excessive activity. In fact, as an emergency proposition it may be so deliberate that any immediate advantage which was promised at the beginning of the present movement will be lost. Secretary Hoey of the California Olive Association finds that there is a flood of foreign oil flowing into this country from the Mediterranean which is increasing every day in the effort to get all available supplies into America from Europe before the enactment of the tariff is possible. Mr. Hoey says:

"While the industry is based upon the canned ripe olive which is produced nowhere else in the world outside of California and Arizona, the fact that 50 per cent of the crop, not of sufficient size or quality for canning, must be sold as oil makes it necessary to the life of the industry that this domestic oil should not be sold at a loss."

And the olive is only one of the many California industries which are threatened with destruction unless congress wakes up and does something besides everlastingly talk.

CROP CONDITIONS

The reports which have been quoted from so freely during the past few weeks show serious losses to the growers in many sections, but we may remind our growers, although it is desperately poor comfort, that they are not alone in this situation for all the Middle West, in fact the entire country, has suffered severe losses from freak weather. For instance, from report of the department of agriculture just received: "Wet soil is delaying planting in central states and is retarding preparation of soil in northern states. Replanting necessary in many sections." The above as to corn. With wheat: "Conditions fair to good; growth checked somewhat by recent cold weather." "Taking on yellow tinge in Illinois, Ohio and Tennessee." "Green bugs in some counties of Oklahoma." Cotton: "Planting delayed by wet, cold weather; replanting necessary; cultivation and chopping backward." Irish potatoes: "Severe frost damage almost everywhere."

As to a general look at the fruit situation the department reports: "The territory in which fruit has been severely damaged by freezes has increased in size and now embraces portions of the central belt of the United States as far west as the Rocky Mountains. The severe frost of April 24 and 25 probably caused almost a complete failure of cherries, apricots and peaches in the southern counties of Idaho and damaged peaches considerably in Utah. Frequent rains have been unfavorable for the setting of fruit in Oregon. The berry crop throughout the country has apparently escaped serious injury. Cherries are being shipped from California."

Livestock situation reported fair though poor in New Mexico and Arizona. "Hog cholera appearing in all sections of Illinois and increasing. Blackleg reported in Nebraska."

California Cultivator

The Avocado Convention

By Ernest Braunton

THE sixth annual meeting of the California Avocado Association was held, May 6 and 7, at the Maryland Hotel, Pasadena. Though the weather was bad and the storm elements threatening, a large per cent of the membership was present and many visitors. Some years ago former president Shedden said: "The avocado is rich and nutty and so is the avocado fancier." But it has been abundantly proven that the average grower at present is neither, and at no previous meeting has so much material advance been made in the interests of the avocado orchardist.

Friday afternoon the convention opened with an "experience meeting," with President W. H. Sallmon in the chair. Nearly the whole time was spent in discussing irrigation, drainage and soil problems. It was clearly proven by examples cited that the avocado tree cannot be given too much water if drainage is good. Some have irrigated trees once a week and others have them in lawns subject to daily waterings. In all cases trees are vigorous and have borne well. In contradistinction to this treatment, Mr. Hertrich, of the H. E. Huntington estate, has irrigated some in heavy soil but once in 60 days and none are in better condition. Thorough cultivation is his substitute for water. It was agreed that a soil auger test is the only sensible way through which the orchardist may learn the need of soil moisture. For nursery trees very large balls are necessary to contain a desirable root system. L. B. Scott advocated selection of seedlings for budding, using only the best.

On the Half-shell

A distinctive feature of the dinner enjoyed at 6:30 p. m. was a fully ripe half-fruit beside each plate, on the original shell. Avocado cocktails, avocado salads and avocado ice cream were other delicious dishes. President W. H. Sallmon acted as toastmaster with that usual engaging "smile that won't wear off." His introductory remarks were indeed prophetic. After recounting the happy semi-annual dinners of the past and expressing the hope of their continuance, he said the avocado industry was now upon such a large and substantial basis that marketing problems would in the near future far overshadow all other considerations, but made a plea to keep in view and practice the social side which has proven so attractive to members and visitors alike and extended the knowledge and use of the avocado as nothing else could have done.

The Speakers

The after-dinner speakers all were editors of leading farm journals of the state. The first was N. L. Chapin, editor of the California Farmer, formerly the Rural World. Then followed E. A. Street, editor of the California Citrograph; J. C. Knollin, editor of Orchard and Farm; and C. B. Messenger, editor of the California Cultivator. President Sallmon expressed regret that the editors of Pacific Rural Press and Times Farm and Tractor could not be present. All responded to some subject connecting the farm journals with the avocado industry and all happily acquitted themselves for the applause given was very generous.

Public Program

Saturday at 9:30 a. m. came the formal program of scientific and practical papers on phases of the avocado industry, of which all or part of each will appear in the Cultivator. The list of subjects and authors follows: Further Experiments on Maturity Work on Avocados, E. M. Chace, U. S. department of agriculture, Los Angeles; Discussion of Analyses of Avocados from the Standpoint of Nutrition, Prof. M. E. Jaffa, University of California, Berkeley; Effect of Girdling Trees on the Fruiting of Avocados, Dr. J. Eliot Coit, Los Angeles; Proper Method of Marketing California Avocados, L. W. Albright, Los Angeles; an interesting letter on his work in Central America, from Wilson Popenoe, department of agriculture.

Saturday afternoon was held the business meeting of the association, the public being invited, but the members only occupying the central section for convenience in voting. President Sallmon read his annual address covering experiences and progress of the three years in which he had been retained in office. He announced his retirement from the directorate and therefore from the presidency, with hearty thanks to all for the splendid work done in building up the membership to three times the number listed when he was first elected to the chair. By a unanimous rising vote the gavel used during his three terms was presented to him and it was ordered mounted with a silver plate, suitably engraved and inscribed to commemorate his happy and successful three-term presidency. J. M. Elliott, who presented this gavel to the association, quietly drew forth another to take its place and modestly, without speech, handed it to President Sallmon.

Varieties of Avocados

The report of the committee on varieties made no extension of the official preferred list of last year, which included: Fuerte, Spinks, Sharpless, Dickinson and Puebla, and no mention was made of the three varieties dropped from the original list. The report stated many inquiries were received asking for the name of a hardy variety for home use in the range of citrus districts in general throughout the state. For this purpose the Ganter, weighing about a half-pound, is recommended. Of new varieties two raised by W. A. Spinks are very promising, a large green named Alexandria and a thin-skinned violet-black named by the committee "Mission" (the name suggested by the Cultivator representative). Three winter varieties are growing in official favor, Dutton, Tiger and Dorothea. The Tiger is alone recommended for far interior districts, Redlands for example, as an excellent sort for family use.

In the secretary's report it was shown that there are 403 paid up members and 37 unpaid (25 in other states and 15 outside the United States); and the treasurer reported $2,013 in the treasury. F. O. Popenoe of the avocado correspondence course committee announced that a revision and extension of its course would soon be published and distributed by the state university. E. G. Hart introduced an amendment to the by-laws leaving the members in their original standing at $5 per year, except they shall not hold office or have their crops handled by a marketing department to be formed. This latter will be handled from a membership which calls for an annual fee of $16 a year. It passed with little opposition as the growers are evidently anxious to see the industry placed upon a firm cooperative basis such as has brought such grand results to the citrus industry. A resolution looking to legal standardization of the marketing of the fruit failed of adoption because of its drastic provisions and the fact that the marketing department will rule on such matters. The election of three directors to hold office for three years each resulted in the highest number of ballots, in a list of six, being cast for A. E. Barron, San Diego, William Hertrich, San Marino, and Dr. W. R. Manning of Fillmore. Mr. Barron is new blood to the list of active workers, and his election is due to the popularity of the retiring president. Mr. Sallmon explained the differing conditions in San Diego County, especially the earlier ripening season of the fruit over that of Los Angeles and vicinity and asked for the election of a director from the southern county. The result was an almost unanimous ballot for the candidate from the city of "bay 'n climate." The meeting then dissolved with everybody evidently in a happy frame of mind, for great things were accomplished for the avocado industry and the future has a bright, even a brilliant outlook. Not all avocado growers are "rich" or "nutty."

The exhibit of fruits was the largest and most varied of any yet held, consisting of 67 named varieties and two score or so of numbered seedlings of fine appearance. W. A. Spinks, Duarte, had 20 named varieties, 14 of the 24 Wilson Popenoe introductions, four Knight introductions, the Spinks and Colorado. W. P. Sherlock had a good lot of named varieties and 14 unnamed but numbered. A. R. Rideout of Whittier was there with a large number of Lyon and Dickey A., and an extensive collection of colored photographs of trees and fruits. The Mather Nurseries of Altadena had a fine tree exhibit. The number of fruits displayed ran into four figures and so did the number of visitors. All the exhibits, except the fruits given away, were sold Saturday afternoon, to all who applied, and a complete "clean-up" resulted.

The Effect of Girdling the Avocado

By J. Eliot Coit Before California Avocado Growers

CERTAIN varieties of otherwise excellent avocados are losing popularity on account of not coming into bearing as early and as promptly as is desirable for a commercial fruit. Various growers have attempted to overcome this difficulty by ringing or girdling. I have been asked to collect, digest and present the results so far secured.

Scientific Consideration

In the first place, it is well for us to consider the girdled branch from the standpoint of plant physiology.

Dr. Jacques Loeb of the Rockefeller Institute for Medical Research in New York City, working on the general problem of regeneration of tissues in animals and plants, has brought to light new facts in regard to plant growth which have a wide practical application to the propagation, pruning and girdling of trees. To state the matter in a few words, Dr. Loeb has found out that every growing tip of twig or shoot is continually giving off a certain substance which, for lack of a better name, he calls an "inhibitor," which flows downward toward the root. This substance represses, slows up, or prevents the growth of buds on the main stem by which it passes. The path followed by this substance is the bark just outside of the cambium.

The dormant buds at the leaf bases situated some distance down the stem are prevented from all growing out as soon as they are formed by being continually repressed by this downward stream of inhibitors from the growing tips. If it were not for this, all the buds on a branch would immediately grow out, taking all the sap as it passed by them; there would be nothing left for the tips, and growth in height could not occur. This discovery explains why tip buds which are farthest from the root grow the fastest. They are able to grow because they are at the apex, and there is nothing beyond them sending down an inhibiting substance.

As soon as we accustom ourselves to this new idea of a downward stream of growth inhibitors, we are in a position to undersand why, when we girdle an avocado limb, the region immediately back of the girdle gives rise to several vigorous suckers. It is because the dormant buds near the cut are freed from the repressing effect of inhibitors, and inasmuch as the sap channels are large and abundant, the new shoots are extra vigorous. We can now better understand why, in top-budding avocado trees it is usually better to girdle the limbs above the buds than to cut them off entirely. The girdle relieves the bud from inhibitors and allows it to spring into normal growth; whereas if we cut the limb off entirely, the bud is sometimes drowned out by the excess of sap.

The effect of girdling a limb there-

(Continued on Page 642.)

Agricultural News Notes of the Pacific Coast

Northern California

Newcastle is shipping out strawberries and cherries.

Grain growers conference at university farm, Davis, May 17-19.

The first box of cherries from Newcastle sold in Chicago for $50.

Modoc, Lassen, Shasta and Inyo Conuties are planning big squirrel drives this month.

Sutter County held its annual farm bureau picnic May 7 in the Dow Grove above Sutter Buttes.

A shipment of dried fruits through the Panama Canal to New York came through in perfect condition.

It is proposed to organize a unit of the Grange Patrons of Husbandry at Point Arena, Mendocino County.

Yuba County will hold its agricultural fair August 29-31 at Browns Valley, ten miles east of Marysville.

The annual citriculture trip taken by students of the state university visited Sacramento County, May 10.

Horticultural Commissioner Sherrard of Tuolumne County says there are 713 acres planted to apples in that county.

Tehama County grain growers have settled on a wage cut of approximately 50 per cent from last year's schedule.

Superintendent of Rodent Control Jacobsen has been holding rodent control demonstrations throughout Glenn County.

The farm home department of the Alameda County farm bureau held a garment finishers demonstration at Hayward on May 4.

The California Prune and Apricot Growers Association has won out in its membership campaign, going well past the goal it had set.

Potatoes shipped from California to Oregon must be inspected and certified by the standardization service of the state department of agriculture.

Former Secretary Bigelow of the state marketing commission has been appointed general manager of the California Farm Bureau Exchange.

The Farm Bureau Elevator Corporation's terminal elevator on the Oakland Estuary is now ready to receive all kinds of grain for storage, cleaning and conditioning.

Water users and land owners of the Glenn-Colusa irrigation district are discussing necessity of measures to control seepage of rice water which damages nearby lands.

The Pacific Rice Growers Association has filed petition with the state railway commission asking that rice shippers be allowed the same milling in transit privileges granted to grain shippers.

Secretary Iversen of the Point Arena Cow Testing Association reports 761 cows tested during March. The highest testing cow gave 75.9 pounds fat. She is owned by James Biaggi and Son.

The Bernard bill increasing penalty for delinquent reclamation assessments to 20 per cent and providing for sale of delinquent property has been passed by the legislature. Colusa County farmers say they never heard of the bill and they are getting in vigorous protests before it goes to the governor for his signature.

Central California

It is rumored that the great Miller and Lux holdings are to be broken up and sold.

Fresno is planning to appoint a permanent organization to plan for future raisin festivals.

There is talk of establishment of a plant at Turlock to manufacture alcohol from watermelons.

Fresno reports expenses paid by every branch of the raisin celebration except the music festival.

Kern County farm bureau meetings at Mountain View, May 16; Pond, 18; Inyo-Kern, 19; Rosedale, 20.

The state land settlement board has recently added 240 acres to its holdings near Delhi, Merced County.

Farm home department meetings in Kern County: Weed Patch, May 17; Inyo-Kern, 19; Kern Delta, 24; Wasco, 26.

The farm bureau at Kerman, Fresno County, is planning a campaign to raise $1,500 to improve the community picnic grounds.

The most unfavorable April weather for ten years is reported by W. G. Bennett of the U. S. weather bureau service at Fresno.

Officials of the U. S. air service recently made a landing at Porterville to inspect the field with a view to establishing a base for the Sierra air patrol.

The Kern County cotton gin has closed down after handling 3,700 bales. The gin handled cotton from Kern, Tulare, Kings, Fresno, Madera and Merced Counties.

The state supreme court has ruled that the Kern County supervisors must permit Miller & Lux to form a reclamation district to irrigate 85,000 acres of Kern County land with water from the Kern River.

Members of the Milk Producers Association of Central California have passed a resolution urging Governor Stephens to veto Bill No. 98 regulating tuberculin test for dairy cows.

Prof. F. T. Bioletti of the University of California has been holding demonstrations of disbudding and tying young vines at the demonstration vineyards at Turlock, Stanislaus County.

Farmers of Livermore Valley, Alameda County, have set minimum prices for volunteer hay at $13, barley $15, wheat $18. These prices are for barley hay f. o. b. Livermore, choice grade.

The pea aphis is doing considerable damage in Stanislaus County fields. Growers have been trying to get hold of ladybirds but they will not be available for some time until the heavy snows have melted in the mountain canyons.

Members of the San Joaquin Valley "diplomatic mission," numbering about a dozen representatives of civic organizations, visited Los Angeles chamber of commerce to obtain support of that body of withdrawal of the power filings made by Los Angeles in the Sierras.

The Associated Dairymen of California has formed a cooperative marketing organization to sell its products direct to retailers. Distributing plants are to be located in San Francisco, Los Angeles, Modesto, Fresno, Sacramento and other large centers.

Southern California

California produced in 1920 140,000 bales of cotton.

Aphis is causing much loss in many of the citrus orchards.

The first crate of cantaloupes out of Imperial Valley was sent May 3.

Annual picnic of the Orange County farm bureau at the County Park today, May 14.

Yucaipa Valley apples are reported as free from any injury by the late spring frosts.

Alfalfa growers of Chino, San Bernardino County, have organized a marketing association.

Orange County cow testing association now has 628 cows, seven herds averaging above 40 pounds.

Imperial Valley cantaloupe crop will be the largest in its history. Total acreage is about 23,271.

Poultrymen of Orange County are contemplating organizing a cooperative egg marketing association.

Twelve carloads of lemons were sent from San Dimas last week on the steamship Steelworker, via Panama.

Palmdale in the Antelope Valley of Los Angeles County celebrated the recent opening of the Mint Canyon road.

Commissioner Waite of Imperial County has a large corps of inspectors ready for the cantaloupe shipping season.

Carload shipments of tomatoes are now being made from Imperial Valley. The planting totals about 1,600 acres.

A community picnic of all residents on the Irvine Ranch in Orange County will be held at Orange County Park, May 28.

Apple growers of Yucaipa Valley are getting ready for closer cooperation in the handling of the coming season's output.

Growers in many Johnson grass infested districts report the April frosts as having killed many of the plants back to the roots.

More pure bred Guernseys are being introduced into the Imperial Valley. Many dairymen who deserted dairying for cotton are now coming back.

Coachella Valley shipped its first car of onions at the end of April. If price and railway rates permit, the valley will probably ship a total of 700 cars.

Garden Grove, Orange County, gave unusually large attendance to demonstrations on canning and drying fruits conducted by Miss Clark of the university extension.

Cotton growers of the Palo Verde Valley of Riverside County have united and will make consignments of cotton to dispose of last season's crop, which is yet largely in the hands of producers.

Growers and shippers from the entire Southwest gathered in Los Angeles last week and presented claims for lower freight rate before a representative of the interstate commerce commission.

Covina, Los Angeles County, held a great May festival on April 30. Citrus and walnut associations of the valley entered floats in the parade and there was an old settlers' picnic at noon on the high school grounds.

The Coast and General

Considerable injury to peaches from freezing is reported in Smith County, Texas.

It is expected that the forest service will expend some $6,000 in the vicinity of Tucson.

A personal survey of the farm credit situation is being made by Mr. Harding of the federal reserve board.

The animal husbandry department of the University of Arizona reports that Arizona is the only state that has a surplus of cattle in the spring market.

The state of Washington has a new plant quarantine law vesting the power of establishing absolute quarantine in the state's agricultural commission.

More than $150,000 has been pledged by county farm bureaus over Illinois for establishment of the national headquarters in Chicago of the United States Grain Growers, Inc.

Upon advices from the California authorities, 275 cases of Manchurian walnut meats reshipped from California were seized at Seattle, condemned as inedible and later released and sold for hog feed.

Reports from ranch sections of Arizona are to the effect that water for stock is becoming low in many places. Stock losses continue in some parts of the state. Some cattle are being shipped out to the Northeast.

A. B. Ballantyne, formerly county agricultural agent of Graham County, Arizona, has been appointed assistant extension director of the University of Arizona and will give special attention to the boys and girls club work.

Chelan County, Washington, commissioners have passed a resolution consolidating the offices of the agricultural agent and the soils expert with that of the horticultural inspector, all of the work to be conducted under the direction of P. S. Darlington.

One-fourth of the alfalfa crop of Kansas will be lost as the result of the ravages of the pea aphis. The infestation has been more severe in the southeastern and south central sections but late reports state that it has spread to northeasern and north central Kansas.

A new rabbit poison is being tried out in the vicinity of Casa Grande, under direction of D. A. Gilchrist, rodent pest director for Arizona. It is said that the first day's work resulted in killing 47 cottontails, two jack rabbits and over 150 kangaroo rats, at a cost of only 30 cents for the poison.

Cattle ranges in the national forests are being appraised upon the quantity and quality of forage, amount, distribution and usability of water, slope, exposure and altitude of range, distance of range from shipping points and markets, distance and character of driveways affording access to the ranges.

Twelve southern states have united in a cooperative cotton marketing plan, following meeting at Memphis, Tennessee, called by the American Farm Bureau Federation. Aaron Sapiro of San Francisco explained to the cotton men the workings of cooperative marketing as it is succeeding in California. The plan is to pool cotton crop for seven years.

Farmers Club's Twenty-Fifth Birthday

AT ONE time there were 69 farmers' club in California —now there is one—and it's a real club, a live club. In other sections the farm bureau has replaced the club.

The one club yet in existence is the Claremont Pomological Club which has just celebrated its twenty-fifth birthday. The day was devoted to a review of its history and to a memorial service for Dr. A. J. Cook, its founder. The club has a history showing accomplishment of value to all of California. This accomplishment is largely in the state legislature.

While it is called the Claremont Pomological Club it has members from Claremont, La Verne, Pomona, Glendora, Walnut, Anaheim, Ontario, Upland, Pasadena and Los Angeles. Of course, most of these members formerly resided in Claremont. The meetings are held at the homes of members, the host family providing the entire entertainment, but as each family is called upon only once in five years it is not a burden. The host at the last meeting was J. B. Coulston of Pasadena at his ranch on the Foothill Boulevard between San Dimas and Glendora.

Many guests were invited to this meeting, all being present excepting Dr. H. J. Webber, former head of the citrus experiment station at Riverside, and State Director of Agriculture Hecke. Dr. Webber replied, reviewing much of the work performed by Dr. Cook, and regarding the activities of the club said:

"While the club exists primarily to foster a knowledge of improved methods of agriculture, this is but one of its real functions. It has now become a recognized part of the community. Age has given it place and dignity. It is a community institution and one of the community's most noteworthy features. The club cannot be allowed to go down as it would be a distinct loss not only to the members but to the community and to the state. I greatly doubt whether the members of the club fully appreciate all that this club does mean to their community. It is distinctly a community feature. There is no other like it in California."

Mr. Hecke expressed regrets at not beng able to be present at the meeting and added:

"The Claremont Pomological Club is a historical landmark in California horticultural development, and its standards and influence reach far beyond the community in which it was organized. I want you to feel that the department of agriculture is in sympathy with your work and ideals, and we need your interest and support in the service we endeavor to render. Through our cooperative agreements with the federal department of agriculture I believe that your state department is in a better position than ever before to prevent duplication and overlapping of service and thereby make all efforts count."

Reading the letters from these absentees was the opening feature of the meeting, after which V. V. Leroy, who has been secretary of the club nearly all of its 25 years of existence, and a most faithful worker, read a history of the club activities and paid tribute to Dr. Cook. In part he said:

"Dr. A. J. Cook, who spent his life helping others, was the founder of the Claremont Pomological Club which is celebrating today its twenty-fifth birthday. When he came to Pomona College from the Michigan Agricultural College early in the year 1896 he saw the need of more scientific knowledge for the citrus growers, who 25 years ago were building up a great industry through many trials and tribulations.

"The first meeting was held at the ranch home of Prof. C. B. Sumner, Twin Oaks, on the Foothill Boulevard west of Claremont. So far as is known the only charter members alive today are Prof. C. B. Sumner, Edwin Squire, Mrs. E. M. Pease, Frank L. Palmer, Mrs. C. C. Johnson, Mrs. J. R. Moles and Mrs. F. D. Joy.

"The writer came to Pomona in the fall of 1898 and was the greatest tenderfoot in the West. But he proceeded to buy an orange ranch before he was here a week and has never regretted it. Knowing that he knew nothing about ranches or farms of any kind, being an eastern business man, he at once joined the Claremont Club. The next spring, 1899, he was elected its secretary and has held that position up to date, except one year when he and Dr. Cook were abroad.

"On our return in 1906 it was decided to change from afternoon to all-day sessions, with a dinner at noon. The club bought its silver, dishes, lap boards, coffee boiler, folding chairs, etc., so that each member in turn could entertain the 60 to 100 present without hiring these necessary accessories.

"The club has always been active in every progressive movement for the benefit and uplift of the state and community. Eighteen years ago the writer was asked by Dr. Cook to make a circuit with him on his institute work and give addresses on good roads."

Mr. Leroy referred to the work of W. A. Johnstone, at that time in the state assembly. The initiative of the club resulted in Mr. Johnstone getting behind a good roads bill and securing its passage. Mr. Johnstone supplemented the secretary's report as to the good roads effort by a history of his work on roads, fertilizer and other bills, the start for which was made in this club.

Other good work taken up by the club and referred to by the secretary was the establishing of a telephone system and pest control of the neighborhood immediately surrounding Claremont. Regarding this fight on one of the pests Mr. Leroy said:

"The inspection was made with E. O. Essig, now probably the best authority on insect pests in the state, in charge of the inspectors, and Prof. Baker superintending the records and the secretary receiving the reports each evening. A warfare was started under the direction of the club in cooperation with the county commissioners and the Claremont Citrus Association. The result was a complete eradication of a pest which in Ventura County cost one rancher $10,000 on a 40 acre ranch one year in an effort to clean it up.

"In this inspection a new scale was found by Mr. Essig which was not considered bad and hence was not taken in hand so strenuously but which is now getting to be serious. At that time, 1909, it was thought to be the coccus longulus, which later was found to be an error. The authorities now call it the gray citrus scale or coccus citricola Campbell."

Mr. Essig supplemented Mr. Leroy's talk on the scale with some of the details of the fight and referred to the life of Dr. Cook especially wtih reference to his work as an educator.

Dr. C. P. Sumner, president of Pomona College at the time of Dr. Cook's coming from Michigan, said:

"Dr. Cook came to Pomona College with a reputation of which anyone might be envious. He was one of the foremost scholars of the age in scientific and practical farming. His scholarly instincts not having been satisfied with the course of the agricultural college, he had gone to Harvard where he might sit at the feet of Agassiz and drink in of his profound study and experience."

Ernest Braunton of the Cultivator staff said:

"My first meeting with Dr. Cook was at a farmers' institute at Covina. 20 years ago. He had written to Dr. L. H. Bailey, who was then preparing the first edition of his great Cyclopedia of Horticulture, to know if he had a collaborator in Southern California who could lecture on plants and their uses as ornamentals. It is an odd coincidence that the two first institutes I spoke before were the only two that Dr. Bailey addressed. Two months later I first spoke before the Claremont Horticultural Club.

"Dr. Cook afterward told me that he was particularly pleased to have me recommended by Dr. Bailey, for the latter was one of his pupils back in Michigan when he was teaching common school. He spoke of the intense love of the Bailey boy for all departments of nature and how he loved to lead him farther into such studies. After listening to Dr. Sumner and others who have eulogized Dr. Cook as a teacher who enthused all students in his classes, to an unusual degree, I am wondering if he was not at least partially instrumental in launching Dr. Bailey upon the career that has made him world famous as an horticultural authority. World wide fame was denied Dr. Cook because he so loved his fellow man that he concerned himself with the welfare of those immediately about him rather than applying all his time to his chosen science. He was quite the reverse of the 'cold blooded scientist.'"

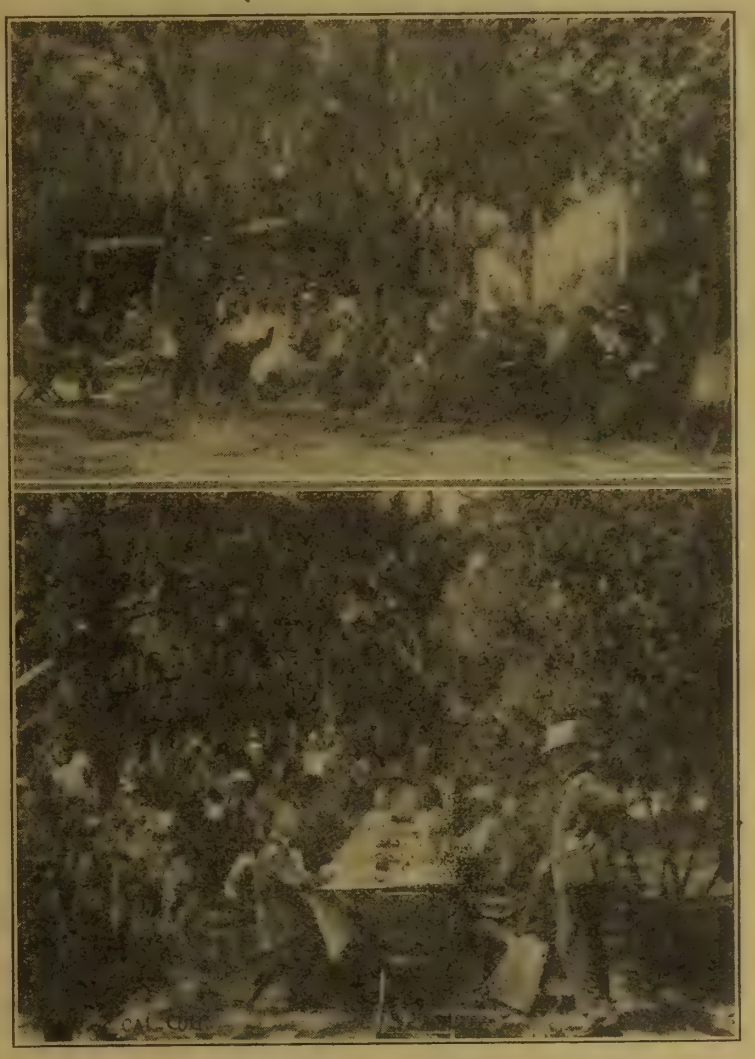
H. E. Strong of the state quarantine service; H. A. Ryan, horticultural commissioner of Los Angeles County; Dr. A. T. Barrett, head of the citrus experiment station; C. C. Teague of Santa Paula, and C. C. Chapman of Fullerton and others paid tribute to Dr. Cook's life.

Reminiscences regarding the installation of the telephone system and recounting of some of the difficulties which had to be overcome were given by C. B. Messenger of the California Cultivator. After reviewing some of the early history of the college and the club, he said in part:

"Later came Dr. A. J. Cook from Michigan, and with Cook came work and troubles and optimism and enthusiasm and accomplishment for many of us. Many of us were only slightly in touch with the college but he reached out and said, 'Come, men, let us get together.'

"We got together and amongst other cooperative movements he started was this Claremont Pomological Club. At one meeting at his home in the spring of 1902 Dr. Cook presented the matter

(Continued on Page 644.)



Feast of Reason and Other Good Things Under the Trees

Annual of the Claremont Pomological Club at the J. B. Coulston place. Upper photograph taken while club was being addressed by C. C. Teague. Back of the speaker, and sitting nearest margin of photo, President Needham. Lower picture taken at tables, J. B. Coulston standing.

THE EFFECT OF GIRDLING THE AVOCADO

(Continued from Page 639.)

fore is to permit the growth of suckers immediately behind the girdle, which appropriate a part of the raw sap, thus checking the vigor of growth beyond the girdle. At the same time, the elaborated sap coming from the leaves, which is transported through the bark is checked by the girdle and soon reaches a concentration which forces a rapid formation of blossoms and fruits.

Practical Results

Turning now from the field of plant physiology to actual results in the orchard, we find that girdling avocados does throw them into bearing. The testimony is unanimous on this point. I will have time to cite only a few of the large number of growers who have been good enough to answer my letters.

J. M. Elliot girdled a lot of Taft limbs in October. These limbs all bore from ten to 20 fruits each with nothing on the remainder of the tree. This year he has girdled a much larger number.

On October 24, 1918, Mr. Whedon girdled 65 Taft trees. The following summer he sold 234 fruits from the girdled trees, and none from those not girdled. It is interesting to note that even the next year the old girdles showed results, and in 1921 the Tafts bore 120 fruits while those not girdled are still bearing nothing.

Wm. Hertrich girdled 25 seedling trees with the results that 75 per cent of them blossomed and set fruit. At the ranch of Geo. D. Hoffman at El Miridor, Mr. Dolman has gotten good results from girdling and is continuing the work in an experimental way.

Dr. Keller girdled one branch of a three year old Linda with the result that the branch matured 38 fruits while only two were borne on the rest of the tree. Mr. Rideout and a number of others have had very similar results. Mr. Knight varies the process by using a binding wire instead of cutting out a girdle. His results show some variation, depending on the time the wire was left on. Mr. Spinks uses the girdle extensively in propagating and top-working trees, but not for fruit production.

While practically every one who has girdled in October has gotten fruit, a good many seem to think the procedure is dangerous on the ground that the limbs may be weakened and break at the scar. No one cites instances of actual loss by breakage, and I am inclined to the opinion that this fear is not justified. Where the cut extends just through the bark and is quickly healed over, the branch should not be weakened to any extent.

Conclusions

Girdling is inexpensive and brings big results. It has not yet been shown to be attended with serious damage to the trees. The best time is October. The best width of girdle varies with varieties from ⅛ to ¼ inch. Suckers arising behind the girdle should not be removed too soon.

By way of suggestion I would like to point out that more experiments should be made on root pruning. If a tree like the Taft persists in wasting its substance in riotous living and refuses to take life seriously, might not a vigorous root pruning furnish a sufficient check to vegetative growth to produce results without the scarring incident to girdling?

Willys LIGHT

JUNIOR

Only $295

Rock Bottom Prices are Here

EVERY home in North America can now afford electricity. The demand for lower prices has been met. Never before in the history of farm light and power have such values been offered. Think of it! A standardized electric light and power plant big enough for light and small power needs for only $295.

This price is only possible at this time because of intensive effort directed to engineering and production plus a determination on the part of Auto-Lite to meet the farmer more than fifty-fifty on price reduction NOW. Rock-bottom prices are here.

Willys Light Junior is a smaller plant. In every other respect it measures up to Willys Light in quality. It is air-cooled, has the wonderful Auto-Lite engine generator and standard voltage. Willys Light Junior puts electric light and power within the reach of every one.

600 Watts—32 Volts—80 A. H. Battery, $295; 160 A. H. Battery, $365; 240 A. H. Battery, $435. All prices F. O. B. factory.

Willys LIGHT

Power and Light with the Quiet Knight

Now $525

THIS extraordinary reduction in the price of Willys Light is but further proof of the Auto-Lite ability to produce quality products on a quantity basis.

This famous plant is equipped with the Willys-Knight sleeve-valve engine that improves with use, an exclusive superiority. In addition Willys Light has fifty distinct advantages.

Its wonderful record of success in making home life brighter and farm work lighter, together with its remarkable *new low price*, warrants you in buying now.

There is a dealer near you ready to serve you.

1,250 Watts—32 Volts—160 A. H. Battery, $525; 240 A. H. Battery, $595. All prices F. O. B. factories.

Wonderful Dealer Opportunities Available

WILLYS LIGHT DIVISION—ELECTRIC AUTO-LITE CORPORATION, TOLEDO, OHIO

OREGON GROWERS ARE COOPERATING

By C. E. Wilson

R. C. PAULUS, former sales manager of the Oregon Growers Cooperative Association, was elected general manager of the association and the Oregon Growers Packing Corporation at the annual meeting of directors held at Salem, Oregon, April 25. C. I. Lewis, former manager of the organization department, was made assistant general manager.

For 12 years Mr. Paulus has been active in fruit circles of the Northwest, holding many positions of trust, besides that of manager of the Salem Fruit Union. Mr. Lewis was for 14 years head of horticulture of the Oregon agricultural college at Corvallis, and is regarded as an authority on all matters horticultural in the Northwest.

The Oregon Growers Cooperative Association was organized August 1, 1919, with 137 members controlling 3,000 acres. The present membership is 1,648, with a control of 28,838 acres.

Loganberries handled by the association amounted to 1,072,956 pounds, averaging growers 12.7 cents a pound. Cherries averaged the same, 12.7 cents a pound, with sales of 1,014,955 pounds. The average of other berries a pound is as follows: Gooseberries, 7.9 cents; raspberries, 20 cents; strawberries, 16.9 cents; currants, 10 cents; evergreen blackberries, 7 cents; green prunes, 4.4 cents.

Of pears, the association sold 402 cars into 50 markets, believed to be the largest distribution ever given Oregon pears. New York City was the greatest market, taking 123 cars. Chicago bought 30 cars, San Jose 24 cars and San Francisco 18 cars. Forty cars were shipped to the southern markets with Baltimore in the lead, taking 15 cars.

England was a good buyer of Oregon apples. From the association London bought 86 cars and Liverpool four cars. Total shipments were 279 cars.

Pear shipments amounted to 402 cars. From the great pear district in southern Oregon in the Rogue River Valley the association shipped 5,555,953 pounds of pears. Of this, 3,955,870 pounds were Bartletts shipped from Medford and 618,225 pounds shipped from Grants Pass.

The association handled 27,514 crates of broccoli, selling 85 per cent of carlot shipments out of the state, developing 38 markets.

FRUIT GROWERS SUPPLY COMPANY HAS NEW LUMBER MILL

The California Fruit Growers Exchange announces the opening of its second lumber mill and box factory at Susanville, Lassen County. Coming at a time of readjustment and economic unrest, when prices of fruit as well as other food stuffs are low and the cost of production is high, this new undertaking is another progressive step in line with the policy of the California Fruit Growers Exchange in attempting to keep production costs at a minimum and also keep the price of citrus fruits within the reach of the consumer.

It was in October, 1907, that the Fruit Growers Supply Company was organized for the purpose of furnishing citrus growers with necessary orchard supplies at a minimum cost. Three years later, following the purchase of the Hilt properties, consisting of 25,000 acres of timber land, the company actually entered the field of shook manufacturing in order to supply a portion of the demands of the growers. In 1912 the mill at Hilt was rebuilt, making it a modern institution in every respect with a capacity of 50,000,000 feet per year as a maximum output. At that time this production was sufficient to supply half the box shook requirements of all the Exchange growers.

Answering Olive Oil Importers

By Frank Simonds

THE Olive Oil Importers Association has asked through the press a series of open questions which would tend to imply a case against the request for an adequate protective tariff that is being made by the American olive industry. It is with pleasure that we answer these questions.

They ask why in the years 1907 to 1912, when the Payne-Aldrich tariff of 40 and 50 cents a gallon was in effect, California produced only around 100,000 gallons, and that the highest production of the state, 200,260 gallons, was in 1916, which was a low tariff year.

Whatever the source of their figures, the honorable gentlemen seem to believe, or at least desire to make their readers believe, that olives are like summer squash and can be planted in the spring and harvested a few months later, and that therefore the growers of the state can adapt themselves promptly to market conditions.

It takes ten years to bring an olive tree into profitable bearing for oil production, and the olives planted for oil production as a result of the stimulus of the Payne-Aldrich bill were supplying their crop in the oil production of 1916.

Moreover, the Payne-Aldrich bill was never adequate to compensate the difference in cost abroad and in this country. The average of wages listed in the government's bulletin as being paid in various branches of olive oil production in Spain and Italy is 85 cents a day. The average of wages paid for the same service in California is $3.20 a day. The cost of producing a gallon of olive oil in California before the war was $1.63. The average cost at the factory of olive oil in Europe, during the same period, was 65 cents. A tariff of 40 cents would obviously not encourage extensive planting of olives for oil production in California, especially when there was no assurance that it would not be repealed, as it was a few years later.

The olive importers state that California and Arizona, where all American olives are raised, have not done very much but try to force high prices upon the American public. When the tariff on oil was reduced from 40 to 20 cents under the Underwood law, the consumer was not benefited in the slightest degree. The retail price was not reduced. The oil, as sold retail in small containers, is not priced at fractional figures giving the consumer benefit of lowered duty. The benefits were entirely absorbed by the importer. The California growers expect that oil will drop from its present figure even with the duty they ask, since producing costs are coming back to pre-war level. They only ask insurance against a drop that will destroy their industry and encourage the planting of a half million acres available for olive culture in California.

The olive importers quote the secretary of this association as stating that olive oil is only a by-product of the olive industry, but fail to catch the point that it is a necessary by-product. Nearly 50 per cent of the crop is not suitable for canning ripe and must therefore go into oil. Is it just that the American producers should lose money on half of their output or be forced to increase the price of ripe olives to make up their losses?

The olive importers stress the point that only two per cent of the olive oil consumption is produced in America. This is exactly the situation we desire to remedy. We have half a million acres on which to build a thriving American industry if protected from the product of European pauper labor. What are we to do with this land—let it grow up to cactus and sagebrush when it stands ready to supply this country with all of the olive oil it needs? It is neither reasonable nor American to do so.

Another bogie of theirs is that California olive oil is inferior to foreign imported oil. A California oil won the grand prize for quality at the Panama Pacific and St. Louis expositions in competition with oils from France, Italy and Spain.

They quote the fish canners of California as saying that it is too acid to be used for canning purposes. In answer to this Dr. Phelps of the bureau of chemistry says: "California olive oil is equal in quality and as good as the olive oil that is imported." When asked if it contained acid that gave an unpleasant flavor to canned fish, he said at the congressional committee hearing: "That is not true of good olive oil."

And at last the importers ask, "Is this a political or economic issue?" It is both. It is an American issue. A great American industry hangs in the balance and asks for a recognition that will enable it to supply the American market at fair American prices. It contemplates no increase in the price of olive oil, but would forestall the imposition of European pauper standards of living upon American life through the unloading of great quantities of European oil on our shores in an attempt to regain a lost balance of trade.

LABOR SCHEDULES

Farm organizations generally are agreeing on reduction of wage scales in grain fields and general farm work. Grain growers met recently at Red Bluff and agreed upon a wage cut of approximately 50 per cent from last year. The following schedule of wages was established for harvest hands during the coming season:

For general hay hands, $2 per day and board.

Irrigators, $2.50 per day and board for ten hour day, and 25 cents an hour for overtime. Employers are to furnish boots.

Tractor drivers, 50 cents an hour.

Separator tenders, $5 per day and board for 12 hours.

Sack sewers, $4 per day and board.

Header tenders, $3 per day and board.

Sack bucks, $3 per day and board.

The Salinas farm bureau center has adopted a wage schedule to be paid by farmers in employing different classes of labor.

General farm labor, $2 per day.

Horses, per span, $1 per day.

Teamsters (beet hauling and beet plowing), $3 per day.

Experienced tractor drivers, $4 per day.

Irrigators, 30 cents per hour.

Sack sewers, $3.50 per day.

Hauling sacks from field to pile, $3.50 per day.

Experienced separator tender, $6 per day.

Hired man, per month, $50 per month.

Header loaders, $3.50 per day.

Threshing hands, $3.50 per day.

It was agreed that this schedule of wages would be adhered to until such time as it would be necessary to draw up a new schedule.

GARDEN CRAFT

Some hints by F. L. Wright in The Flower Grower:

Nearly the whole of the shrubs should be deciduous, so that the winter sunshine and health giving breezes may reach the ground among them. Only here and there a clump of evergreens may be planted. They always prevent flowering plants from succeeding if planted amongst them.

Among the shrubs should be planted all of those beautiful things which nature grows in such situations—primroses by hundreds, pansies in spots where they will be shaded during the summer, anemones of many kinds, ferns, all hardy lilies.

The nature which has been so long banished from gardens is the allowing and encouraging of every plant grown to develop its true character and beauty instead of ignoring that beauty, by pinching, trimming and training the plants into unnatural shapes, as is usually done.

The art which should find a place in gardens is the arranging of plants after the manner of nature's best groups, so that the plants may enhance each other's beauty by contrast of form of leaf and flower and habit of growth. It is just because that art is neglected that beds of hardy plants often have a poor effect.

Gill

One-piece Piston Rings

reduce fuel consumption

because: they are *individually* cast from a special gray iron that retains its tension, elasticity, and vitality under all the intense heat and terrific stress and strain of piston ring service. Gill Piston Rings, under all conditions and for thousands of miles, exert an all-around, uniform, leakless contact with the cylinder walls. They hold *all* of the fuel in the combustion chamber where *all* of it can be compressed into power. Where there are Gill Rings there is no waste.

THE GILL MANUFACTURING COMPANY,
8300 South Chicago Avenue, Chicago, Illinois

PACIFIC COAST BRANCHES:
GILL PISTON RING CO.,
1522 S. Grand Ave., Los Angeles
GILL PISTON RING CO.,
803 Van Ness Ave., San Francisco
GILL PISTON RING CO.,
409 Burnside St. West, Portland
GILL PISTON RING CO.,
723 Pike St. East, Seattle

Identify the Gill One-piece Piston Ring by the joint, but do not measure its merit by the joint *alone.*

Gill Service is nation wide. There are more than 2,000 stocks of Gill Piston Rings in the country. Some one of these dealers is located near you to supply you with whatever size you may want and the number you want *when* you want them. If your garage or repairman or accessory dealer doesn't happen to carry Gill One-piece Piston Rings tell him to get them from his jobber or from the nearest of our 39 Branch Offices.

FARMERS CLUB'S TWENTY-FIFTH BIRTHDAY

(Continued from Page 641.)

of a farmers' telephone line. Pomona had a few phones in operation in nearly all business houses and some residences. The expense demands for farm extensions were prohibitive. The service of such phones as were installed was maddening.

"But how could we, the inexperienced farmers, and some of us who wished we were farmers, ever build, equip and operate a telephone system? It was a pipe dream without the pipe. 'If the powerful Sunset with millions behind it could give only such wretched service, what could one without capital or experience accomplish?' 'Nothing doing!' and similar remarks were not heard by Dr. Cook.

"My work was with the business men of Pomona. They wanted nothing of the new outfit. Why tempt fate? But the outside of town workers were getting the farmers into line. Our minimum was 150 subscribers. Our rate was to be—if possible—50 cents per month for homes with slight increase for business houses. The 150 subscribers have increased in less than a score of years to nearly 6,000.

"The franchise was sold July 3, 1902, to D. S. Parker for $85. It was a long time before the city council could get a quorum. Finally George Carter came in from the desert and he with Moses Petty and W. H. Poston voted the franchise.

"Financial saving with far greater efficiency to thousands is possible because of the success of this institution fathered and mothered by Prof. A. J. Cook and this Pomological Club.

"And in giving tribute let us not forget the faithfulness, dependableness and hard work of V. V. Leroy, a pioneer and a stayer.

"Another child of the Claremont Club is the Los Angeles Mutual Fire Insurance Company, organized because of the initiative of the club at a meeting in 1899. The growth of this concern has been continuous, and it is now carrying over $13,000,000 insurance at a cost to the farmers of about half that of old line insurance. A. T. Currier is president and George F. Cromer, secretary. That company has organized another mutual insurance company of which Fred C. Cromer is secretary. One year ago, May 1, 1920, Policy No. 1 in that new company was written. Today it is carrying three-fourths of a million in business."

Probably the greatest benefit from any one movement initiated by the club was secured from the passage of the fertilizer bill drawn and pushed by members of this club. Frank L. Palmer, who was chairman of the committee, reviewed some of the work of Dr. Cook and the club, and regarding the fertilizer bill said:

"At a farmers' club institute or convention held in Pomona in March of 1902 a resolution was passed emphasizing the necessity for a fertilizer law in this state, and a committee was appointed to draft the proposed enactment and to submit such draft for the approval of the next similar convention that should be held. That committee consisted of Rev. C. B. Sumner of Claremont, George F. Ferris of Claremont and myself. I naturally took a strong interest in the project myself because at that time I was buying fertilizers for 300 acres of orange groves under my charge and was fully alive to the importance of securing the proposed legislation. Our committee fully realized that in anything that might be proposed we must secure the endorsement and approval of the state agricultural experiment station, and I therefore opened a correspondence with Dr. E. W. Hilgard who at that time was the head of the agricultural department of the state university and the director of the state experiment station. Throughout the preparation of the proposed bill, or draft of the proposed law, we acted under the advice of Prof. Hilgard and with his helpful cooperation.

"Our committee obtained copies of the fertilizer laws then in force in the states of Massachusetts, Rhode Island, New York, Ohio, West Virginia, Georgia, Florida and New Jersey. When we came to study and compare these laws of the older states we found a striking similarity in their general provisions, both in the requirements and in the manner of enforcement. Our task then became one of less difficulty than we had anticipated, for we learned by correspondence with the authorities in the older states that their fertilizer laws were in most respects effective and satisfactory, and we came to the conclusion that similar provisions would apply in California. I will say that our existing law as finally passed was patterned quite largely after the law then recently enacted in West Virginia, and which contained more stringent requirements to be observed by the manufacturers of commercial fertilizers than those of any other state.

"We finally got the proposed enactment into a shape that met the approval of the committee, and then after submitting it to Prof. Hilgard and after inevitable minor changes and modifications, we were prepared to fully endorse it and to go to the people, particularly to the fruit growers, for their endorsement. I went before the convention of Farmers Clubs which met at Santa Ana on December 19, 190 , presented our proposed bill and asked for the approval of the bill and for the endorsement of the convention.

"The convention after satisfying itself that the bill was a good one gave it unanimous approval and a strong endorsement.

"It is not a very difficult matter to frame a law such as this, but it is a totally different matter to get the proposed bill enacted into a law by the legislature of the state. The fruit growers of Southern California were most fortunate in having in the legislature during the following session a champion in the person of Wm. A. Johnstone of San Dimas. It was Mr. Johnstone who fathered our bill, who introduced it, and who finally summoned to its support the best element of the legislature in sufficient strength to overcome the opposition. It is a remarkable thing that a young man during his first session could have won the recognition that was accorded to Mr. Johnstone. It was due to his efforts more than that of any other one man that the fertilizer law was placed upon our statute books. And as Mr. Johnstone was a member of this club we have every right to count this law among the achievements of the Claremont Pomological Club."

Tribute to Dr. Cook and his life history were given more completely by Charles C. Teague of Santa Paula, from which we take the following short paragraphs:

"For nearly 50 years Dr. Cook unselfishly served the agricultural interests of the United States. By reason of his education and scientific training he was unusually well fitted to perform the splendid service which he gave the country during this period. His college degrees were: Bachelor of Science, Michigan agricultural college, 1862; Master of Science, Michigan agricultural college, 1865, and Doctor of Science, Michigan agricultural college, 1905. He was also a student at Harvard from 1867 to 1868. He was a professor of zoology and entomology in Michigan agricultural college from 1868 to 1893; curator of the general museum, Michigan agricultural college from 1874 to 1879; entomologist of Michigan agricultural experiment station from 1888 to 1891;

TIMKENS MEAN - MORE *and* BETTER FARMING - BY POWER

Fifty Seven Million Proofs That the Principle Is Right

Since that day more than twenty years ago when a Timken Tapered Roller Bearing was first installed in a motor vehicle, the principle of Timken Taper has remained unchanged.

Yet during those years, American and European manufacturers have used more than fifty-seven million Timkens. And, as far as we know, not one of those fifty-seven million Timken Tapered Roller Bearings has ever been replaced by any other bearing.

Fifty Seven million Timken Bearings! Twenty years of service! Not a single Timken that we know of replaced by any other make! Hardly a tractor, truck, or automobile in America today that does not boast of its Timkens!

Could one ask for more convincing evidence of the correctness of the principle, design, and construction of Timken Tapered Roller Bearings?

Because of their superior ability to carry *all* loads no matter from what angle they are applied—

because they carry those loads with *negligible friction loss*—

and because, when the inevitable wear that *must* follow motion does come, a simple adjustment or take-up easily and quickly made, makes them function as if they were new, Timken Tapered Roller Bearings increase efficiency and reduce upkeep whenever and wherever they are used.

Thus do they play their vital part in the development of More and Better Farming by Power.

and professor of biology, Pomona College, 1893 to 1911. He was also conductor of the University of California agricultural extension work from 1894 to 1905.

"For over 40 years he was an enthusiastic conductor of farmers' institutes and clubs. His activities as an author and in farmers' institutes gave him a nation wide acquaintance which brought him a large volume of correspondence on a great variety of subjects. No one ever addressed an inquiry to Dr. Cook which remained unanswered, even in the later years of his life when his health was poor; when he should have taken a much needed and well earned rest, he insisted on attending to correspondence even if it were necessary to burn the midnight oil to do so.

"It was appropriate that such a man as Dr. Cook should have been called to serve the state of California as its horticultural commissioner, which appointment he accepted and entered upon a work which many of his friends consider the crowning work of his life.

"Dr. Cook's capacity for choosing the right man for the right place is evidenced by his untiring efforts to secure for the public service in California such men as Dr. H. S. Fawcett, Harry S. Smith, Geo. P. Weldon, E. O. Essig, C. F. Baker and R. S. Vaile."

HUGE TONNAGE BY WATER

Returning from an extensive trip through the Northwestern states, C. S. Whitcomb, vice president of the California Fruit Growers Exchange, and chairman of the committee on water transportation, reports great progress toward securing refrigerated space on steamers between the Pacific and Atlantic coasts.

The assured cooperation of the large tonnage shippers in both fruit and vegetable lines on the coast has proven to the shipping interests that the producers of foodstuffs are very much in earnest in trying to avoid prohibitive transcontinental rail rates by using the all water routes, it is stated.

Several shipping concerns are now working upon methods for the installation of refrigerated space on steamers which now have only ventilated compartments and one other line is considering entering the field with ships reconstructed and refitted with refrigerated compartments designed especially to meet the needs of the perishable fruit shippers of the Pacific Coast.

Growers in apple districts of Oregon and Washington are in hearty accord with the plans of the California citrus fruit growers and vegetable shippers to facilitate year round shipments by the all water routes. According to statements issued by the various apple interests of the Pacific Northwest, they now stand ready to furnish a guarantee of 70,000 tons in apple shipments per year out of the port of Seattle, thereby assuring their cooperation with the citrus growers of Southern California when they agree to ship 70,000 tons of citrus fruits from the port of Los Angeles.

LEMONS SHIPPED BY WATER

In a publication of the U. S. department of agriculture it is reported that "The initial shipment of citrus fruit from California by the water route was made in January and was accompanied by a representative of the department. The cargo in this case was loaded at Los Angeles and sent to Philadelphia and Baltimore, where it arrived in a highly satisfactory condition A prejudice exists against cold storage lemons, so this fruit is usually transported under ventilation without refrigeration. Carrying lemons through the heat of the canal zone without refrigeration constitutes a severe test. This, combined with the fact that the trip lasted 22 days, gave ample opportunity to study the limitations and possibilities of the water route. Conclusions indicate that it may be possible to transport lemons by this method, but that refrigeration will be desirable for the proper shipment of oranges."

Manager Powell estimates that it will be possible to ship at least 10,000 boxes of citrus fruits by Panama.

NOTICE

We have just closed the most successful tree, shrub and plant selling season in the life of this Company.

We have on hand for delivery in the winter and spring of 1921-1922 a magnificent stock of deciduous and evergreen ornamentals and fruit bearing trees.

We have a complete assortment of potted plants for planting during the late spring and summer months.

THE AUTO-OILED AERMOTOR
A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

A year's supply of oil is sent with every Aermotor

TOP-WORKING FIG TREES

By Ira J. Condit

In California there are doubtless hundreds of fig trees which serve no useful purpose, except possibly as shade or ornament. Caprified fig trees are found in yards where some edible variety of fig is desired. Adriatic and Calimyrna fig orchards are planted in situations where profitable crops rarely if ever can be expected, but where the Mission or Kadota would pay handsomely. Odd varieties bearing fruit of no value except for bird feed are frequently seen.

Such trees need not be maintained at a loss or be grubbed out as cumberers of the ground. They can be worked over to a good variety of edible or caprifig which will produce fruit for one's children and grandchildren. The best season for this top-working is just at hand although it may be done successfully in most parts of the state for some time to come. The following account of methods is offered as a guide to owners of such trees.

Budding

Young fig trees can be most readily worked over by budding, the common shield bud being used. In branches from one to three years old the buds, cut large for the older limbs, can be readily inserted any time the bark is slipping freely. This means practically any time during the growing season from March until October.

Buds inserted early in the season can be forced out by cutting back the stock and a good growth from the bud secured the same year. Buds placed in September or October will remain dormant until spring and must risk damage from cold and wet weather. It is remarkable the ease with which buds can be placed in young trees in September even on unirrigated land.

The buds are cut from succulent wood of the previous season's growth if spring budding is practiced and from plump buds of the present season if fall budding is done. Do not use buds from the base of the stick where the eye is not green and plump. Make as small a "T" shaped cut as possible and let the bud push its own way down at the base. Wrap with ordinary three-ply cotton string and leave for about three weeks, when the strings can be cut. The stocks must be partly cut back in order to force out the buds; it may be advisable to leave a safety branch or two to prevent too rapid growth from the buds.

Budding, however, is applicable only to young trees and to sprouts from older trees. Grafting is therefore the usual method used for top-working large trees.

There are several methods which may be used, but we shall mention three only — the cleft or split graft, the wedge or insert graft, and the bark graft.

In cleft grafting the stub or stock is split through the middle and two scions inserted, one on each edge of the split. This method is commonly and very successfully used on deciduous trees. It has the serious objection, however, of necessitating a split in the stub which is often hard to fill in with wax and is hard to heal over.

Fig scions are usually thick and require at least a quarter-inch split in comparison with peach or apple wood which can be cut thin. The cleft graft therefore is not advised for top-working figs.

Bark Grafting

Bark grafting is very similar to budding except that a scion is used instead of a bud. The work is best done in March whenever the bark is found to slip freely. Any limb of an old tree may be grafted provided it is healthy and not sunburned. Such limbs are cut back to stubs and the scions inserted around the edge, the number depending on the size of the stock.

The scions are cut with a sloping cut along the lower end in the same manner as for a whip graft, then a "U" shaped piece of bark the same width and length as the cut on the scion removed from the edge of the stub. In some cases the flap of bark is left.

The scion should then be inserted snugly into the opening in the stock so that the bark on each side of the scion touches the bark of the stock.

RUST

WILL RUIN!

YUCCA MANUFACTURING CO.
1380 Willow St. Los Angeles, Ca

When writing advertisers, mention the Cultivator

After a sufficient number of scions are inserted in the stub they should be tied firmly in place with strong cotton twine.

All exposed surfaces are then covered thoroughly with grafting wax. The bark of the exposed stubs and trunk should be whitewashed to prevent sunburn. It is desirable that a number of scions grow on each stub for a year or two until the end of the stub heals over, after which the scions can be thinned out to the desired number.

Nails Often Used

In bark grafting some workmen use small finishing nails or brads to tack the scions to the stock, but string is used as well to hold them in place firmly. Scions, however, can be easily inserted only when the bark is slipping. The operator, however, cannot always strike the favorable time in which the work can be done. The scions moreover often fail to become firmly attached to the stock and break out. The wedge graft is therefore often used to give a firmer union.

Wedge or Insert Grafting

In wedge grafting the stock or stub is prepared just as in bark grafting. A "V" shaped piece of wood is sawed or cut from the edge of the stock and the edges smoothed with a knife. The scion is then cut on one side into a wedge shape so that it will fit snugly into the notch in the stock.

While this operation sounds difficult, a little experience will soon enable a workman to get good results.

It is the method advocated by G. P. Rixford. If the scions and the stock are properly prepared for wedge grafting the scions do not need tying as they are held in place by the wedge and the wax.

Cutting Scions

There seems to be a difference of opinion regarding the proper time to cut scions for grafting. One person with considerable experience insists upon cutting them in January or February and heeling them in sand so they will become "hungry" and keep dormant. Another operator with extensive experience in grafting all kinds of fruit trees cuts his scions at time of grafting or only a short time previously if he has to get them from a distance. In fig grafting it is essential to success to use two year old scions or scions in which the proportion of pith is small. When such scions are used they can be cut fresh and set immediately with good success.

Ruins of One of Nature's Work Houses of Millions of Years Ago

One view of the pits or quarries where nature stored up lime for use on twentieth century orchard soils. These quarries are located in the hills just south of Lomita and not far from Los Angeles Harbor. Thousands of tons have been placed on Orange County soils and run down orchards are showing wonderful renewal of vitality, with yellowed leaves turning to the dark green color of health. This is the deposit of decomposed marine shell with which are mixed decomposed bones of prehistoric animals. Some of these bones have become petrified and are being sought by scientists who are constantly watching the development of the quarries.

Fruits and Nuts: Then and Now

By Prof. M. E. Jaffa before Claremont Pomological Club
(Continued from last week.)

It should be said at the outset that certain unknown essentials have no direct relation to the ordinary nutrients such as protein, fats, carbohydrates and mineral matter. Osborne and Mendel, McCollum and others, found that diet of purified food substances, that is, purified protein, fat, such as lard, carbohydrates and mineral salts, was inadequate for the promotion of normal growth and development in rats. When butter was substituted for lard in an otherwise satisfactory diet the rats developed normally. Here, then, was another unknown dietary essential furnished by the butter, termed by some "vitamine," by others, "growth promoting substance."

The three terms, then, "anti-scorbutic vitamine," "anti-neuritic vitamine," and "growth promoting substances," are not the only designations that have been proposed or suggested. Others are, "growth substances," "growth determinants," "food hormones," "accessory food substances," "dietary essentials," "fat-soluble vitamines," "water-soluble vitmines." It has been quite clearly shown that there are two groups of these so-called "vitamines," one soluble in fat and one soluble in water. The latter again have been divided into two sub-groups, anti-neuritic vitmines, fairly widely distributed in plants and necessary to prevent polyneuritis and beriberi, and the anti-scorbutic vitamine so necessary for prevention of diseases like scurvy. There has been suggested, therefore, the provisional name "fat-soluble A," "water-soluble B" for the anti-neuritic vitamine, "and "water-soluble C" for the anti-scorbutic vitamine. All three are necessary in the diet for optimum growth and normal development of the young and for the maintenance of health and activity and ability to work in the adult.

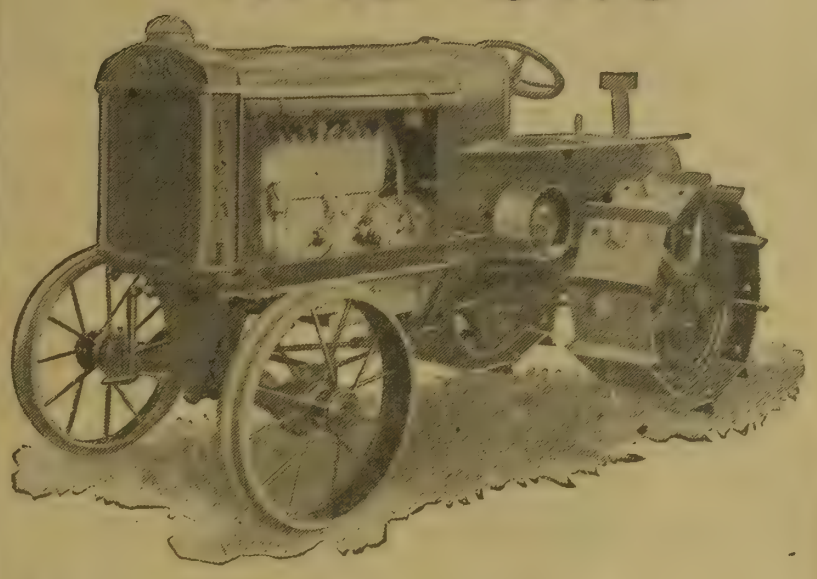
It is of interest to relate the foregoing discussion to fruits. **Fruit** has long been used as a food for **man** but it is only of recent years that the role of fruit in nutrition has been appreciated, and this is due entirely to the investigations above referred to.

The compostion of fruits as determined by chemical analysis, indicating the percentage of the several nutrients, including mineral matter, has been well known for many years, but the character and importance of the latter were not until recently properly recognized. The predominating ingredients of the ash or inorganic part of fruits are potash, soda, lime and magnesia. These are basic in character and tend to balance the chief ingredients of the cereals, meats, etc., which are of an acid nature, namely, phosphorus, sulphur, chlorine, etc.

It is thus seen as a result of the modern investigations that there is a fuller appreciation of the value of fruits as a source of mineral matter

(Continued on Page 663.)

TIOGA
STRENGTH TESTED TRACTORS



Have You Seen the TIOGA P-T TRACK TRACTOR

It is the Tractor you would build for yourself. THE POSITIVE TRACTION Track is the most desirable improvement in tractor construction made in two years and it is the most desirable, durable, efficient and economical traction under all conditions that has been manufactured.

Your knowledge of tractors is not complete until you have examined TIOGA construction. Every part of a TIOGA tractor represents the same high skilled engineering as the advanced ideas brought out in the Positive Traction Track.

Whether you farm 10 acres or 1000 acres you should have a tractor of sufficient power to handle your maximum load. PLOW DEEP. The ground is yours as far down as you want to go and the **valuable** elements in the soil below the level of shallow farming are **lost** unless you cultivate them into the reach of crop roots.

With a TIOGA tractor you can plow deep with three fourteen inch plows. You can operate an 8 ft. or 10 ft. double disk harrow and cover approximately 20 acres per day with an 8 ft. harrow. In orchard work you STAY ON TOP OF THE GROUND WITH THE POSITIVE TRACTION TRACK and DIG INTO THE SOIL WITH WEIGHTED DISC, HARROW OR OTHER IMPLEMENT AS FAR DOWN AS YOU WANT TO GO AND STIR IT JUST THE WAY YOU WANT IT.

As an investment you cannot buy any farm implement that will deliver more in return than a TIOGA STRENGTH TESTED TRACTOR. If you want to do commercial work, TIOGA construction enables you to do anything that a tracklayer or wheeltype tractor will do. TIOGA OWNERS are making from $30 to $50 per day with plenty to do, operating their TIOGA tractors. They soon pay for themselves and the construction is of such high quality that the depreciation is exceedingly low.

Whether you are interested now or later let us send you more information about the TIOGA P-T TRACTOR.

See the Tioga P-T Tractor at the Anaheim Orange Show, May 17-22

Let your next tire be

FISK

Trade Mark Reg U.S Pat Off.
Time to Re-tire?
(Buy Fisk)

We Believe in Equity For the Farmer

In tires, our idea of equity is to build a casing definitely for the rough, all-around use a farmer must give his car, at a price which makes rough driving cost less per mile.

We have done that in the Fisk Red-Top, and we are frank to say that no tire can give a higher average mileage under the severe test of a farmer's work-a-day driving.

It is made extra strong with an extra ply of fabric and a heavy tread.

It is a tire which need not be coddled — one from which you may properly expect the excess mileage true of all Fisk Tires.

Our 140 branches enable your dealer always to have in stock fresh tires of this year's building — and every one has the stamina for a surplus of lively miles.

Control of Potato Diseases

THE treatment of seed potatoes with formaldehyde or with corrosive sublimate has been recommended for many years as a preventive of scab and other diseases carried on the tubers.

Such treatment is, on the whole, profitable, but has several limitations which should be clearly recognized to prevent disappointment. The object of disinfecting seed potatoes is to destroy the germs of scab and other surface parasites which might otherwise be planted with the seed and infect the new crop. Only surface infections are reached by this method. It is only partially effective against deep pits of common scab. Formaldehyde is less effective than corrosive sublimate against the black sclerotia or resting bodies of rhizoctonia, or russet scab, and against powdery scab. Neither chemical, as ordinarily used, will destroy silver scurf. Either one will kill surface infections of blackleg, but neither will reach the internal infections common in tubers from blackleg hills. Neither fusarium wilt nor late blight infection in potato tubers can be reached by any seed treatment, nor can any of the non-parasitic diseases of potatoes, such as mosaic leaf roll, and curly dwarf, be prevented.

Clearly, therefore, the most important precaution against these diseases is to select clean, disease free seed potatoes from healthy, vigorous plants, as determined by field inspection during the growing season and at harvest. Seed treatment should then be applied as an additional precaution. It will not be effective, however, if the soil where the potatoes are to be planted is already full of disease.

Soil Conditions

Soil conditions have an important relation to potato tuber diseases, and many of these are widely spread throughout the country, perhaps native to some soils. Common scab is favored by a neutral or slightly alkaline soil, and seldom gives thouble in acid soils. It is therefore increased by liming and by fresh stable manure, wood ashes, and alkaline fertilizers, such as nitrate of soda and ground bone, while acid phosphate and sulphate of ammonia tend to diminish scab.

Rhizoctonia occurs to some extent in nearly all soils, but appears to attack potatoes most when the conditions are unfavorable to the best development of the potato plant. Bring the land to an ideal state of tilth to minimize loss from rhizoctonia.

Powdery scab is worst on cold, wet, or poorly drained soils. Blackleg, on the other hand, is carried by infected seed. No potatoes showing a deep brown discoloration at the stem end should be planted.

Sulphur tends to prevent common scab. It is not a substitute for corrosive sublimate or formaldehyde, but is a good drier for cut seed. Applied to scab infected soils at the rate of 500 pounds per acre it reduces the scab, but such heavy applications can not be generally recommended as profitable. Preliminary experimental trials are advised.

Disinfect Seed

The formaldehyde treatment consists in soaking the potatoes, before cutting, for two hours in a solution made by adding 1 pint of formaldehyde to 30 gallons of water. The solution can be used repeatedly. The gas treatment is no longer recommended.

Corrosive sublimate is used at the rate of 1-1,000 for one and one-half to two hours. Dissolve 2 ounces of the salt in hot water and dilute to 15 gallons. This is a deadly poison. Use with great care. It must also be kept in wood, porcelain, or glass vessels, as it attacks metal. It is more effective than formaldehyde, particularly against rhizoctonia and powdery scab. Do not use the same solution more than three times, as the strength diminishes with each lot of potatoes soaked.

To treat large quantities, set several barrels on a slightly elevated platform. Fit a plug in a hole in the bottom of each barrel, fill with potatoes, cover with solution, let stand two hours, draw off solution, and pour into another barrel. Increase the number of barrels in proportion to the quantity to be treated. Another method is to use a large wooden vat or trough, into which the potatoes in sacks are lowered by a rope and pulley and later hauled out, drained and dried on slatted racks.

Seed potatoes may be treated several weeks before planting, provided they are not reinfected by storing in old containers or storage bins.

Sprouted potatoes are injured by treatment, but will throw out new sprouts. In general, however, potatoes will not be injured by following the above directions. Many growers believe germination is improved by treatment.

IRRIGATING BEANS

Please give me your advice on irrigating pink beans. When is the best time to irrigate them, before they blossom or after?—Subscriber, King City.

This is rather a vague question, for practice necessarily varies with soil, climate, etc. If soil is in good shape, sufficiently moist when planted, it is usually unnecessary to irrigate again until pods "begin to fill." This is, of course, some time after the blossoming. In soils that dry out quickly the waterings should be given as needed. There are no don'ts on irrigation, but after the blossom period do not cultivate deeply. We have known a promising crop to prove a total loss by such disturbance of the roots just as young beans were forming.

FROSTED POTATOES

A potato grower of prominence was asked about the effect of frosted tops upon the crop. He replied that he believed tops cut down early would not result in crop loss. They will always grow again and the general effect will be as though the potatoes were planted at time of frost. This might subject the crop to whatever of harm comes through late planting, nothing more. He further stated that if potatoes had begun to form, no matter how small, when tops are lost through any cause no crop at all will be had, for there would be no leaves to manufacture plant food for the tubers. Loss of top at or near this time would doubtless cause a total loss. But the same injury before the time noted would allow of some degree of recovery. The younger the tops the greater and more rapid would be such recovery.

BONES OF CAESARS

By Ernest Braunton

Persia's most famous poet wrote:
"I sometimes think that never blow so red
The rose as where some buried Caesar bled."

Down at Torrance, Los Angeles County, on the property of the Torrance Lime and Fertilizer Company workmen have for weeks been unearthing remains of gigantic prehistoric animals of the same species whose remains are found in Hancock Park in western Los Angeles, embedded in asphalt. At Torrance the bones are found in large masses of a composed marine shell lime. Imperial elephants more than a dozen feet high, saber tooted tigers, huge wolves and other quadrupeds have mingled their remains with those of prehistoric whales, sharks and other denizens of the deep. Of late several bones of mankind have been found. The composite dust now goes to make "the rose so red," to fatten the orange trees and make fertile the fields. "To what base uses do we return, Horatio!"

Some cotton was sold recently in the Salt River Valley for 28 cents and 30 cents. Most farmers are holding back, waiting and believing that the price will go higher. It is considered encouraging that buyers are in the market at any price as up until a short time ago there were no offers.

Maricopa County, Arizona, hay growers have effected an organization, with Fred Tait, president of the farm bureau, as temporary head.

VIKING PUMPS

Save at the Fountain Head

Sizes:
10, 20, 35, 90, 300,
450 and 1,050 gals. per min.

THE VIKING will save 20% in power costs as compared with the average stock pump of the same size and capacity. Reason: Rotary principle—no unnecessary waste of power. Easy to install; no priming pump or foot valve required.

Catalog Upon Request.

Save Money—Buy Pipe From Us

Farmers, Miners, Builders — people in every kind of business are saving money buying used or renewed pipe from us. We sell every kind of pipe. Send in a list of your requirements today and get our prices. We have saved hundreds of people 33 1-3 to 50 per cent on their pipe bills. Here's a partial list of some of the miles of pipe we have in stock for immediate delivery.

8,000 ft. 6 inch Riveted 16 Gauge
700 ft. 8 inch Riveted 16 Gauge
5,000 ft. 12 inch Riveted 12 Gauge
1,000 ft. 18 inch Riveted 12 Gauge
800 ft. 22 inch Riveted 14 Gauge
300 ft. 24 inch Riveted 14 Gauge
500 ft. 36 inch Riveted 12 Gauge
10,000 ft. light wrought iron 8 inch pipe with cast iron collars.

All above pipe thoroughly overhauled and inspected and ready for immediate use.

We also have large quantity standard pipe and screw casing, pressure tested and guaranteed.

Don't delay—write for our prices on your pipe requirements today.

CALIFORNIA TRACTOR AND IMPLEMENT ASSOCIATION

The two tractor associations which have been very effective in boosting the tractor game in California have decided to close up shop and a new combined association is now being perfected. Meetings have been held and the temporary officers elected at the meeting in Fresno are:

President, C. L. Butler; vice-president, Robert Killefer; secretary, George Collins; chairman board of directors, W. E. Shepherd; directors, W. G. Criswell, J. F. Griswold, Robert Killefer, Ben Root.

Later the temporary board of directors met in Los Angeles, adopted bylaws and placed in nomination for permanent officers of the association the following:

President, W. E. Shepherd; vice-president, B. L. Graves; treasurer, George Wheeler; directors, C. L. Butler, W. G. Criswell, J. F. Griswold, O. P. Robb.

The membership is divided into ten departments, as follows: Manufacturers, branch houses, jobbers, dealers, lubricating oils, pumps and irrigation, farm press, accessories, farm lighting, dairy supplies.

LEGISLATIVE PROGRAM OF AMERICAN FARM BUREAU FEDERATION

A repeal of the guaranteed railroad rates and a lowering of freight rates.

The same tariff protection for the farmer as industry enjoys.

Retention of the excess profits tax; opposition to the general sales tax; opposition to the proposed one per cent federal excise tax on land.

Commodity financing on warehouse receipts; livestock financing on the proper pledge; personal rural credits secured by proper insurance features; use of federal reserve profits in a revolving fund to provide working capital from date of application for loan until sale of debentures; increase of maximum federal farm loans from $10,000 to $25,000.

Fair and just packer regulation, vested in the United States department of agriculture rather than a separate commission.

These plans make up the legislative platform of the American Farm Bureau Federation as adopted by the executive committee after a fortnight's session in Washington. In outlining the legislative program careful consideration was given to the views expressed by various government officials and experts as well as to the mind of the farmer expressed by delegates from the state farm bureau federations.

THE EXASPERATING ANT NUISANCE

Although spring brings much happiness and joyful feeling to people generally, it is always accompanied by one intolerable aggravation to the housewife—the pesky ant. There was a time when all one could do was to "grin and bear it," but now the eradication of the ant is a comparatively simple matter. Or, if he can't be eradicated, he surely can be very materially reduced by the use of remedies which may be had in every market. The best of it is the ant often takes to some of these remedies, carries it as food back to his nest and fails to return for more.

If not controlled by some of these easily available remedies ants may become an awful nuisance and even cause great financial loss.

Only a few cents and a little persistence will bring relief.

TRACTOR DEMONSTRATIONS

The National Implement and Vehicle Association, or rather its tractor demonstration committee, has reported unanimously in favor of a number of demonstrations to be held during the coming season, the number and place to be determined by the committee later. This committee consists of the following members: J. B. Bartholomew of the Avery Co.; E. J. Gittens, Case Threshing Machine Co.; C. B. Sharpe, Cleveland Tractor Co.; Harry Bates, Bates Machine Co.; J. A. Everson, Internati nal Harvester Co.; G. I. Giellette, Minneapolis Steel and Machine Co.; Donald McDonald, Avery Co.; F. O. Mount, Advance Rumely Co.

The Aldrich:

A piano that we can recommend, at a price certain to be attractive

SHERMAN, Clay & Co. take pleasure in calling to your attention the Aldrich piano—either upright or grand.

The Aldrich is modestly priced, but it is not a "cheap" piano.

It is made for us, in factories selected by us, and its performance in the homes of its purchasers is to us a matter of pride and interest.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Rooting Roses

Will you please tell me the right time of year to root rose cuttings, or can they be rooted any time of year? What part of bush is best for the cutting?—Subscriber, Glenn County.

We have had excellent results in rooting roses which were cut late in the month of September or during the month of December. These were ripened wood cuttings the size of lead pencil or perhaps 12 inches long. These cuttings will make a showing of roses during the next spring. They root more satisfactorily in warm sandy loam. Presume the cuttings could be taken at any time the parent plant is dormant. In fact the rose is so hardy that we have seen cuttings taken in nearly all stages of growth which have grown but in much lower percentage than where plant is dormant.

Strawberry Red Spot

On page 585 of the Cultivator of April 30 I notice an item headed "Strawberry Red Spot." I am of the opinion that if "Subscriber, Denair" will examine his diseased vines very closely he will find imbedded in the the heart of the root a very diminutive worm or weevil. And the only remedy known to me is to pull the vine and destroy it, being very careful not to scatter the soil immediately around the root. Burn every vine or plant as soon as it is known to be affected. The pest (if I am right in my diagnosis of the case) works in the ground and no spray of any kind will have any effect. I think the sooner Mr. Subscriber gets busy and the more "heroic" the treatment the better it will be for his plants.—W. H. Gunsolus.

Lettuce—Garden Seed

Would like to know if lettuce will make heads again after the first crop is taken off. When garden seeds are soaked is hot or cold water used?—Subscriber, Yuba County.

Lettuce has no second crop. Some varieties of cabbage do, of which the well known Cannonball is a good example, the second crop occasionally bringing more money than the first, though commercial growers do not plant with such expectations. Vegetable seeds are not soaked in common practice, except in Bordeaux or a similar mixture, to prevent fungous diseases. Soaking in water invites fermentation and fungi and while practiced by a few is not recognized as desirable.

Thompson Seedless Near Coast

Can you tell me through the columns of the Cultivator of anyone having experience with Thompson Seedless grapes seven miles from the coast? I am going to shade them with burlap from the salt air and see if that will be of any benefit.—Subscriber, Del Mar.

The difficulty you will have, if any, will be from mildew, provided, of course, you protect them from excessive wind. The Thompson will probably do as well as any of the European grapes under coast conditions, but you might experience some difficulty if you attempted to make raisins.—F. K. H.

Ripe Avocados

How does one cure avocados after they are picked from the trees so that they will become soft or ripe and fit to eat.—Subscriber.

If the fruit is not softened and butterlike within ten days from picking it was probably picked too green. In that case it may soften somewhat but instead of being like butter it is more like leather. There is no curing required.

Dip for Potatoes

Kindly advise what proportion of formaldehyde to use for treating seed potatoes; also how long to leave in the solution. How long should they be treated before planting?—Subscriber, Carson City, Nevada.

Formaldehyde one pound, water 30 gallons. Immerse for two hours. Seed may be planted as soon as thoroughly dried or held for several weeks provided they are not reinfected by storing in old containers.

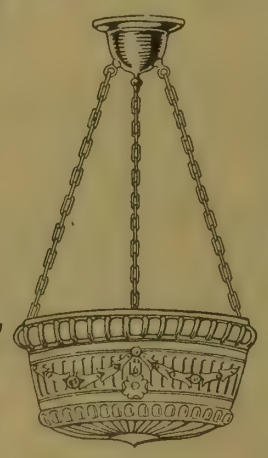
Cane Berries

Can you give me some information about the Cory Thornless blackberry; how long before it bears? I had them set a year ago but they show no bloom this year, while the Burbank Thornless planted the same time is setting fruit. Should the Cory be handled any different from any common blackberry? Which berry is considered the most profitable here in California, the blackberry or red raspberry, and what variety of raspberry is grown commercially? I want a good berry for local trade.—Subscriber, Los Angeles.

You or the dealer must have mixed your labels as the Burbank is notoriously unfruitful as compared with the Cory. The heaviest grower of cane berry plants in Southern California, who supplies nearly all local dealers, is this year discarding the Burbank Thornless blackberry after several years' trial. It really is thornless, also nearly fruitless. It grows tons of wood but little fruit. Some growers believe that heavy pruning might result in a fair crop. Cory Thornless is a good yielder and practically thornless. Occasionally a cane will produce a few thorns. While a thornless berry plant is much to be desired and may prove the most generally satisfactory, the record for yield is held by the Himalaya. On the other hand the thornless crop is more easily and quickly harvested and all berries are recovered by the average picker. Choose for yourself. The best standard raspberry is the Cuthbert. Of late years the St. Regis has come to the fore on account of yielding a light crop the year of planting, if strong canes are planted early. Experienced grow-

Electrical Supplies at lowest prices!

Here are a few typical prices that show you the money we save you on all kinds of electrical goods. Remember we carry a complete electrical stock wire, lamps, insulators, fixtures, appliances, fans, etc.



This Fixture $3.75

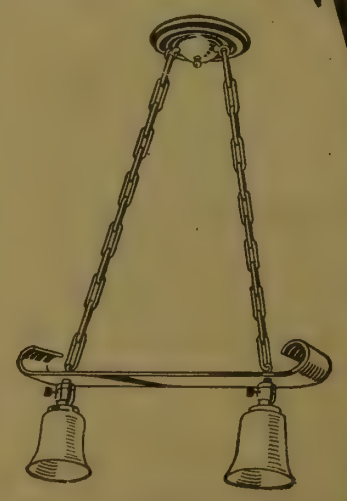
—The popular 2-light bar fixture that's suited for almost any room. Hangs 36 inches from ceiling. Chains and metal parts are finished in "brushed brass"—all wired complete ready to hang, $3.75.

Bowl Fixture $12.00

—A handsome semi-indirect lighting fixture (No. 914A) has white glass bowl patterned like picture—hangs 36 inches from ceiling—metal is "brushed brass" finish. All complete ready to hang, $12.00.

No. 14 House Wire $1.00 per 100 ft.

No. 14 Outside wire	$1.00 per 100 feet.
Split Knobs	$3.75 per 100
Concealed Rosettes	20c each
Key Sockets	35c each
Flush Switches	40c each
Loom	4c foot
10, 15, 20 and 30 Amp. Plug Fuses	2 for 15c
Entrance Switches	85c each
Arrow Transformers	$1.50 each
Electric Door Bells	65c each
9-inch Electric Fans	$11.00 each
Cleat Receptacles	20c each
Lamp Cord	$2.50 per 100
Solid Knobs	$2.50 per 100



6-lb Electric Iron $5.00

An iron that's fully guaranteed; has split plug to screw into socket, making it easy to disconnect, and a handy switch in the cord so you can turn off heat without disconnecting iron; weighs 6 lbs.

Write for our Special Condensed Electric Catalog "A"—It's FREE, shows a big variety of fixtures and electrical supplies.

Everything for your Building

Whiting-Mead Comm'l. Co.

415 EAST 9TH. ST. LOS ANGELES

ers say there is little choice between the two and many commercial growers still stick to the old standard. Blackberries are several times as profitable as raspberries, according to several leading growers.

Salt Spools

Please give me information as to how to make salt spools for cattle. We can only buy the salt lick in blocks here.—Subscriber, San Jose.

We do not know of the "salt spool" being used in this state. So far as we know it is a commercially made proposition. If, however, any of our subscribers can give suggestion for our San Jose inquirer we will appreciate it. We believe the generally preferred method of salting stock in California is to use the mineral rock salt.

Mildew on Roses

Questions continue to come as to control of mildew on roses. The season has favored both of these pests. The simplest aid in control of the mildew is liberal use of best quality of sulphur. In good hot weather this is very effective. If, however, the roses are on the shady side of the house, or if continual foggy or moist weather prevails, the dry sulphur is not so effective. In such case one may spray with weak lime-sulphur solution, 1-33, or use wet spray of liver of sulphur, 1 ounce to 3 gallons.

Silage and Forage

1. What do you consider the best crop to be planted in the spring to cut and fed green to dairy cows 2. My neighbors insist green field corn dries up cows. Does it? 3. How does Sudan sorghum compare with corn (field) for silage? 4. Would the second growth of Sudan if frosted be injurious to stock?—Subscriber, Julian.

1. Sudan sorghum, believed to be a hybrid. 2. It does not, if fed in proportion. Some feed so heavily of such roughage that the bulk fills the animals and they do not eat enough of concentrated foods. This results in a temporarily decreased milk flow. A return to properly balanced rations will restore milk flow to normal. 3. Sudan sorghum is superior to corn in food value because of heavy sugar content and it yields two crops a year and some winter pasturage. 4. It is doubtful. Growers claim that if frosted and a few warm days come a new growth nearly a foot high will grow in a week. Cattle are turned in to feed upon this and no ill results have been noted.

Caprifigs

I have a white Smyrna fig tree that is loaded with figs that are spongy and dry. They grow to full size and one would think from appearances they were all right.—Subscriber, Corning.

If you really have a Smyrna fig this case is puzzling. Unless pollinated the Smyrna drops off before half grown. We are inclined to the belief that you have a caprifig. The summer crop on some of the varieties, Milco for example, often grows full size seedless spongy figs which are very fair to look upon but of no value. Having the capri, you should now plant one or more Smyrnas.

Avocados and Loquats

Can avocado and loquat trees be raised from seed in nursery rows, and after being budded, transplanted in loose roots or balled the same as citrus trees?—Subscriber, San Marcos.

Avocados should be grown and handled the same as citrus trees, though far larger balls are necessary for good results. The matter of bare roots is difficult of determination from a business standpoint. We do not know of a grower defoliating and handling with bare roots but see no reason why it may not be done if extreme care is used. In early April the writer dug up 16 seedlings from named fruits and mossed the bare roots. They lay three days in package and were planted and shaded by burlap screens. Nearly all are doing well.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Collecting Note

We loaned money on a promissory note which was endorsed by a third party. The note has not been paid. The maker has his property mortgaged. Can we collect the note?—Subscriber, Santee.

You are entitled to bring an action on the note against the maker and endorser. Attachment may be levied upon the real property notwithstanding the fact that it is mortgaged, but on the personal property it would be necessary to discharge any chattel mortgage. An auto is not exempt from execution.

To Recover Tools

I loaned some tools. When I went to get them the borrower claimed that I owed a bill. He kept the tools as security therefor. I paid this bill but he still refuses to deliver. What steps should be taken?—Subscriber, Cibola, Arizona.

It is necessary only to bring an action for replevin, in which you can recover the tools or the value thereof.

Line Fence

What is the rule as to the placing of line fences? — Subscriber, Cibola, Arizona.

With an agreement of the parties the fence may be placed upon the line. Without such an agreement the party desiring to place the fence is entitled to place it just within the line.

Real Estate License

What is the expense of license for a real estate broker and where shall application be made? — Subscriber, Nipomo.

The annual fee for a real estate broker's license is $10. If application is made during the second quarter of the year three-fourths of that fee should be paid. The real estate commissioner has his main office in Sacramento and branch offices at San Francisco and Los Angeles.

Patented Article

Can a person lawfully make and employ in his own use a patented article? —Subscribes, Hughson.

Both the making and use of such patented article without the permission of the patentee would constitute an infringement as it is distinctly provided that any unauthorized making, using, or selling of an invention during the life of the patent is an infringment. Even the making of such invention for amusement or for scientific use, if it is put into actual use, would constitute an infringement.

Diverting Percolating Water

Is the land owner liable for damages if he puts down wells near the line fence of adjoining property and drains the land above of water to pump on his own land? If he sells to another party, will the next owner be liable?—Subscriber, Fallbrook.

In one of the leading water cases in this state it was settled that the owner of soil lying in the belt saturated with percolating water is entitled to a reasonable use thereof on his own land, notwithstanding such reasonable use may interfere with water percolation in his neighbor's soil, but he has no right to injure his neighbors by an unreasonable diversion of water percolating through his land for the purpose of carriage or sale to distant lands.

Sand from River Bed

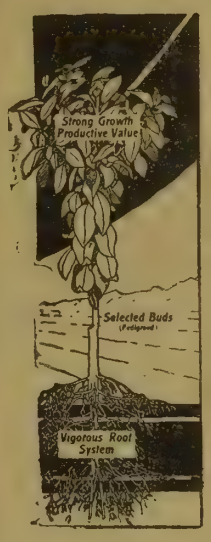
May I take sand from river bed without permission from my neighbor?—Subscriber, Cardiff.

It depends entirely upon whether the river is navigable or not, for the state is the owner of all land below the water of a navigable lake or stream. If it is not a navigable lake or stream then the parties bordering upon such stream or lake are presumed to own to middle or third of the stream. You could not, of course, trespass upon your neighbor's property and take sand therefrom any more than you could take earth from his land, but you certainly could take sand upon your own premises if you did not take it in such an amount as to cause your neighbor's property to sink in. There seems to be no such law interfering with the taking of sand from a navigable stream.

Closing Road

Land is sold with a 40 foot strip along the easterly boundary between that land and another tract owned by the grantor for the purpose of a roadway. Later the grantor sells a second tract to a third party, granting him right of way for road purposes across said strip. The grantee, over whose property the right of way was reserved, later buys from the grantee, in whose favor the reservation was made, the said reservation. Is the property then clear or does the general public, and more particularly a fourth party to whom such road is a benefit, still have the right to travel over and across the strip?—Subscriber, Solvang.

(Continued on Page 667.)



Teague Quality Trees

Grown Right from Seed to Mature Trees

Teague trees are the best that can be produced and have always given satisfaction wherever planted. Poorly grown trees are dear at any price so why take chances on planting anything but the best.

Avocados

Did you see the fine display of fruit at the California Avocado Association meeting at Pasadena?

Everyone should have one or more Avocado trees in their home orchard. We grow all of the recommended varieties.

Feijoas

This very useful shrub should be in every home garden. It is perfectly hardy and the fruit is excellent for jellies and preserves as well as fresh. We have a nice stock of grafted trees of the large fruiting varieties.

Citrus Trees

We still have a good stock of all of the commercial varieties of ORANGES, LEMONS, LIMES and POMELOS.

SACRIFICE

By Edgar A. Guest

There is no easy way to serve.
This life is one of sacrifice.
With courage and with steady nerve,
For conquest each must pay the price.

Who asks must willing be to give.
For friendship man must play the friend.
There is no royal way to live.
On service all man's joys depend.

Skill is a gift which man acquires
By patient practice day by day;
And he who stops because he tires,
Soon falls behind the way.

Time grants us what we gladly earn
And gives to every man his due,
But he who takes must, in his return,
Stand up and play the giver, too.

Not in the drowsy lanes of ease
Are fame or fortune to be found,
But on the hills of drudgeries
And on the rough and stony ground.

How much of self will you bestow?
How do you meet the sterner tasks?
How far for conquest will you goi
These are the questions greatness asks.

WITH PUP'S ASSISTANCE

(Continued from last week.)

"The Peters grove," thought Martha, and to Mr. Burnham she said: "There is a grove next to ours that my brother has been talking of buying. He was telling me about it this morning. He thinks it is a splendid buy. You might talk it over with Phil when we get home. Anyway, possibly he could give you some pointers about orange groves in general. He has made quite a study of them."

"Then I certainly want to talk to him," said Mr. Burnham enthusiastically. But by this time they had reached the little town with its flag and bunting draped streets, and nothing further was said on the subject.

It was a beautiful morning, and the parade went off as scheduled. Then there was some delay while the old veterans were gotten into the trucks and automobiles that were waiting, flag decorated, to carry them to the cemetery, a ten minutes ride from town. And while they waited, Mr. Burnham and his daughter produced a carefully packed and elaborate lunch, which they spread on an improvised table, and they all discovered that even this part of a morning out of doors had given them keen appetites. And while they ate, the autos containing the old heroes had one by one drawn off from the different corners where they had been parked, and our little party suddenly found themselves left behind. They quickly cleared away the remnants of their lunch, everybody assisting, and followed the road the others had taken.

Arrived at the big Sycamore tree, where all Memorial Day celebrations in the little town centered, it was apparent that something was wrong. There was a general craning of necks and an air of disappointment. The chairman of the day's exercises was a stranger to Grandpa, and just as our little party drove up, he had mounted the stand to make the disappointing announcement that the orator of the day had, for some unknown reason, failed to appear. At that moment he saw Grandpa, with his soldierly bearing, and the distinguished looking little party, alighting from an automobile that looked as if it had come a long distance. Not being acquainted with the orator of the day, and in his dilemma making a wild guess, he announced in a big booming voice: "Ladies and Gentlemen, the speaker of the day, Colonel Howson," and led the clapping.

Many of the people in the crowd who knew Grandpa, saw the trend events were taking and good naturedly clapped their encouragement. Grandpa didn't understand it was for him. "Speech, speech!" the crowd called loudly, and the sirens whistled. Finally comprehending the situation, Grandpa modestly indicated that he was not the orator, but the applause grew and grew and the smiling faces all about encouraged him.

"Go on, Father. Make them a speech. You can reminisce about the war, you know. There isn't another man here who can do it as well as you can," and thus encouraged by Martha, he straightened up to his full six feet and stepped onto the platform, but here Pup took a hand. He didn't understand the applause. "What were these people doing to Grandpa," and he jumped onto the platform beside Grandpa and barked his defiance to the whole assembly. "He'd let them know he was here to take care of Grandpa," and he barked and barked. Then he raced madly round and round the platform, barking at every leap. The exciting day had gotten into his spine and now he was just a bundle of excited nerves, and he continued to bark madly, until everybody was laughing at him, still clapping encouragement to Grandpa. Finally he stopped beside Grandpa as Grandpa put out his hand and patted him, finally letting his hand rest on Pup's head. That seemed to reassure him and Grandpa began his reminiscence. He talked well, did Grandpa, especially when he talked of Civil War days, and the people gave him the most flattering attention.

As long as Pup felt Grandpa's hand on his head, he behaved himself, but occasionally Grandpa would forget and lift his hand in an unconscious gesture. That was the signal for more barking from Pup. So the "speech" proceeded, punctuated by Pup's excited barks, which seemed to make the speech more emphatic, coming as they did at all the exciting places when Grandpa would forget and lift his hand.

It was a good speech. Everybody said so, and the crowd pressed around him, offering congratulations. As it was the only speech Grandpa had ever made, he was in an exalted mood, feeling that it was the greatest day of his life. Then the graves of the dead comrades were decorated, and early in the afternoon our little party was ready to start for home.

Martha and George Burnham had found opportunity to talk over old days and renew old acquaintance, and they had made the discovery that the charm each had had for the other in the old days still continued. Both were feeling very young and very happy when they started on the homeward way.

Now that the excitement of the day was past, Grandpa fell naturally into talking about affairs at home, telling Mr. Burnham about the orange grove, and as Mr. Burnham listened he surmised that the financial outlook of the little family was not very rosy. But Grandpa changed the trend of the conversation by remarking:

"This is a beautiful car you have."

"Yes, it's all right," replied Burnham.

"It's a mighty fine way to ride," continued Grandpa.

"Yes; you can get around with an automobile. They're all right. I heard of a California man who said his ideal of life in California was to have a $300 home and a $3,000 automobile. But in my opinion an automobile is a mighty poor substitute for a home. Don't you find living in the country, in an orange grove, mighty satisfactory?"

"Well, yes," replied Grandpa, "but there's lots of work. After all, it's farming of a sort, and you know farming always means work."

"I've always wanted to see an orange grove close up, and if you don't mind I would like to make the acquaintance of yours."

"Of course, it's understood you are coming in." "Yes, indeed," Martha warmly seconded her father. It certainly wouldn't be fair to Phil if you didn't, and you know you are going to get some first-hand information about orange groves."

By this time they were in view of their grove, and Pup, at the imminent risk of breaking his neck, was out in a headlong plunge and racing away to keep his engagement with the gopher. The others followed more leisurely and soon they came upon Phil, hot and tired, but brightening wonderfully at sight of new people. The introductions were acknowledged with unusual warmth on both sides, Mr. Burnham telling Phil of the old time friendship between Martha and himself. Soon Billy came rushing up. "Oh, Daddy! We had the best time. Grandpa and Pup made the speech."

"What are you talking about, Billy," admonished his father.

"Well, Grandpa made the speech, really, but Pup helped him a lot. You

The Cultivator Patterns

3567. Dressing Sack. Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44, and Extra Large, 46-48 inches bust measure. A Medium size will require 3¾ yards of 27 inch material. Price 10 cents.

3588. Dress for Misses and Small Women. Cut in 3 sizes: 16, 18 and 20 years. An 18 year size will require 4⅞ yards of 44 inch material. The width of the skirt at the foot is 1⅞ yards. Price 10 cents.

3580. Girl's Dress. Cut in 4 sizes: 6, 8, 10 and 12 years. Size 8 requires 3¼ yards of 36 inch material. Price 10 cents.

3127. A Splendid Work Dress. Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 requires 7 yards of 27 inch material. The width of the skirt at lower edge is 2 yards. Price 10 cents.

3581. Ladies' Blouse. Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 36 inch size will require 2⅝ yards of 36 inch material. Price 10 cents.

3568-3228. A Smart Costume. Blouse 3568 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3228 cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. The width of the skirt with plaits extended is 2¾ yards. To make this costume for a medium size will require 4¼ yards of 36 inch material for the blouse, and 5¼ yards of 36 inch material for the skirt. TWO separate patterns 10 cents FOR EACH pattern.

2969. Child's Play Dress. Cut in 5 sizes: 2, 4, 6, 8 and 10 years. Size 6 requires 2 yards of 36 inch material. Price 10 cents.

3578. An "Easy to Make" Apron. Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A Medium size will require 4⅝ yards of 27 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PALACE HOTEL RAISIN RECIPES

Raisin Pie

Soak one pound of raisins in water three to four hours; drain off and put in saucepan, cover with water, add rind and juice of half a lemon and a little stick cinnamon, add sugar to taste and boil a few minutes. Stir in while boiling one-half ounce of cornstarch diluted with water. Let cool off before filling in lined pie plate; cover and bake in moderate oven.

Pie Crust: One cup flour, 3 tablespoons shortening, ½ teaspoon salt. Add enough ice cold water to hold together.

Raisin Bread

Twelve cups sifted flour, 8 tablespoons butter, 1½ cups sugar, 2 tablespoons salt, 2 cakes yeast, 2 cups milk scalded and cooled, 1½ cups lukewarm water, 2 tablespoons sugar, 4 eggs beaten, 1½ cups raisins. Dissolve the yeast and two tablespoons of sugar in lukewarm water, then add four cups of flour, the eight tablespoons of butter and the one and a half cups of sugar, after having been well creamed and beaten until smooth. Then cover and set aside to rise in a warm place for about one hour and a half. When well risen add one and a half cups of raisins, well floured, all the rest of the flour, the beaten eggs and salt, and make a not too soft dough; knead lightly. Place in a bowl, cover and let rise again until double in bulk. Mould into loaves, put them in well greased pans to fill only half the size of the pan; cover and let rise again, and then bake about 45 minutes, according to size of mould and oven. To toast: Use a quick fire.

HOUSEHOLD QUERIES

Sending Orange Blossoms East

Is there anybody who would tell me how to keep orange blossoms fresh and fragrant? They will have to travel to Massachusetts and reach there the 1st of June for my niece's wedding. She is very anxious to have a spray of real fresh orange blossoms to tuck in her dress as good luck. It is very late, I am afraid, but I hate to disappoint her. Many thanks in advance, and I also wish to tell you how I enjoy your department. I have found quite a few treasures.—Subscriber, Colton.

Can any of our readers help our Colton subscriber? We do not know of any way in which the blossoms can be sent so far and keep fresh and fragrant. The blossoms may, of course, be dipped in melted paraffine and maintain a perfect appearance, but will not be fragrant. In dipping in the paraffine have it only just hot enough to coat the blossom branch evenly, not hot enough to shrivel or discolor. It will require deft work and much experimenting to attain just this perfect result. As a hint, you will find boxes of these paraffined blossoms prepared by experts at a very slight cost, and it might pay well to buy one of these rather than risk failure in a case of this kind. Another suggestion: Pack in the same box with the paraffined blossoms a quantity of the fresh, fragrant ones. These will not keep their shape, but will retain all their exquisite fragrance and perhaps impart enough to the paraffined blossoms to be satisfactory. It is also possible that some deft work at the other end of the line in pasting faded petals beneath the paraffined ones will carry the true orange blossom fragrance with the flowers the bride wears.

HINTS FROM HOUSEKEEPERS

An Easy Way to Patch

An easy way of putting on a patch without using a needle:

Raise the foot on your sewing machine with the lever and unscrew the nut that holds it in place, then drop the foot as low as it is possible for the nut to hold it when screwed back in place again. This should leave room enough under the foot for your work to be moved freely. Do not move the lever again; leave it up, and you can then stitch in any direction by holding the garment you are mending firmly and pushing or pulling it very gently the way you want it to go. For rough patches or darning I seldom use a needle. I first trim off the rough edges of the rent or worn place, and place the garment in position on the machine then draw the patch piece under it. You can pin it in place if you wish and stitch once around the rent, leaving a margin about a fourth of an inch, which I turn under, and stitch again carefully on the very edge. This can all be done without breaking a thread, and after a little practice a very neat patch can be made.—Subscriber.

SELF CONSCIOUSNESS

People are conscious of themselves chiefly in relation to other people or in relation to certain things that they must do or are expected to do. Self consciousness, then, is simply a consciousness of superiority or inferiority. In either form it is an undesirable trait; in the one case it is obnoxious to other people, in the other it is harmful to yourself.

The self consciousness that manifests itself in a sense of superiority to others, in arrogance and pride, may have solid reasons for existence. Few people are consciously superior without having some advantages in mental or moral or material equipment, but they frequently lose the benefit of their advantage by reason of their objectionable consciousness of it. Similarly the persons who feel themselves superior to the work that they have to do, even though their estimate of themselves may be warranted, are likely to do the work carelessly and churlishly and not so well as less superior persons. On the other hand, the people who feel diffident and deprecatory injure their standing in the eyes of others and tend to disqualify themselves for effective effort; in timidity they shrink from the tasks and the tests that if only they could feel confidence in themselves they could satisfactorily perform.

The habit of measuring yourself with others or with jobs that are to be done is a bad habit. The men who never give a thought to their superiority or inferiority, or to the superiority or inferiority of other men, who take people as they come and deal with them as individual human beings worthy of interest and respect, and who take the tasks and seize the opportunities neither with condescension nor with timorousness, are the most successful men and the happiest and are the truest exemplars of democracy. —Youth's Companion.

Milk has its great value as a food not because of its fuel value, but rather because of its ability to repair waste tissue, to supply material for growth and to keep the bodily machinery in good working order and to keep it running smoothly.

The man who makes the most noise talking makes the least noise thinking.

Advance of Breeding Shown by Jersey Records

Eighteen years of record making under supervision of the state agricultural colleges and recorded by the American Jersey Cattle Club shows that the progress of cattle breeding is aided largely by the testing of dairy cows for production.

Even with more cows being tested in one year than were previously tested in 12 years there is a slight but progressive increase in the production of milk and butter fat.

From 1915 to 1921 there was an average increase of 458 pounds of milk and 24 pounds of butter fat in the records of all cows on Register of Merit test.

The exact figures for this period and for the years preceding are shown in the following chart:

Period	Records Accepted During Period	Avg. Lbs. Milk	Avg. Lbs. Fat
1903 to 1915, incl.	3,708	7,774	414
1916	1,556	7,735	419
1917	2,077	7,962	428
1918	1,909	7,964	429
1919	2,040	8,187	439
1920 (10 months)	4,301	8,232	438

15,591 records, all ages, average 5.35 per cent butter fat.

The uniform production of all cows on test is of particular interest when the number of tests accepted in ten months during 1920 was double that of 1919, and yet the variation in production of both milk and butter fat was comparatively slight, though it was higher in both cases.

The performance records of breed champions have practically doubled since Dollie's Valentine was champion of the Jersey breed in 1899.

Kentucky Agricultural Experiment Station, Lexington, Kentucky.				

Six out of eight cows holding records for their age in the Jersey breed today were tested by working farmers. The production in both milk and butter fat is greater in volume and practically unchanged in percentage. The per cent of butter fat, which fluctuates from year to year, shows only a slight increase in several years.

The records include animals of all ages, which in extreme cases bring in the year's tests of yearlings and on the other hand some mature cows of 20 summers.

In the year 1920 there were 1,459 mature animals tested (cows five years old and over). These cows produced an average of 9,701 pounds of milk and 510 pounds of butter fat, so that it is safe to say that all mature Jersey cows should be capable of making 510 pounds of butter fat in a year in order to measure up to the standard set by cows in that class today.

The average for four year olds is 8,777 pounds of milk and 472 pounds of butter fat; three year olds, 8,042 pounds of milk and 441 pounds of butter fat; two year olds (including yearlings), 6,691 pounds of milk and 356 pounds of butter fat. The Register of Merit requirements are much lower than this, but it seems as though the average animal has a good margin to spare in its record.

Testing of dairy cows has proved itself to be a valuable help to dairymen and breeders, as it has helped to improve production and profit as well as laying a foundation for breeding the dairy herds of tomorrow.—The American Jersey Cattle Club.

COW TESTING ASSOCIATIONS PROVE VALUABLE FOR WESTERN FARMERS

Numerous examples of the valuable work being done by cow testing associations are contained in reports of testers of these organizations sent to the western office of the dairy division of the United States department of agriculture.

According to the reports, marked progress has been made in replacing inferior bulls with high-class pure bred animals. Six of the testing associations, of which three are in Idaho, two in Colorado, and one in Washington, have reached the 100 per cent pure bred bull mark, having eliminated all scrub sires from their herds. Another 100 per cent association was added to the list in January, and several others are getting near this mark.

The Petaluma association has only two scrub bulls left. The dairy department of the local farm bureau of the county in which this association is located has a plan for an animal pure bred bull sale, the first of which was held several months ago. Young bulls out of 400 pound dams and older proved bulls are consigned to this sale by breeders and by dairymen wishing to dispose of bulls which they have used as long as they can in their own herds. The sale was the means of introducing 25 pure bred bulls into the county, and the association hopes by this means to eliminate all scrub bulls from the county and to keep the dairymen supplied with good bulls in the future. Through these sales it also hopes to open a market for proved bulls, and so keep these bulls in service in the county for many years.

The tester of the Skagit Valley, Washington, association reports that the last scrub bull has been "discharged from service." He says also that one farmer increased his production by 12 pounds of fat per cow on 25 cows from November to December by better care and feeding, and adds that this is an easy way of getting 300 pounds of fat more a month without milking any more cows.

The head tester for the Los Angeles association reports an increased production by the 3,000 cows in the association for December, 1920, as compared with December, 1919, which, he says, means an increase of more than $30,000 a month.

One herd of 30 cows in the Orange County association increased its production from 19 pounds of fat per cow in September to 36 pounds in December, largely as a result of advice on feeding given by the tester of the association. This increase of 510 pounds of fat a month is more than some 30 cow herds are giving at this season, he reports. Another herd in this association increased from an average of 27 pounds per cow to 41 pounds in six months. One dairyman in the association culled 13 animals from a 45 cow herd, and by so doing decreased his production only 12 gallons a day but saved over $60 a month.

The tester of the Ada association in Idaho reports that every cow in the organization has been tested for tuberculosis. Every herd in this association is headed by a pure bred bull and 25 per cent of all the cows are pure bred.

CALEDONIA SHORTHORNS

Imp. Caledonia

You Are Invited

to attend our third public sale to be held at the farms, Wednesday, May 25th. We have selected the best lot of material we have yet sold. We want you to come and see the sort of calves our three great bulls are siring—then you will understand why Caledonia calves always top the sale averages. Caledonia calves averaged $2,470 in the Anoka sale; $1,475 in the Lookabaugh sale and $1,487 in the Degginger sale. We believe we have some just as good—and you can set your price in the sale.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Month Old Calf

Please answer this question about a month old calf. Every time she chews her cud green liquid runs from her mouth, about a cupful. We are feeding calf meal and milk twice a day and a small amount of dry alfalfa hay.—Subscriber, Hynes.

Probably there is nothing wrong with the calf. The alfalfa hay may be a little coarse and irritates the tender mouth, causing the saliva to flow freely. If it continues you might examine the teeth to see if one came in crooked or if anything else is wrong in the mouth. Probably some green alfalfa or other green feed would remedy the trouble.

Depraved Appetite

We were raising three lambs by hand and all were doing fine and very fat, but they took to eating dirt and two died. To save the other we keep it in a pen with floor and lead it out for exercise. It is crazy to eat dirt. We keep salt in the pen all the time. Is there something we can feed to keep it from eating dirt, and what is the cause?—Subscriber, San Benito.

It may be caused by stomach worms. Give a teaspoon of turpentine mixed with two or three tablespoons of olive oil once a day for a few days. Also give a teaspoon of phosphate of soda dissolved in half a cup of warm water every morning for a week.

Freemartin

In the Cultivator of April 16 we answered a question regarding sterility of a heifer calf that was a twin with a bull calf. It seems that we were not posted on that subject. The fact is pretty well established that in case of such twins the bull is all right but that the heifer is barren and is called a freemartin. Since the article was published we have received several letters setting us right on the subject, and we wish in this way to thank those who took an interest in the subject and were good enough to write us about it. The object of this column is to give sound advice about animals, and criticisms and corrections are always welcome. Sometimes we have been criticized for not giving the latest known remedy for some disease. Our only defence is that very often if such remedies were prescribed the owners of the animals could not get the remedy nor would they be able to use it if they had it. Instead we try to prescribe something that will do as well and that the owner can get and in most cases knows how to administer. Many of the latest remedies are not in the drug stores, and if they were stock owners could not get them without a special prescription from a registered veterinarian, and then they would not be able to administer them without special instruments.

Paul Popenoe of Thermal writes:

In the California Cultivator of April 16 a subscriber asks whether twin calves are sterile. If the calves are both heifers or both bulls they are ordinarily normal. If one is a heifer and the other a bull the latter is ordinarily normal but in eight or nine cases out of ten the female is barren. Such a heifer is called a freemartin. The cause of this phenomenon has been worked out by several investigators during the last few years. The research of Prof. F. R. Lillie of the University of Chicago is particularly conclusive. He showed that the blood systems of twin cattle usually grow together. Apparently the male embryo secretes some hormone into the blood which, passing into the circulation of the female embryo, tends to prevent the normal sexual development of the famale.—Paul Popenoe, Thermal.

* *

I am a constant reader of the Cultivator and always find solid information in your columns. In April 16 edition, under "Are Twin Calves Barren?" you ask to hear from someone with the facts. Back in the '80's in the "Prairie State" we were raising Shorthorns for stock purposes and in looking over my old records find at least two cases of twins, bull and heifer, and in each case they failed to breed. Our neighbor had the same experience. As these were pure breds they were quite a loss to the breeder. The heifers were called freemartins.—J. N. Sanborn, San Jacinto.

Professor Gordon H. True of the animal husbandry department, University of California, pays the following tribute to J. Henry Meyer, whose death was recently announced in these columns: "In the death of J. Henry Meyer of San Francisco at his home in San Mateo in the early part of April, the Ayrshire breed lost one of its latest but most enthusiastic adherents. His little herd at Elkhorn Farm, recruited originally from the Willowmoor herd, Highland Farm and Canadian sources, has during its relatively brief existence taken a leading position among Ayrshire herds on the Pacific Coast. Mr. Meyer was an enthusiastic showman but was no less interested in the ability of his cows to stand high on the rolls of the Advanced Registry. More than this, he was interested in a broad way in the development of Ayrshire interests on the coast where he felt that, as a breed, they had not yet come into their own. In the business conduct of his herd it was not so much the immediate profit that concerned him as the laying a foundation for the development of a wider interest and fuller appreciation of the breed in a comparatively new field. While the passing of such a man seems to be an irreparable loss, it is most satisfactory to know that the son, J. Hillegas Meyer, no less interested than his father, and sharing his ambitions to make the breed better known and appreciated throughout the West, will carry on in the development of Elkhorn Herd."

ANNUAL H-F MEETING

The sixth annual of the Holstein-Friesian Association of America will be held June 1, at Syracuse, New York. There will be election of officers and reports of the accomplishments of the past year.

16 FEMALES—16 BULLS

MOUNTAIN VIEW HERD OWNED BY HOWARD VAUGHN DIXON, CAL.

Thursday, May 26, at 1 P.M.

This is the first individual public sale from this well known herd since its removal from Iowa to California, and for this offering Mr. Vaughn has selected a class of cattle that he depends upon to make a favorable impression in his initial sale in California.

Scotch and Scotch Top Females and Bulls

In the sale list will be found a number of individuals representing the most popular tribes of Scotch breeding, as well as American sorts of approved breeding and substantial individuality.

The females include cows with calves at foot, and bred and open heifers, among them some of outstanding worth and the balance rated as most useful breeding material.

THE BULLS are especially attractive, including individuals that may well be given consideration as herd headers, with a splendid selection for the range man, big, well grown, rugged bulls raised under range conditions and ready for heavy service.

TUBERCULIN TESTED—GUARANTEED BREEDERS

TERMS OF SALE: One-half cash, balance in six months on approved notes at 8 per cent, but terms are cash unless credit arrangements are made before sale. Applications for credit may be made any time between now and opening of sale to the sale managers.

MOUNTAIN VIEW HERD is located on the main State Highway one and one-half miles north of Dixon, Calif. HEADQUARTERS OF SALE will be Travelers Hotel, Sacramento, from which point transportation to sale will be provided to those coming in by train morning of sale.

Building Better Herds

THE productive period of a dairy cow lasts only about eight years. That's why progressive dairymen raise calves from their high average cows for herd maintenance. They also know the difficulty of buying-in productive, trustworthy animals.

OLYMPIC Calf Meal with *Dried Buttermilk* is a real substitute for milk. It offers the greatest assurance for successful calf raising. OLYMPIC Calf Meal with *Dried Buttermilk* furnishes the right nutrition for every growth demand, in the form most easily digested and assimilated.

But best of all, OLYMPIC Calf Meal with *Dried Buttermilk* will prevent scours and digestive disorders. *Dried Buttermilk* supplies a wealth of lactic acid which disinfects the alimentary canal, sweetens the intestinal tract and assists digestion and assimilation.

Blended by successful raisers, OLYMPIC Calf Meal with *Dried Buttermilk* contains Oat and Barley Flour, Red Dog Flour, Corn Flour, Alfalfa Leaf Flour, Linseed Oil Meal, Dextrose and *Dried Buttermilk*. While really a milk substitute it can be fed with skim milk instead of water, or as a dry ration, mixed with a small amount of grain.

OLYMPIC Calf Meal with *Dried Buttermilk* is also successfully used to wean young pigs.

Essentials of Animal Breeding

By George M. Rommel, Chief Animal Husbandry Division

(This is a continuation of article appearing in Cultivator of April 23 and 30.)

IT IS clear to every one that in order to make the best out of the hereditary material represented in one's herd, and to use the laws of nature to the best advantage, one must have clearly in mind a standard which he sets for himself as the ideal toward which he must work. This standard must be definite and should be as practical and simple as possible. The exercise of selection, wisely and judiciously pursued, offers the breeder one of the two most effective means of bending to his own purposes the operations of chance, which otherwise nature will use to his confusion and undoing.

We have made the statement already that the hereditary material is passed down from generation to generation without change except so far as the operation of the laws of chance may have affected the process, beginning with the maturation of the germ cells. It is plain, however, that constant selection of a good type will increasingly intensify the properties of a given set of characteristics (in other words, of a definite type), but that this selection must be pursued constantly because the chromosomes which tend to produce the less desirable types continue to be present, although in decreasing numbers. If the force which has been selecting the desirable chromosomes is removed, then the undesirable ones may once more prevail. In other words, our modern breeds of farm animals are an improvement over the stock from which they sprang. There is, therefore, a constant pull backward and downward against which the breeder must work by wise selection and skillful matings. If this intelligent direction by human skill should be removed, our animal stock would rapidly degenerate to the level of the types of centuries ago.

Selection should be designed to correct faults in the parents, and, as a rule, the male is depended on to do it. A few concrete cases will illustrate. If the females have a tendency to be too leggy, select a male that is compact and close to the ground. If the backs are not ideal, select a male with an exceptionally strong back. If the sow's feet are not the best, get a boar that is unusually strong in his feet with strong, upright pasterns. We might multiply these illustrations indefinitely. Therefore, a sire should be a better individual than the females with which he is to be mated; otherwise the standard of the herd or flock may decline. To some extent a breeder may extend these principles to the grandparents, but for practical work on a farm that is producing market stock it is commonly unnecessary to go farther back than the sire to be selected. In other words, don't buy a poor male merely because some one tells you he has a good pedigree.

The breeding animals selected should look the part. Good bone; deep, broad chests; strong, broad backs; and fully developed bodies should be emphasized. Especial attention should be paid to the head, for that part of the body tells many a story which otherwise would be overlooked. Width between the eyes, full, prominent eyes of pleasing appearance, broad muzzles, and prominent nostrils indicate points of value both to the breeder and the feeder. In males, strong evidence of masculinity is important. The evidences of the masterful impressiveness of the masculine sex is often apparent in very young animals and may be taken to indicate a youngster that with proper feed and care will grow out into an impressive sire. In females we look for femininity, without indications, however, of weakness of constitution. Avoid cows, for example, with heads like those of steers. These points make up in total what breeders call "character" and are among the most important considerations which a breeder must bear in mind in building up his herd or flock.

Good feed, care, and attention are valuable adjuncts to selection. Unless feeding permits full development we can not select intelligently the animals which have received and can transmit the characters we desire to perpetuate. Starved animals which never have had an opportunity to demonstrate their capacity to produce meat, milk, wool, or other valuable commercial products, furnish poor material from which to select individuals capable of maximum and most economical production.

One must use these rules of selection with judgment and common sense. While faults undoubtedly can be corrected by the use of males of superior individuality, it may be unwise to use some females for breeding even market stock because they may be too inferior for even this purpose. To sell them and substitute better individuals, either high grades or pure breds, is often the more sensible course and the more profitable in the end.

Selection alone, however, is not certain to result in steady progress. Different combinations of hereditary elements may result in apparently the same characteristic. In practicing selection a man may introduce at any time the blood of a line which merely looks like that of his own stock, but which breeds differently. The result is the undoing of past progress, the next generation showing the variability characteristic of the second generation of a cross. Only by breeding within relatively narrow limits can one be reasonably sure that he is mating animals which both look alike and have the same heredity.

Inbreeding

Next in importance to selection as a means of improvement in breeding animals, the most effective process at the command of the breeder is the judicious mating of related animals. This process is known as inbreeding and various terms, such as line breeding, close breeding, and incestuous breeding, have been used to define varying degrees of intensity of the process.

Inbreeding is one of the most discussed subjects in the whole field of genetics. All sorts of bad results are attributed to it. Lack of vigor, no resistance to disease, decline in size and fecundity, and even sterility are the fate of inbred animals, in the minds of many people. These ideas have a certain basis of fact, and often extend to farmers, who sometimes refuse to buy males which have inbred pedigrees. Breeds and families which have been intensely inbred for several generations develop manifestations of constitutional weakness which, it seems, can be explained only on the grounds of their close relationship. Scientific data of exact and elaborate scope, worked out under controlled conditions, are not abundant on this point.

We have, on the other hand, the accepted fact that progress in animal breeding began only when breeders began to inbreed. The work of Bakewell, who experimented during the last half of the eighteenth century, which made the greatest impression was the methods he used, and the method that has been most far-reaching in its results was that he mated his animals with first regard to their individual suitability for the mating and with secondary importance placed on their relationship. Since the time of Blakewell every breeder who has made an impress of permanent importance on his breed has used inbreeding as his most useful working tool.

When we mate related animals we are bringing together animals with a more nearly uniform character in their hereditary material than when we mate those that are not related. We are, therefore, increasing the probability that the offspring will be like the parents. But there may be hidden in the hereditary material the factor of an undesirable character. In other words, we may not know all that we should know about the ancestors. Back somewhere, perhaps, was a bad one whose traits are being bred out by selection in each successive generation. If we mate two related ani-

carrying this defect, we greatly increase the chance of perpetuating it. Instead of having an even chance or better of keeping the defect under subjection by not inbreeding, we double the chance of its appearing when we do inbreed. It seems possible to inbreed some animals much more intensely than others, and certain strains of breeds in the same species exhibit similar traits. To cite specific instances, cattle which have a special susceptibility to tuberculosis, horses with a tendency to certain unsoundness, such as roaring or spavin, should not be inbred. The safe rule, therefore, is not to mate closely related animals which have the same defects, either themselves or in their immediate ancestors.

Inbreeding should be practiced only by the most skillful breeders, and by them only when they have definite knowledge of the ancestry. Judiciously used, inbreeding results in a rapid fixing of type and enables the breeder to obtain results much more rapidly than without its use. It is like any other high powered implement. Properly used, it is a wonderful adjunct to human efforts; in the hands of the ignorant and careless it is a source of danger.

The purchaser of inbred males, however, need have no fear of using them if they are creditable representatives of the breed. As a matter of fact, he should prefer inbred males to others, especially if they are not related to his females, because they are more nearly alike in their hereditary material, and for that reason more likely to reproduce themselves with uniformity. They are usually sold under a guarantee that they are breeders (or they should be so sold), and if they do not breed, any reputable breeder will replace them. It is a general rule that inbred animals, when mated to unrelated ones, even though the latter themselves are inbred, produce offspring larger and more vigorous than either parent. From every standpoint, therefore, an inbred sire should be desirable to use in a farmer's herd, provided the animal is a good individual. The farmer should make certain of this fact. Then he should ascertain that the strain itself is vigorous, and finally he should have a guarantee that the animal bought will prove to be a breeder. If these conditions are met, the farmer will find inbred males much more impressive and will have a much more rapid return in improving his stock than if he had used males which were not inbred.

Whether a breeder should or should not inbreed his stock is a matter which he must settle for himself. The successful use of inbreeding is one of the best tests of a breeder's skill, and no man should inbreed unless he is confident that he possesses the requisite skill to make such a step successful. Generally speaking, the inbreeding of market stock is unwise; but the use of inbred males on the females of such a stock may be of the highest value, provided the breeding establishment which produced the males has not been injured by inbreeding. Such a fact can be readily ascertained.

Inbreeding fixes characters which can be fixed, but one of its most valuable consequences is bringing clearly to light the relative merits of different strains in such characters as fecundity, resistance to disease, and the like, which are affected so much by factors other than heredity that they can not be fixed in individuals. In these cases progress is more likely to result from selection of strains than from the selection of individuals.

A real danger from inbreeding is not to be urged against the practice itself, but against the peculiar infatuation which breeders acquire for certain blood lines. Once let a given line of breeding demonstrate its excellence for the production of a certain valuable type, and every progressive breeder strives to acquire some of this valuable blood. The strain soon becomes "fashionable." From this stage to breeding for the pedigree rather than for the animal is an easy step which is taken much too often. The corrective for such methods is the show ring, with competent and fearless judges in authority.

Outcrossing

Quite the converse of inbreeding is the practice of outbreeding or outcrossing. Even in plants which are usually self-fertilized, nature has provided for an occasional outcross that materially increases the vigor, stamina and general well-being of the stock. In animals which have been intensely inbred, outcrossing has interesting and important results. Mating to stock which has not been inbred results in increases in size and vigor. A similar result also follows the mating of two strains, both of which have been inbred, but which are not closely related to each other.

Pure Breeding

Step by step we climb the ladder of the art of breeding until we finally reach the top in the breeding of pure breds, the most fascinating, the most inspiring and the most remunerative branch of animal breeding when successfully followed; the most difficult and the most disappointing when not successful. The successful breeder of this class of animal is far more than a business man or a farmer. He is an artist, and the artistic appeal is first in importance to him.

The basis of pure breeding in the United States, except in the case of poultry and pet stock, is pedigree registration. Animals must be not only pure bred, but they must be registered in the book of record established for the breed.

Standards in pure breeding are more exacting and more complicated than in breeding solely for the production of meat, wool, milk, or eggs, but they should be practical, because the proof of the practical value of a breeder's work is the demand which is sustained in the long run for his breeding animals. The surplus of the registered pure bred establishments goes to improve the native and unregistered grade herds and into pure bred herds of less merit. A high standard is therefore absolutely essential to maintain quality, average excellence, and the reputation of the herd. Practical ideals must have quite as much weight as purely commercial considerations in the determination of the standards.

(Continued next week.)

LIKE FEEDING COWS IN THE DARK

"When I bought my farm two years ago there was a herd of scrub cows on it," writes a Wisconsin farmer to a field agent of the dairy division, United States department of agriculture. "I joined the cow testing association and soon found that my scrub cows were a failure, so I disposed of them and bought some pure bred and grade Holstein cows. The cow testing association is a guide board on the way to better dairying and a big saving in feeds, as one can feed to so much better advantage where the production is known. Trying to feed without records of your cows is like feeding in the dark."

Burr Farm is having a number of repeat orders for bulls this spring. Last week Mr. Cocke of Hynes bought his second son of Sir Veeman Korndyke Pontiac out of a cow which made a record of 15,000 pounds of milk with three quarters. F. D. Hall of Palmdale, Sam Gunn and J. F. Grube of Huntington Beach took others.

Moneymakers For Dairymen

With an abundance of cheap feed on hand, the time is particularly favorable for the establishment of new herds of registered Holsteins. The great demand and consequent shortage of good grade Holstein cows has advanced the price to a point where many practical dairymen may well consider the purchase of registered purebreds, even though the initial investment may be larger per head.

In the public sale outlined below there will be a wonderful opportunity not only to secure splendidly bred registered Holstein cows, but to buy the sort that are just right to start paying for themselves right away, for the offering contains an unusual number of fresh cows and heavy springers. In addition to this especial attention is here directed to the fact that the owner is prepared to extend more liberal terms than found in the usual sale, and such arrangements should be made with him well in advance of sale day.

177--Registered Holsteins--177

167 Cows 10 Bulls

Willowmead Herd Owned by James McGillivray Sacramento, Cal.

Wednesday and Thursday, May 18-19, 1921

WILLOWMEAD HERD now contains over 500 registered Holsteins of which number approximately 475 are females. This sale will positively include every cow in the herd that is in salable condition, and every one of the 167 females to be sold is either milking or a heavy springer.

Consider also that in addition to the fact that the females in this herd represent some of the very greatest producing families of the breed, a very large percentage of them are bred to one or the other of the two Willowmead herd sires, both of which are backed by world's record production. These are the two bulls to which more than half of the females are bred:

COLONY ZARILDA NEWMAN, sired by Aaggie Cornucopia Newman, son of the former world's record milk producer, Margie Newman, and out of the famous Canadian cow Zarilda Clothilde 3d De Kol, 33,153.6 lbs. milk and 1,194.18 lbs. butter in one year, and at a previous freshening she made a strictly official record of 1,070.23 lbs. butter from 30,427 lbs. milk.

PRINCE ECHO SYLVIA SEGIS, sired by Champion Echo Sylvia Pontiac, son of May Echo Sylvia, the only cow that ever made over 1,000 lbs. milk in 7 days. His dam is a 29.89 lb. 4 year old daughter of King Pieter, second dam a 31.70 lb. daughter of King Segis. He is a beautiful individual, and his service adds value to every cow in calf to him.

Among the Females in the Offering Are:

85 FRESH COWS, splendidly bred and producing heavily right now.

93 TWO, THREE, AND FOUR YEAR OLD HEIFERS, out of the best foundation cows in the herd and sired by bulls of splendid breeding.

28 DAUGHTERS OF DUTCHLAND SIR KORNDYKE COLANTHA, a proven grandson of Colantha Johanna Lad.

18 DAUGHTERS OF KING PONTIAC RUBY BURKE, a proven son of King of the Pontiacs.

17 DAUGHTERS OF PRINCE BUTTER BOY WALKER, a proven yearly record son of Prince Gelsche Walker.

14 DAUGHTERS OF KORNDYKE COLANTHA PARTHENEA, son of Dutchland Sir Korndyke Colantha and the great foundation cow Minnewawa Louise.

10 DAUGHTERS OF KING MEAD OF RIVERSIDE, the famous sire of yearly record producers.

COWS AND HEIFERS with records up to over 32 lbs. butter in 7 days.

DAUGHTERS of cows with up to over 32 lbs. butter in 7 days and up to over 1,000 lbs. butter in one year.

THIS OFFERING CONTAINS THE LARGEST NUMBER OF REGISTERED HOLSTEIN FEMALES OF MILKING AGE THAT HAS EVER APPEARED IN A WESTERN SALE. IT IS A WONDERFUL OPPORTUNITY TO PURCHASE FEMALES THAT START TO PAY FOR THEMSELVES THE DAY YOU GET THEM HOME.

The owner is prepared to extend liberal terms to responsible parties. Applications for credit may now be made either in person or by letter to JAMES McGILLIVRAY, R. 1, Sacramento, California.

Every animal positively guaranteed to be a breeder. No tuberculin test certificates.

June 9, Burr Farm and Agee Bros., Burr Farm, Los Angeles.

Shorthorns

May 25, Caledonia Farms, West Sacramento.
May 26, Howard Vaughn, Dixon.

Herefords

May 27, Finnell Stock Farms, Galt.

George W. Brown of the Burr Farm always has been an exponent of the long time test for dairy cattle, as his training has been largely in the production and sale of milk, and at sales when a good individual with a nice ten months or yearly record comes he is right on the job. It is the intention to give every cow in the Burr Farm herd a semi-official record and 40 are on test there now.

An extraordinary showing is being made by the first two year old daughters of King Segis Alcartra Abbekerk to finish their yearly work. This is the senior herd sire in the Bridgford Holstein Co. herd at Patterson, where all of these records have been made: Karlray Ormsby Alcartra, a junior two year old, after making the world's record for milk and butter for age in 305 days, finished the year with 915.77 pounds butter from 22,950.1 pounds milk. She is now owned by R. Stevens, Stockton, who purchased her in the 1921 Guaranty Sale. Mercedes Hengerveld Abbekerk, as a junior two year old, made 908.27 pounds butter from 18,160.2 pounds milk in one year; Miss Korndyke Mercedes Abbekerk, a junior two year old, made 758.27 pounds butter from 18,900.8 pounds milk in one year; Modesto Korndyke Abbekerk, a junior two year old, made 772.12 pounds butter from 16,215.4 pounds milk in one year; and Susie Segis Alcartra Abbekerk, a senior two year old, made 781.2 pounds butter from 15,921.3 pounds milk in one year. These five records establish the remarkable average of 827.13 pounds butter and 18,415.6 pounds milk, an average that has been equalled by the first daughters of very few bulls of the breed. The high producing daughters of the Bridgford junior herd sire, the famous three times grand champion King Segis Alcartra Prilly, are mostly out of daughters of King Segis Alcartra Abbekerk, and it appears certain that this herd has secured an exceedingly promising nick in the blood of these two bulls. The latest daughter of the Abbekerk bull to make a seven day record is Alcartra Sadie Vale Abbekerk, purchased by A. W. Morris & Sons, Woodland, in the December sale at Sacramento. She has recently made 20.15 pounds butter in seven days, adding one to the excellent list of two year old daughters of her sire with above 20 pounds in seven days.

A San Luis Obispo County Aberdeen-Angus

Proud Eric of Aberlour, winner of the first Highland and Agricultural Society prize in the exhibition of Aberdeen-Angus cattle at Aberdeen, Scotland, in August, 1920. Proud Eric's home is now on the ranch of F. F. Peabody, San Luis Obispo County. He weighs 1,850 pounds and is three years old.

Robert N. Clapp, owner of Sycamore Acres, Nuevo, has a foundation herd of which much may be expected, carrying a wonderfully rich percentage of the great King Segis blood, mainly through daughters and granddaughters of King Segis Pontiac and Johanna McKinley Segis. It will be remembered that Mr. Clapp secured the great cow Gerben Abbekerk Maid in the Stalder sale last fall. She recently dropped her tenth calf, a fine bull by Sir Skylark Ormsby Rauwerd, the 34 pound son of Sir Ormsby Skylark, now heading the Sierra Vista Ranch herd at Perris, and at freshening she was not yet ten years old. When the writer saw the grand old matron late in April she had apparently not reached her full flow of milk but was then up to over 100 pounds per day, and is in splendid physical condition.

Gotshall & Magruder, Ripon, recently acquired the C. A. Miller ranch at the same place, one of the good properties of that locality. They have had this ranch under lease for some time, carrying a part of their big herd of registered Holsteins on it. This ranch has one of the finest pastures in California, an asset that will figure largely in the growing out of the young cattle.

The strong position of the registered dairy cattle industry in California is apparent in the spring sales to date. The seven sales of registered Holsteins conducted by California Breeders Sales and Pedigree Co. during the first four months of the year contained 495 head which averaged within a few

DISPERSAL SALE

98 REGISTERED HEREFORDS

62 FEMALES—36 BULLS

Finnell Stock Farm Co., Galt, Sacramento County Cal.

Friday, May 27, at 10 A.M.

When Finnell Stock Farm Company purchased the entire herd of 180 registered Herefords from Kiesel Land & Cattle Co. early in 1920, the plan was to develop a large herd of high quality, but the owners have recently decided to make extensive planting of vineyards and orchards, making the sale of the cattle necessary.
Shortly after this herd was purchased, the owners prevailed upon Alex McDonald, the noted herdsman at University Farm, to visit the herd and select from the 180 head the females they should retain as breeding material in the number they wished to carry. This was done and afterward the tops of the remainder were sold at public auction in November, 1920. The offering in this sale thus represents the very tops of the entire original herd, and they are Herefords of unusual usefulness as breeding material.

29 COWS WITH CALVES AT FOOT

This group contains a most desirable lot of young cows, the calves at foot being sired by Beau Blanchard 37th, son of Engle's great Beau Blanchard, and by Sir Thomas, the numbers by each sire about equally divided.

33 BULLS FOR THE RANGE

These bulls are sired by Beau Blanchard 37th and Sir Thomas, out of some of the very best cows in the herd. Eight of them are 1920 calves, all except one past a year old, and the other 25 are of 1919 calving, practically all senior yearlings with a few 2 year olds. They have been raised on the range, which is true of the entire herd, and are ready to go right out into service.

33 BRED COWS AND BRED AND OPEN HEIFERS

This group presents a most attractive appearance for purchase, including young cows of real worth and a considerable number of heifers by Sir Thomas and Beau Blanchard 37th.

3 HERD BULLS

Beau Blanchard 37th and Sir Thomas have a large number of sons and daughters in the sale, which easily prove their worth as sires. The third herd bull to sell is without question one of the very best bred Hereford bulls ever sold in the west, the noted Gudgell & Simpson bred bull Cardinal, sired by the famous bull Domino and out of Capitola 34th, a daughter of Beau Modesto, second dam by Dandy Rex, third dam by Beau Brummel.

A STAR LOT The sale list includes a daughter of Cazier's Harris Standard 2nd, selling with a fine heifer calf at foot by Cazier's $10,000.00 Beau Blanchard 76th.

TERMS OF SALE: The owners are prepared to extend unusually liberal terms to responsible parties. Such arrangements must be made before sale, otherwise terms are cash. Applications for credit may now be made either in person or by letter to FINNELL STOCK FARM CO., Galt, Calif.

Every animal sold as a single lot, except range bulls, guaranteed breeders; everything over six months old tuberculin tested.

FINNELL STOCK FARM is about eight miles east of Galt, about 35 miles southeast of Sacramento.

SALE OPENS PROMPTLY AT 10 A.M.

Auctioneers:

C. L. Hughes, Sales Manager, 211 Ochsner Bldg., Sacramento, Calif.

dollars of $500 per head, and the total included an abnormal number of young heifers and a very large number of young bulls. With a grand averave of $455 per head on the 33 females and 18 bulls in the Hollow Hill Farm Guernsey dispersal, the strength of this breed is also apparent in California, for besides the large percentage of bulls in this sale it must also be considered that quite a number of the cows were from eight to 13 years old, and there were also a large number of hefer calves in proportion to the total number of females. All of the sales have been featured by large numbers of buyers, most of whom did not secure as many cattle as they wished to purchase.

In the census of registered Holstein cattle in California, recently completed by the Holstein-Friesian Association of America, Brattleboro, Vermont. Sacramento County leads the counties of the state with 1,154 head, Los Angeles County is second with 914 head, Fresno County is third with 844 head, while Stanislaus, Santa Clara and Tulare Counties follow in the order named with 742, 741 and 715 respectively. Tehama and Lake Counties are at the other end of the list, each being credited with a single registered Holstein.

Unusual interest is being manifested in the public sale of registered Holsteins from the Willowmead Herd, owned by James McGillivray, Sacramento, May 18-19, owing to the scarcity of Holstein cows and the fact that this sale contains the largest number of registered Holstein females of milking age that has ever appeared in a western sale. A total of 167 cows will be sold, after which Mr. McGillivray will still have approximately 300 head of registered females left, mostly heifers from two year olds down to calves. The herd is headed by two of the strongest bulls for milk producing blood in the West, Colony Zarilda Newman, being sired by a son of the former world's record milk cow Margie Newman, and out of the great Canadian cow Zarilda Clothilde 3d De Kol, that twice made over 30,000 pounds of milk in one year, her best record above 33,000 pounds, and the junior herd sire Prince Echo Sylvia Segis, by the best proven son of May Echo Sylvia, and out of a 29 pound four year old dam that combines closely the blood of King Pieter, King Hengerveld and King Segis.

The number of registered Hereford herds in California has increased rapidly during the past year, most of the foundations having been secured by new breeders in the various public sales. Another notable opportunity for purchase of foundation females will be presented in the dispersal of the Finnell Stock Farm Co. herd at Galt, Sacramento County, on Friday, May 27. It will be remembered that this company purchased the entire herd of 180 head owned by Kiesel Land and Cattle Co. in southern Oregon in the spring of 1920. After bringing the herd to California they secured the expert services of Alex McDonald, University Farm, to select from the entire herd the females to be kept for their breeding herd, and after this was done the tops of the remainder were sold at public auction in the fall of 1920, an offering that made a most favorable impression on all who saw it. The present dispersal includes the top animals picked by McDonald and can be regarded as a most substantial and useful group of breeding Herefords.

Superintendent Harriman in charge of the Los Angeles County farm writes: "I wish to report the sale to J. J. Rabai of La Mirada of the bull, Prince Gerben Abbekerk Mead, out of a young A. R. O. daughter of Beryl Luecke De Kol and sired by a 34 pound grandson of De Kol of Valley Mead 2d, former holder of the world's record for two successive years' butter production under full age. De Kol of Valley Mead 2d will also be remembered as the dam of Miss Valley Mead De Kol Walker, 36.8 pounds of butter in seven days and 1,113.57 pounds of butter in a year, at three years of age. This sale is of particular interest to us as Mr. Rebai bought another bull from this herd, August 3, 1917. This was King Clifton De Kol of Los Angeles County, the son of our former herd sire King Kines Homestead. Mr. Rebai is now milking about 55 cows, including 15 heifers sired by King Clifden which he says are the most persistent milkers he ever handled in 30 years' connection with the dairy business. This fact is directly responsible for the second purchase from the county farm."

Superintendent Neville of rodent control in Los Angeles County reports five squirrel crews treating 7,677 acres per month.

W. O. Ferris, a specialist in the growing of lettuce in the Salt River Valley of Arizona, has produced one head weighing 5½ pounds. Salt River Valley lettuce has attracted much attention for its exceptional qualities. The Fred Harvey Service used an average of 2,000 heads a day in the first four months of the year.

Extremely dry weather on the ranges in certain parts of Arizona has made the fire hazards greater. Sixteen fires have been reported so far this season. Ten of these were extinguished with very small damage and only one spread over an area as great as ten acres.

COMBINATION SALE
BURR FARM — AGEE BROS.

60—Registered Holsteins—60

Burr Farm, Los Angeles, Cal.

Thursday, June 9, 1921

This offering is made up largely of young cows, with a very large percentage of fresh cows in the list, and especial care has been exercised by both owners in selecting animals of good type and breeding, for it is planned to make this the first of regular public sale offerings from the great Burr Farm herd.

Many of the females are bred to one or the other of these splendid herd sires:

KING KORNDYKE PONTIAC 20TH, the famous $12,000.00 son of Miss Valley Mead De Kol Walker that sired the $41,000.00 bull King Korndyke Pontiac Acme.

SIR VEEMAN KORNDYKE PONTIAC, 30 pound proven son of Sir Veeman Hengerveld, whose daughters are making wonderful records both in short time and long time tests.

SIR MANUEL HENGERVELD, son of the 1,039.6 pound yearly record cow Iowana Witte.

BURR WALKER SADIE VALE, by a 31 pound son of King Korndyke Sadie Vale, out of a dam that made 618.04 lbs. butter in one year as a junior 2 year old.

KING PONTIAC TOLA ORMSBY, son of K. P. Tola, the noted 36 pound daughter of King of the Pontiacs.

The offering will also include a few choice bred heifers and a very limited number of young bulls.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

TERMS OF SALE: One-third cash, balance in twelve equal monthly payments, with approved note and live stock insurance to cover deferred payments. Arrangements for credit may now be made with the sale managers.

Auctioneers: Rhoades & Rhoades, Los Angeles

Management: California Breeders Sales and Pedigree Company
C. L. Hughes, Sales Manager, Sacramento, Cal.

Rhodes Grass

A Good Pasture that will Grow on Alkali Soil

RHODES GRASS SHOWING RUNNERS AND METHODS OF SPREADING

Gus Nellen of Imperial Valley has about 8½ acres in Rhodes on which he has kept 20 milk cows, also some hogs, and has about 12 tons hay left from the last year. His place was covered with Bermuda so he just broadcasted the Rhodes Grass Seed and turned the water in slowly and kept the place moist and before long the Rhodes had the Bermuda choked out. Another advantage is that he can keep the cattle on it while irrigating, for it isn't hurt by being trampled on, for wherever the runners are trampled into the ground, they start to grow.

He also recommends it highly for hog pasture as they like it very much, and do well on it.

LENDORRIS RANCH
Big Type Polands

We are offering a number of fine gilts by Lendorris Liberty Bond bred to Lendorris Liberator—a half-brother to the grand champion of this year's National Swine Show—for March litters.

W. L. Haag and Son, Hanford, Cal.

As Long
as Grass Grows and Water Runs
Shorthorn Cattle are Profitable

Do you realize that there is a shortage of beef stocks in the Western states ranging from 25% to 60%? That California has the highest grass beef market in the United States? That there is an abundance of feed in this state? That cattle must be utilized to consume our grass and hay. That no section can surpass this state in the production of high class breeding stock? That there is a constant trend toward the use of better blood on our ranges? That as long as grass grows and water runs cattle will be grown on our hills and in our valleys? That because of the above facts there never was a better time to start a small herd of registered Shorthorns than now, and that no better opportunity will be found than in the

50 SELECTED FEMALES AND BULLS 50

15 Scotch Cows The fifteen straight Scotch cows and heifers that have been listed were selected with the view of affording breeders a chance to add to their herds breeding material of the highest quality. There will be Acanthus, Orange Blossom, Rosa Hope, Campbell Ury, Roan Lady and other popular tribes. Such material carrying the services of the three great Caledonia herd bulls should be eagerly sought after by all breeders. Several of the cows sell with calves at foot.

25 Scotch Topped Cows The Scotch topped material represents a rare collection of big, thick fleshed, heavy milking cows that will return any man a handsome profit for their keep. Every one can boast of a most unusual list of sires in their pedigrees. No man can go wrong in purchasing such useful cattle. They too, carry the services of the three famous Caledonia herd bulls.

Imp. Caledonia Gainford Matchless
Pine Grove King

It is entirely conservative to state that no herd in America has three better bulls in service. Think what an opportunity this sale affords California breeders to add to their herd's bloodlines of the best. If you own Shorthorn cattle now, or expect to buy, you positively cannot afford to miss this event. Get to the top quick through the use of such blood.

10 Young Bulls The ten young bulls include six Scotch and four Scotch topped. They run in ages from 12 to 24 months. They are well grown, well bred and of good colors. Several are extra good prospects. Here is a chance to buy just the sort of bulls you need and at your own price. Remember the better the bull—the better the steers.

Terms: One-half cash, balance in six months on approved security. Arrangements must be made prior to sale with sale manager.

Every lot guaranteed a breeder.
All over six months old sell tuberculin tested.

Hollow-Hill Guernseys Sell Well

The increasing interest in Guernsey cattle in California was evidenced in the numerous inquiries for catalogs and the large crowd assembled to attend the dispersal of one of the good Guernsey herds of the state at Hollow-Hill Farm, Colton, on April 28.

The Hollow-Hill herd was established eight years ago and the foundation stock was among the best that could be obtained. During its existence it has been widely advertised through the wonderful quality of the milk it produced, through its show ring winnings and through the high records of production which have been made there.

The dispersal sale of these animals was the first real Guernsey sale ever held in the state. As in all dispersals there were a number of old cows which have done their duty by the breed, a lot of young calves which are not yet ready for business and 18 bulls. The strange feature was that the bulls were snapped up in short order and as many more could have been sold had they been available. The 18 bulls averaged $373 and a lot of them were not yet of service age. The lowest price was for a three weeks old calf who sold for $100. The older bulls did not bring their value but the yearlings sold well.

The 33 females averaged an even $500. The 20 cows averaged $515 and the 13 heifers $477. The top female and top of the sale was the great cow, Imp. Cherry III of the Effards with a four year old record of 15,567.6 pounds of milk and 735 pounds of butter fat in a year. She is also a show cow and has twice been grand champion of the Southern California Fair at Riverside. She was purchased by Mrs. Hulda Wessels for her ranch at Chino. Mrs. Wessels is the wife of a prominent doctor of San Diego and has purchased some very choice Guernseys in the past few months. D. O. Brant of Owensmouth was the runner-up on this cow but quit at $1,300 and allowed Mrs. Wessels to have her for $1,325.

The University of California was represented by Profs. Miller and Thomson who bid on all the good ones. They purchased the show cow Imp. Dene Jewel and the young bull Anger Langdon of Hollow-Hill Farm for use at the university farm. The professors were anxious to have the yearling heifers Jewel Langdon and Brittania E. King but their allowance could not beat the bid of Jas. Gannon of New York City who paid $1,000 and $900 respectively for the two.

San Diego County was represented by Walter H. Dupee who took seven animals, four of them heifer calves; Dr. J. A. Woodside who bought the state champion of the BB division, Rebecca of Sunnyview, and two others; B. F. Naylor, Dr. and Mrs. Wessels and Russell S. Cox of San Marcos, all purchasers. Imperial County was also there in force and a number of fine animals went to this rejuvenating dairy section.

The total for the 51 animals was $23,495. The sale was a fine tribute to the efficiency of Chas. L. Hughes and Col. Ben A. Rhoades of the California Sales and Pedigree Company, who handled it.

BULLS

1, Effie's King of Hollow-Hill Farm, Oct., 1916; Adamson Corporation, Los Angeles, $700.

4, Reuben Langdon 2d of Hollow-Hill Farm, Feb., 1921; James Harwick, Santa Barbara, $250.

18, Lady Langdon of H. H. F., May, 1917; Raitt Dairy Co., $325.

20, Topsy Langdon of H. H. F., Apr., 1919; W. E. Bush, Corona, $410.

21, Twilight of Glenfields Springs, May, 1914; Italian Vineyard Co., Guasti, $300.

22, Twilight Langdon of H. H. F., June, 1920; F. B. Naylor, San Diego, $385.

23, Primrose of Neshannock, Sept., 1914; F. B. Naylor, $450.

25, Rosa's Pride of Neshannock, Oct., 1915; James Marwick, $475.

27, Lady's Diamond of Elmcourt, June, 1913; A. A. Cook, Brawley, $415.

29, Imp. Nora of Mont Val, Apr., 1911; George De Vries, $410.

31, Patrician Nelly II, May, 1907, AA., 376.88 lbs.; J. A. Woodside, $450.

34, Lady Rilma, J. A. Woodside, $400.

35, Iva of Belmath II, Nov., 1912, A., 495.71 lbs.; Howard Farnsworth, El Centro, $495.

36, Tritoma's Lady Ida, Mar., 1919; J. A. Hamner, Riverside, $650.

37, Selma E. King of H. H. F., Sept., 1920; W. H. Dupee, $350.

38, Nina of Belmath, Sept., 1912, C., 361.91 lbs.; A. A. Cook, $295.

43, Lolita of Fairview, Apr., 1915; W. H. Dupee, $550.

46, Fan Langdon of H. H. F., Oct., 1920; W. H. Dupee, $360.

48, Azucena Langdon of H. H. F., Oct., 1920; W. H. Dupee, $310.

49, Della T. Langdon of H. H. F., Oct., 1920; Pauline E. Tench, Mentone, $245.

50, Nesha E. King of H. H. F., Feb., 1919; Anselm Grieve, Inglewood, $475.

51, Carolina Langdon of H. H. F., July, 1917, G., 473.37 lbs.; E. R. Burroughs, $650.

52, Brittannia E. King of H. H. F., Apr., 1920; James Gannon, $900.

53, Violet of Locust Hill, July, 1909, A., 594.16 lbs.; Italian Vineyard Co., $400.

Santa Anita Holstein Sale

The first individual public sale by Santa Anita Rancho, owned by Anita M. Baldwin, Santa Anita, on April 26, resulted in a fair average of prices, and attracted a crowd of over 500 that taxed the capacity of the well arranged temporary sale pavilion.

The offering was characterized by the two extremes of the herd as regards ages, the oldest animals and many of the youngest. In a number of notable instances the matter of age on high record cows was reflected in the prices, and as a consequence many unusual bargains fell to various purchasers.

The offering was absorbed by 28 separate buyers, all in Southern California, and the distribution of these good cattle should have a most favorable influence on future drafts at public sale from this excellent herd.

Superintendent Charles McDonald had only been on the ground about 24 hours after winding up his duties at Toyon Farm, but had the arrangements planned so that everything was ready when the opening hour for the sale came around.

The 26 cows and bred heifers averaged $482, the 17 heifer calves averaged $251, and the nine bulls averaged $223, making a general average of $362 for 52 head.

The sale was managed by C. L. Hughes, California Breeders Sales and Pedigree Co., Sacramento, with Col. Ben A. Rhoades, Los Angeles, on the block.

Following is list of individual sales:

FEMALES

PROTECT RANGE ANIMALS FROM POISONOUS PLANTS

Estimates made in many localities indicate that the average loss of range animals as a result of feeding on poisonous plants is as great as three to five per cent, while in some range states the percentage is much higher. In Colorado it is estimated the losses amount to $1,000,000 annually, while sheep raisers in Wyoming have placed their annual loss as high as 14.6 per cent of their flocks. Specialists of the United States department of agriculture point out that these losses, to a large extent, are of mature animals ready or nearly ready for market, and for the rearing of which large sums have been spent.

It is especially important for stockmen in range states to become familiar with poisonous plants, particularly in the spring when the stock crave green food and when in some cases poisonous plants offer the only green forage that is available. Department Bulletin 575 of the United States department of agriculture, Washington, D. C., tells how to identify many of the plants that have caused thousands of animals to sicken and die. This bulletin contains numerous colored pictures of the plants and is obtained from Superintendent of Documents, Government Printing Office, at 50 cents each. It also gives methods of treatment for animals poisoned through eating such plants. The bulletin aims to give help of such a nature that scientific knowledge will not be necessary in making use of the information contained.

MOLASSES
"I can well afford to feed it"
says Mr. A. L. McCulloch, of Alpaugh, Cal.

Mr. McCulloch is a far sighted feeder. He has noticed that Pure Cane Molasses has a tonic property and tones up the system of the stock. They are hungry all the time and clean up every stem in the mangers. A food that will have this effect, and can be fed as cheaply as Molasses can, is worth considering. It is not a question of how expensive—but how cheaply?

Find out about Pure Hawaiian Cane Molasses. All the information you need is in the booklet we have prepared for stockmen. Your copy is here waiting for your letter. Send for it today.

FARM LAND FOR SALE

FOR SALE
Seven Acres and a Bungalow. Hardwood Floors, Electric Range, Kewanee Water System

$16,500—Located 3 minutes' walk from the station in a high-class neighborhood, we have for sale 7 acres in bearing orchard, 4 acres Blenheim apricots, 10 to 12 years old, 2½ acres French prunes, 4 and 5 years old; has a fine modern bungalow of 5 rooms, modern plumbing, hardwood floors, open fireplace, electric lights, also an electric range; there is a domestic Kewanee water supply with high pressure storage tank; complete set of outbuildings, garage, room for help, stable and a new modern poultry plant with capacity for from 1,200 to 1,500 chickens, tools, incubators, farming implements, etc., go with the place.

$30,000—100-acre dairy ranch located near Mountain View. The place is all fenced and cross-fenced, and divided into several fields. There is a good modern dairy barn with stanchions for 60 cows, also milk house, garage, hay barn, and other outbuildings. There is a 7-room dwelling which is now vacant and ready for occupancy. Terms of payment can be arranged, and a purchaser can get immediate possession.

$20,000—17 acres of creek bank sediment soil, planted as follows: 9 acres in bearing peaches, 6 acres in bearing apricots, and 2 acres dry ground and building site. This is a remarkably good producing orchard — it paid net and clear of all expenses the last 3 years: in 1918, $2,099.01; in 1919, $3,153.33; in 1920, $3,351.83. The income for 1918 and 1919 represents the peach crop only, as the apricots were not in bearing until 1920. 400 fruit boxes, 500 drying trays, and 4,000 tree props go with the place. This property is owned by non-resident partners who have interests in other parts of the state that need their attention; hence this low price. Terms of payment can be arranged.

$25,000—20 acres, located near Mountain View, in a good neighborhood. 10 acres in bearing orchard and 10 acres in four-year old French prunes. Has a good residence of 7 rooms with the modern conveniences, good plumbing, electric lights, etc. Complete set of outbuildings, barn, garage, cottage for help; poultry, horses, farming implements and equipment go with the property. Can be bought on terms.

A HIGH-CLASS DAIRY PAYING NOW OVER $1,200 A MONTH

We have for sale a fully equipped modern dairy now stocked and running and producing over $1,200 a month from the sales of milk alone. Consists of 80 milch cows, 15 heifers and springers, 3 pure bred Holstein bulls and 6 calves. The dairy is on a 160 acre leased ranch. The lease has 5 years to run, and the ranch is equipped with a complete set of buildings, including a 7-room dwelling, cottage for help, modern dairy barn with milking machines, separators, etc. There are 40 acres in alfalfa. Complete set of farming implements, four work horses, two driving horses, etc., go with the place. Price $17,000. Rigid investigation invited. This property is offered for sale for the reason that it is owned by partners who wish to dissolve the partnership.

WILLIAM P. WRIGHT
Mountain View, Santa Clara County California

For Sale—110 acre foothill ranch in Mariposa County, 15 miles from county seat, 3 miles from store and postoffice and 1 mile from good school. This land is situated 1 mile from the main road to Yosemite Valley. Good road to place. 17 acres under cultivation, 4 of which is fine black loam suitable for garden truck, and can be irrigated from spring which runs the year round. Sixty acres more can be cultivated by some clearing. Balance fine grazing land with free range on forest reserve adjoining property. 100,000 feet good yellow pine saw timber, 5 living springs on place. An excellent place for a man who wants to go in the hog, cattle or sheep business. $1,650 cash or half cash down and balance on terms to suit. Jim Fulmer, Wawona, California.

FRUITS AND NUTS

(Continued from Page 647.)

than there was at the beginning of the century. The necessity therefore, of the daily food containing a generous proportion of fresh fruits is emphasized, if for no other reason than to prevent a one sided diet. This alone should class fruits as a food essential and not a luxury.

The high nutritive value of fruits is further emphasized by the very recent work of Osborne and Mendel on the vitamine content of fresh fruits, the summary of which studies is given herewith:

Water-Soluible Vitamine in Fruits

"The fresh juices of the edible parts of the orange, lemon and grapefruit contain water-soluble (B) vitamine. Their potency in this respect is quite similar to that of comparable volumes of cow's milk. The efficiency of these fruit juices is not lost by suitable modes of desiccation. A sample of grape juice tested was less potent than equal volumes of the fruit juices just mentioned.

"The edible portions of apples and pears furnish some water-soluble vitamine; the quantity of these fruits necessary to supply this dietary essential is relatively very large so that from a comparative standpoint they cannot be regarded as rich in this food factor. Prunes apparently are richer in the water-soluble vitamine.

"From preliminary experiments it seems doubtful whether the juices of the lemon or grapefruit contain more than traces, if any, of the fat-soluble vitamine. Our preliminary observations upon orange juice are indicative of some potency in this vitamine.

"The experiments with fruits place the dietary value of these foods, hitherto recommended because of their salt content, their laxative properties, or their anti-scorbutic potency, in a new light as sources of water-soluble vitamine."

The citrus fruits, especially the orange and lemon, have been administered as anti-scorbutics for about three centuries. The reason, however, for this property of the fruit was not known until the work of Funk, Osborne and Mendel and others disclosed the fact that the vitamines in these fruit juices were responsible for their therapeutic value. It may be of interest in passing to note that preserved lime juice, however, has practically no anti-scorbutic effect whatever and that fresh lime juice is relatively ineffective. It is the lemon which is so valuable as an anti-scorbutic and has at least four times the value of fresh lime juice as an anti-scorbutic. Oranges and lemons rank equally in this respect. Late investigations have also conclusively shown that the juice of citrus fruits may be dried quickly at low temperatures under reduced pressure, and the dried product be administered in a very effective way as a cure for scurvy, etc. The dried product retains its anti-scorbutic property for upwards of three months.

The practical bearing of the foregoing is that it should be possible to save a large amount of fruit juice hitherto wasted through the inability to profitably dispose of culls and other non-marketable citrus fruits.

Another addition to our knowledge of fruits and their composition is the work in 1917 of the bureau of chemistry, U. S. D. A., on the acid content of fruit. A summary of this study is given in the following statement:

Apple, malic only. Banana, probably malic only. Cantaloupe, malic, none—probably all citric. Cherry, malic only. Cranberry, citric probably predominates—malic also present. Currant, citric probably predominates — malic sometimes present. Gooseberry, malic and citric. Peach, probably malic only. Pear, malic only in some varieties; citric probably predominates in others with small amounts of malic. Persimmon, probably malic only. Plum, malic only. Pomegranate, probably all citric—no malic or tartaric. Quince, malic only—no citric. Raspberry (red), probably citric only—malic, if present, in traces only. Watermelon, malic, no citric.

It will be noticed from the above that malic acid is the predominating acid. The citrus fruits are not listed for the reason that it has long been recognized that citric acid is the acid of the orange, lemon, grapefruit, etc.

Nutritional studies on nuts carried on during the past three and a half years confirm the statements made in the opening paragraphs regarding the digestibility of nuts and, furthermore, greatly add to our knowledge of the value of this food. Three of these studies are specially worthy of mention: The investigations by Hoebler on problems in connection with collection and production of human milk. The investigations by Cajori on the nut protein and vitamine contents of nuts. The study by Holmes on the digestibility, by man, of protein supplied by soy bean and peanut press cake flours.

(Continued next week.)

The California Olive Association has awarded prizes for the best Olive Day window displays, $50 being given for the photograph of the best windows in Southern California and north of Tehachapi. The judges found considerable difficulty in picking the winner in the south owing to the close competition between the window of Hamilton's Grocery in San Diego and that of Albert Cohn, Los Angeles. The prize, however, was finally awarded to the latter. In the north, the window of Hochheimer and Company of Bakersfield easily carried away the honors.

Vocational education in Arizona is to be placed under the direction of state superintendent of public instruction, in line with the present tendency to economize in all matters of public interest wherever this may be accomplished without detrimental results.

OilPull Performance Proved by University of California

In 1913, the Kearney Vineyard, (The University of California Farm) of Kearney Park, Fresno County, California, bought a Rumely OilPull tractor. And for eight years this old OilPull has been in almost continuous operation on this 5,000 acre farm.

The OilPull has been called upon to do many different kinds of work, both on the belt and drawbar, on this highly diversified farm, producing 22 different commercial crops.

It works over irrigation checks causing exceptionally heavy strains. Any tractor must have sturdy construction to stand such extremely hard service continuously.

But the OilPull has the strength and endurance that gives an unequaled degree of dependability for many years of constant operation.

It has unparalleled economy in fuel, repairs and upkeep.

In December, 1919, this farm ordered another OilPull which has been in continuous operation ever since.

Ask the manager of Kearney Vineyard or the owner of any other of the many OilPulls in California whether, in the years they have used their OilPulls, they have ever had occasion to be other than proud of the tractor's performance.

Have the nearest Advance-Rumely dealer direct you to OilPull owners and give you additional data—or write us.

Prices Have Been Reduced
on International Hay Presses

The International Dealers will give you full particulars

BALED HAY is better hay. It has a higher food value. It is more economical to handle, haul, and feed. It occupies only one-fifth the space of loose hay, therefore can be stored and protected more economically. Each of these advantages represents added profits on your hay crop.

An International hay press, horse or power, will yield you full returns for your power and labor. And after you have multiplied the profits on your own hay crop, you can fill in the late summer and fall months profitably baling hay and straw for others. Some farmers say they have paid for their presses in thirty days, baling for their neighbors.

International horse hay presses are made in four sizes, with capacities of from six to fifteen tons a day; power presses in three sizes, with fifteen to thirty-ton capacities.

Write for catalog, and see your International dealer without fail.

In the Weaning Coop

By Jean A. Koethen

THE change from brooder to weaning coop or cold brooder is often a difficult and painful one for the chick if not for the caretaker. To make it easy has been the study of commercial poultry keepers, and nearly everyone has worked out a system for himself, not all alike, but all designed to accomplish results.

One of the best methods of weaning is that which begins in the brooder house. Many of the most up to date brooder houses are fitted with narrow roosts of lath or battens as well as with stoves. These roosts are built into rhomboidal frames, widening from bottom to top and fastened to the wall at a height of perhaps three feet from the floor. When a new hatch is placed in the house these roosting frames are fastened up to the wall out of the way. After a month they are let down so that the chicks may roost on them in the daytime while they still sleep on the floor. In a short time the little fellows begin to find their way onto the roosts at night, and by the end of the second month they are all roosting. On some ranches the pullets continue to roost in the brooder house till they are ready for the laying house, the marketing of the cockerels having left abundant room. On others, where it is necessary to make room for another hatch, both pullets and cockerels are transferred at two months of age to small coops holding from 25 to 50 birds apiece.

Range for Pullets

The sexes are separated at this time because they require different treatment. Cockerels should be penned in a small yard and fed a fattening ration till they weigh from 1½ to 2½ pounds, when they are sent to market. Pullets should have as much range as can be given them. One very successful breeder keeps the pullet coops in a walnut grove which is planted to alfalfa between the trees, allowing each 50 pullets a space the size of a city lot. Another has a small yard for each coop but plants each yard to grain early in the winter, so that the birds will have growing greens at the start.

Clean ground and green range are of tremendous importance to pullets as well as to little chicks. A writer in a current periodical calls the question of range "the poultryman's big problem." "It can be done," he says, "this thing of growing chicks upon limited areas—for men have done it and still do it—but undeniably the attempt to restrict the range of the growing chick is one of the principal causes, if not the most important, of failure that menace the poultryman." This seems like strong language, but from the reports that come in every spring of deaths of chicks from coccidiosis and other diseases due to overcrowding and contaminated ground I doubt if it is too strong.

When chicks are moved from brooder house to weaning coop without having had a chance to learn to roost, it is a good plan to have a clean wood floor or droppings board under the roosts. A little ingenuity and plenty of straw will make a comfortable nest for them till they are ready to roost, and an old quilt or blanket or burlap sack laid on the roosts to simulate a hover helps to break the shock of sudden change and chill. Chicks are stupid creatures and have to be given time to learn any new thing. Their minds run in a single groove and cannot be sidetracked with a jerk. When only a few chicks are to be handled, an ordinary lug box covered with a burlap sack and placed under the roosts at first serves as temporary brooder and makes transition easy.

The coops used for weaning are usually from three to four feet square, with open fronts. Sometimes the roosts are placed so far from the ground that there is room for scratching under the droppings board. This plan furnishes protection from sun and rain as well as sleeping quarters.

More Economical Handling of Eggs

Poultry Producers of Southern California find it is necessary to extend their quarters in order to handle their increasing business. The first step is a campaign for new members, which is on at this time. In his appeal for new members Cornele G. Ross writes: "We, as an organization of cooperative producers, are rendering a service to the poultry industry of this section, without which the industry as a whole would face a serious setback, and we feel that there should be some way to bring outsiders who are profiting by our efforts to realize their obligations and accord us their support. Nonmembers who boast that they can obtain one or two cents per dozen more for their eggs than we can pay to our members know that this is entirely due to our ability to market the surplus, and such of them as are fair minded should be willing to share with us in this work. We believe many of them would do so if our present membership do their full duty as missionaries to put the facts before these nonmembers in such a manner as would result in securing their support."

As to the new quarters:

"Our manager estimates that a material saving in operating costs would be possible with adequate and proper handling facilities, while with a suitably designed building we might be able to still further cut our costs by the use of daylight instead of electricity for lighting, to say nothing of the better results which could be secured in that manner. With plans and estimates before us, our next move would be to find a way in which we could finance such a proposition, and it is possible that a stockholders meeting to discuss ways and means, and, if thought best, authorize going ahead with it, would be desirable. Many other organizations of producers in Southern California are now erecting buildings of their own, and we should not lag too far behind in a movement which makes possible better service to the membership and a consequent ultimate saving to the consumer."

STORRS EGG LAYING CONTEST

Storrs, Connecticut, May 2, 1921. Report for week ending May 1:

The hens at Storrs are celebrating the tenth anniversary of the establishment of laying competitions in America. The average of previous years at the end of April has been approximately 68,000 eggs, but in the tenth contest, now running, the 1,000 hens have laid over 74,000 eggs. This means, then, that these hens have laid over 8,000 eggs more than the man-

gement of the contest expected, all f which is of course very gratifying o the owners who have sent their irds to Storrs for the ostensible pur-ose of making high records. In gen-ral, a mixed poultry population in a aying contest will produce in the first ix months 43 per cent of the number f eggs they will lay for the entire ear. On this basis it is predicted hat the hens now at Storrs will lay, y the end of next October, more than 72,000 eggs.

With this high average yield it nat-rally follows that the race is fast and urious. In the closing week of the irst half year a pen of Buff Wyan-lottes owned by Hollis P. Cloyes, Sil-er Lane, Connectict, tied for first lace with two pens of White Leg-iorns entered by Mrs. J. L. Theusen f New Haven, Connecticut, and Em-ry H. Bartlett, Enfield, Massachu-etts. The score was 61 eggs each.

The four leading pens in each of the rincipal varieties are as follows:

Barred Plymouth Rocks

W. H. B. Kent, 1,011; Rock Rose Farm, 914; Ernest W. Picker, 842; Jules F. Francais, 796.

Rhode Island Reds

Charles H. Lane, 1,085; H. S. Bick-ford, 1,000; F. S. Chapin, 992; Henry P. Walker, 939.

White Leghorns

James O. Le Fevre, 991; L. E. In-goldsby, 974; Hollywood Farm, 954; Ernest H. Scott (White Leghorns), 939.

Other Varieties

Obed G. Knight (White Wyan-lottes), 1,109; H. P. Cloyes (Buff Wy-andottes), 932; A. E. Hampton (Black Leghorns), 763; Harry D. Emmons (White Wyandottes), 686.

Poultry Queries

Conducted by Jean A. Koethen

Cholera

My chickens sat on the ground with heads bent almost under their crops and at intervals of 25 or 30 minutes seemed to have severe spasms or con-vulsions. They lingered this way for about two days, then died. Their drop-pings were white and watery and their heads became black. What had they eaten?—Subscriber, Palo Cedro.

The symptoms are those of cholera rather than of ptomaine or mineral poisoning. In cholera the bowel dis-charge is generally bright yellow or greenish yellow, but sometimes it is white. The convulsions, I take it, in-cluded a stretching or twisting of the neck. which is also characteristic of cholera. Last summer at Van Nuys Professor Dougherty reported similar cases which a bacterial examination proved to be cholera, and stated that a thorough cleaning up of the prem-ises seemed to be the most effective cure. It might be well for you to write Dr. Beach, Poultry Department, Agricultural Experiment Station, Davis, California, describing the symp-toms in detail.

BETTER PACKING NEEDED

Vice-President Robert E. M. Cowie of the American Railway Express Com-pany, New York, talks on egg break-age in transit:

Eggs are perhaps the most fragile articles of food which travel by ex-press. In shipping eggs, the Chinese are really ahead of us in providing safe methods for getting them to mar-ket. Their cases are made of heavier wood and while it is true they use the honeycomb filler, it is of superior material, doubled, each partition con-sisting of two strips, and, most im-portant of all, each egg is held in a bed of soft rice hulls, which prevents it from touching the filler at the top, bottom or sides. This supports our contention that the fragile, oval shaped egg should not be shipped in a square container, but in one the shape of the egg itself.

There are other contributory causes in the preparation of eggs for ship-ment that make it almost impossible under the circumstances to move an egg case without substantial breakage. A frequent one is the use of news-papers in place of cushions with honey-comb fillers. In our opinion, based on actual experience, newspapers of-fer no protection at all. For cush-ioning material we urge the use of excelsior pads at both the bottom and top of the crate and between the first and second layers. This serves to break any shocks incurred from ordi-nary handling and thus gives addi-tional protection to the eggs. About 90 per cent of egg breakage occurs in the top layer.

There are many points regarding good packing which are good busi-ness principles for the producer. For instance, eggs should be packed in fillers with the little end down. The reason for this is that the air cell is at the big end and the eggs look much better and naturally bring better prices. Likewise, the small eggs should be packed together and the large ones by themselves. All of these practices not only make the eggs more marketable, but add to the security of the shipment and reduce the pos-sibilities of egg breakage.

New A-1 cases, carefully strength-ened with large headed, cement coat-ed, four penny wire nails, with cup fillers, or if new honeycomb fillers are used, six excelsior cushions, is the cheapest insurance the egg shipper can buy.

RAISE LOAN LIMIT

Congressman Horace M. Towner of Iowa, chairman on the committee of insular affairs, introduced a bill (H. R. 4131) last week which will increase the amount that the federal farm loan banks may lend to individuals from $10,000 to $25,000. The American Farm Bureau Federation has been in favor of this change for some time and expressed itself again regarding it at the recent Washington meeting of the executive committe and state delegates.

Carl S. Vrooman, director of the American Farm Bureau Federation gift corn project, has issued the fol-lowing statement of thanks to the various agencies that contributed to the success of the enterprise: "Four hundred thirty-one cars of the farmers' gift corn now rolling across the conti-nent in 11 solid trainloads will, during the next few months, save the lives of at least 100,000 of the famished peo-ples of Europe. This large consign-ment could have been multiplied ten-fold if the farmers' generous offer had been accepted and acted upon."

Boys studying vocational agriculture in the Pleasant Valley district of Gila County, Arizona, have had shipped in some pure bred swine. This is said to be the first importation of pure bred swine into this particular district.

The state land settlement at Delhi, Merced County, now has 820 acres under irrigation from electric pumping plants.

Men who KNOW your truck engine

Your truck engine was designed to stand up and give full service. It's an investment that must show returns.

To give full service your truck engine must be correctly lubricated.

Our Board of Lubrication Engineers recommends the correct grade of Zerolene for the lubrication of your truck engine. These lubrication experts *know* your truck engine, know what it should do to give you a fair return on your investment.

Follow their recommendations as given in the Zerolene Correct Lubrication Chart. Ask for one. Use Zerolene for Correct Lubrication.

Sheep: Ewes, 4.00@5.00; lambs, 8.00@10.00.

HIDES AND PELTS

Quotations furnished by California Hide Corporation for stock delivered to their warehouse at 1960 Santa Fe Avenue. Receipts from the interior for 24 hours ended at 10 a. m. Tuesday were: 237 hides, 114 pelts.

Green and green salted hides: No. 1 heavy hides, 50 lbs. and up, 4 per lb.; No. 1 light hides, 25 to 50 lbs., 4 per lb.; No. 1 kips, 15 to 25 lbs. 6 per lb.; No. 1 calfskins, under 15 lbs., 10½ per lb.; No. 1 slunks, 20@40 each; No. 1 bull hides, 3½ per lb.; No. 1 horse hides, over 50 lbs., 1.75 each; No. 1 horse hides, 40 to 50 lbs., 1.25 each; No. 1 horse hides, 30 to 40 lbs., 75 each; ponies, 30 each; No. 1 grubby hides and skins, 1½ less; No. 2 hides and skins, 2 less; glue hides and skins, 1 per lb.

Dry flint hides—No. 1 hides, 16 lbs. and up, 9 per lb.; No. 1 kips, 6 to 16 lbs., 10 per lb.; No. 1 calf skins, under 6 lbs., 11 per lb.; No. 2 hides and skins, 6 lbs., 10 per lb.; No. 2 hides and skins, 2 less; glue hides and skins, 2 per lb.

Pelts: Large, long wool, 40@70 each; medium, 20@40 each; short wool and shearlings, 10@20.

shearlings, 10@20. Lambs, 10@30 each; badly damaged and very small lambs, worthless.

Goat skins: No. 1 common, 10@30 each; No. 2, 5@10 each; badly damaged and small kids, worthless.

Tallow: No. 1, white and hard, 4½ per lb.; No. 2, 3 per lb.; No. 3, dark and greasy, 1@3 per lb.

Wool: According to quality and condition, 5 per lb. and up.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock May 10, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Supplies liberal, market firm. Idahos: Russets mostly 2.25@2.50, Rurals 1.90 @ 2.00. Oregons: Burbanks, 2.25@2.35; few 2.50. New potatoes: Supplies liberal, market steady, best 1.75@2.00, small 75@1.00 per lug. Sweet potatoes: Supplies liberal, market firm. Mostly 2.25@2.50 per lug. Oklahomas: 7@8½ per lb.; jobbing sales 7½ per lb.

Onions: Supplies heavy, market dull. Stocktons: White Globes and Browns, cold storage stock best 1.00, poorer 60@75 per cwt. Local: Per bunch green mostly 12½. Imperial Valley: Bushel crate, Yellows, 1.25@1.35.

Wax, 1.40@1.50.

Garlic: Supplies liberal, market dull. Wide range in quality and condition. Best mostly 10@13, poorer 7@9 per lb. New 12@15 lb.; few higher.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock May 10, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Supplies heavy, market weak, 50@75; few fancy 1.00 doz.

Asparagus: Market steady, supplies

Asparagus: Market firm; supplies liberal. Local: Mostly 12@15 per lb. Northern, 11@14 per lb.

Beans: Supplies liberal. Per lb., Green Kentucky Wonders, 11@14 per lb., green pods 10@12 per lb., Wax 10@13 per lb.

Beets: Doz., 30@40.

Cabbage: Field crate best mostly 2.25@2.75; poorer 1.50@2.00.

Carrots: Doz., 35@40.

Cucumbers: Local best, 2.75@3.00 doz.; Hothouse, mostly 1.50@2.00.

Lettuce: Local field crate quality poor, 90@1.10; best, 1.50@1.75.

Peas: Local: best 7½@8½; poorer low as 6 per lb.

Radishes: 25@30 doz.

Rhubarb: Local strawberry 1.10@1.25 bx.; jobbing 1.00@1.15; Crimson Winter, 80@90.

Spinach: Mostly 25@30 doz.

Squash: Summer, best, 1.25@1.40; jobbing, 1.10@1.25; per flat 1.00@1.25.

Tomatoes: Supplies heavy, market dull. Mexicans: per lug, repacked, best 2.25@3.00, poorer low as 1.50@1.75. Imperial Valley: per crate, best 1.25@1.50, small 50@1.00; jobbing Mexicans, repacked, 1.75@2.25, original 1.00@1.50, Imperial Valley best, 1.10@1.35.

Turnips: Doz., 45@50.

FRESH FRUITS

Cherries: Supplies light, best, 25@28 lb.

Strawberries: Supplies moderate, market weaker. Per crate, 30 pints, best 3.50@4.00; poorer 2.00@3.00.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm on good stock. Local: per box, market pack 2.00@2.50, special packed brands 2.75@3.00.

Lemons: Supplies heavy, market dull, wide range in prices. Local: packed box 1.50@2.25, few high as 2.75, loose 75@1.00 per box, per lug mostly 40@50.

Oranges: Supplies firm, market firm. Navels, market pack, large sizes 3.00@3.50, small low as 1.75, special brands, large sizes 4.00@4.75, small sizes 3.00@3.50. Valencias, best brands, all sizes 3.75@4.00, packing house culls 50@75, few best 1.00@1.75 per box.

HONEY

Supplies of White Sage and White Orange Blossom extremely light. Supplies of other varieties heavy. Very limited wire inquiry. Very slow movement, market dull. Carloads f. o. b. usual terms: per lb. nominal quotations, very few sales White Orange Blossom 11@12; White Sage 12; Light Amber Alfalfa 6@7; Light Amber Sage 8½ White Alfalfa 8@8½. Hawaiian White 7; Light Amber 6; Honey Dew 4½. Account unfavorable weather condition, prospect for orange and sage crops are poor. Too early to obtain indications of crop prospects for other varieties.

GRAIN AND FEEDS

Grain Exch. price bid May 10:

Corn: Bulk, No. 1, Yellow 1.70; No. 2, Yellow, 1.62½.

Bran: Kansas, 30@50.

Kaffir: Eastern, 1.57½@1.67½.

Milo: No. 2, Eastern bulk 1.78¾.

Barley: Carlots 1.36¾.

Kafir: Eastern, 1.50@1.55.

HAY AND FEED

Alfalfa Growers of California report under date of May 9:

No. 1 Dairy.....16.00
Standard Dairy 14.00

Under date of May 7, A. W. Scott Co. says:

Receipts past week 931 tons, as compared with last week's arrivals of 749 tons. The San Francisco market situation is without any new feature and prices are being maintained with considerable difficulty. The demand is extremely light and if the receipts had been any heavier probably prices would have declined. A large proportion of the hay coming in has been off grade and difficult to move. The better qualities of hay sell fairly well but anything that is below standard can only be marketed by some concession in price or by some extra effort. The labor interference with shipping has greatly affected export trade while impending labor troubles in the building line have caused a hesitation and uncertainty that has reacted against the hay consumption locally. Reports of the new crop are of abundance in almost every locality. Apparently the low price of barley will cause a great acreage to be cut for hay. The general report of quality seems to be that we will have an unusually abundant crop with volunteer and alfalfa predominating. Alfalfa is extremely depressed. First cutting is being cut up in many localities and consumers are only buying from hand to mouth now, waiting lower prices on new crop hay.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Citrus Markets

Los Angeles, May 11, 1921.

Navels are being rushed to the market and a cleanup will be effected within a few days. The market at the present moment is exceptionally good. F. o. b. prices are ranging between $3 and $4, with auction prices frequently showing close up to the $6 mark. Valencias are going freely and being well received, in fact, Valencias are commanding slightly higher averages than the Navels.

Lemons, on the other hand, are unchanged, and are given entirely unsatisfactory reception. Fruit on docks and in transit aprpoximately 50,000 boxes.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 20,986 cars; lemons, 4.409; total, 25,395. To same date last season: Oranges, 17,132; lemons, 3,385; total, 20,517. From Central California to date this season: Oranges, 5,340; lemons, 135; total, 5,475. To same date last season: Oranges, 4,858; lemons, 287; total, 5,145. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

LEGAL QUERIES

(Continued from Page 651.)

It would depend undoubtedly upon certain things which are not mentioned. First, the terms of the respective reservations across the roadway must hold. Unless there was a dedication to the general public by reason of a recorded deed, the right of way would be presumed to be merely a private right of way, and by the agreements between the subsequent grantees this right of way would be discharged. Clearly a party who is not concerned in such grant could acquire no rights thereby unless it might be that he was also a grantee of the original owner of the property and that his land was so situated that such right of way was necessary for his use and that he purchased his property in reliance upon the continuance of such right of way. In such event, he might be entitled to have the road maintained.

Garbage Collection

There is a city garbage ordinance appointing a garbage collector and entitling him to receive a fee for each month for the collection of garbage from residences. I paid the garbage collector for three months in advance. Before the expiration of the time he was released from his position and another collector appointed. The successor insists that I pay him and that I get my money from the first party. I hold the official receipt. What are my rights?—Subscriber.

In order to accurately give an opinion on this matter it would be necessary to see the ordinance itself, but it would seem that if the garbage collector was appointed by the city and you hold receipt of the city, then your contract is not with the individual who may be filling the position, but with the city itself, and having paid fees required you can require the city or its proper collectors to perform the duties for which the fees were paid.

Water from Private Company

A private water company furnishes water at a monthly rate. The pressure is persistently so low that the water will not run into the house pipes. I have refused to pay my monthly water rate for some time on account of poor and inadequate service. Could I enjoin the water company from shutting off my water on the ground that they have failed to live up to their contract?—Subscriber.

It would seem from the legal proposition that when a party makes a contract to furnish water in a certain manner, at a certain pressure, and fails to comply with said contract that he is no more entitled to receive pay based upon complete performance than is any other party. It has been many times held that where the service of water under pressure by a water company was so inadequate that it was impossible to put out fires that they were liable for any damage caused. Of course, if they are not serving the water it would seem rather ridiculous to enjoin them from refusing to do that which they do not do anyway The question of public utilities such as this cannot be segregated from the authority of the railroad commission. While you may be perfectly right in refusing to pay your bill, it would seem that your proper procedure would be to file complaint with the railroad commission rather than to atempt proceeding by way of injunction in the courts.

The Florence diversion dam which will furnish water to the Pima Indian reservation in Arizona and for about 27,000 acres owned by white settlers, will be completed about July 1.

REDUCTION IN PRICE OF GAS

We have communication from a power farming bureau in Chicago calling attention to a radical reduction in kerosene and gasoline. Manager Fuller writes:

"The immediate effect of these new low prices will be to stimulate power farming. We cannot give too much publicity to these radical reductions in fuel costs, affecting, as they do, every owner of an automobile, truck, tractor, gas engine, or other farm power machine. Please use your good offices to see that this news goes out to every farm home you reach."

We Californians fail to see where this concerns us. There has been no noise anything like falling prices. California is still paying its top-notch prices.

The reduction in the East amounts to from 4 to 10.6 cents. For instance, Kansas City gasoline on March 1, 1920, was 23.2 cents; May 25, 26.2, and August 26, 26.5, after which it began to decline and it is now down to 18.7. At Des Moines prices ranged like this: 24, 26, 26, 27.1, 28.5, and now down to 21.6. In Indianapolis the high point was 28.3 and is now down to 21.6. Wichita's range was from 27.1 down to 16.5.

MINIATURE GRAIN ELEVATOR

That bulk handling of grain is by far the most economical method is the contention of Andrew Kaiser, a large ranch operator at Artois. Mr. Kaiser recently said:

"My elevator at Artois paid for itself the first year in the saving of the sack bill. I believe I have spent enough money for sacks, warehouse charges and handling to have paid for a dozen elevators. We cut the grain, thresh it and haul it direct to the elevator. At night the grain is safely stored. When I think of the time I had 16,000 sacks in the field at the mercy of the weather, I do not want to quit bulk handling."

Since it is now possible for ranchers to build and own their own miniature elevators and loading stations, the handling of grain in bulk will unquestionably increase.

A BEAVER DAM FABLE

"Beaver," said the Blue Jay, "the Muskrats have decided that the last Dam you built was a mighty poor one."

"Don't bother me," puffed the Beaver, "I'm building Another!"

"Beaver," said the Blue Jay, "the Muskrats have approved your New Dam as Quite Creditable."

"What's the Difference?" said the Beaver. "I'm building Another One."

"Beaver," said the Blue Jay, "the Muskrats wish to discuss your Theories of Dam Building. When will you talk with them?"

"When I am through Building Dams," said the Beaver.

Moral: Talk is of Prime Importance only to Those Whose Work is Not.—Life.

YOUNG VINES DYING

The Associated Grower reports from various sections where extensive planting has been carried on this season an unusual percentage of loss of young vines. Part of the loss is from the usual causes, such as careless handling, and a certain percentage of them are believed by certain observers to have died from the warm dip employed against phylloxera. Just how severe the loss is and how far the hot water may be to blame cannot be determined for some weeks.

Shall he who cannot do much be for that reason excused if he do nothing? —Abraham Lincoln.

KROGH PUMP AND MACHINERY COMPANY

147-159 Beale St., San Francisco, Cal.

Los Angeles Agent, J. B. Van Horn Co.

Krogh Pumps are Absolutely Water Balanced

No End Thrust Possible — No Set Collars Used

The No Trouble Pump

Krogh Direct Motor Driven Pumps

Fitted With Ring Oiling Bearings

Renewable Babbitted Bushings

Ring Oiling Gland

We also build deep well turbines, deep well plungers, horizontal and vertical pumps for mining, irrigation, drainage.

La Habra Heights

Higher and Adjoining East Whittier and La Habra Districts

3,600 acres pronounced by experts the ideal location for avocado and citrus planting. Protected from frost and wind in combination with good soil. Nearly $250,000 spent on irrigation plant, roads and other improvements. The Hacienda Country Club will soon have their golf course and club house finished in this property.

Ideal conditions for avocado and citrus growing. Fine country club for recreation; beautiful homesites.

Any acreage desired. Low prices. Reasonable terms.

Edwin G. Hart

Developer and Exclusive Agent for North Whittier Heights

727-31 Van Nuys Building — Main 2606 — Los Angeles

Order your One and Two Year Old ORANGE, LEMON and GRAPEFRUIT Budded Stock from the

YAMAMOTO CITRUS NURSERY

ESTABLISHED 14 YEARS

Selected Buds From Fruit Growers Supply Co.

Florida Sour Seed Bed Stock at Big Reductions

Trees, delivered by truck, and planted by us under contract, are Guaranteed. Two Year Old Sour Roots and One Year Old from Bud. A-1 Trees, Strong, Big Stock. Ranch—Huntington Drive, San Marino, Cal.

Phone, Alhambra 731-W Mail Address, R. F. D. 1, Box 666, San Gabriel, Cal.

The Insurance Man

sells a policy planned to give the insured an income later in life. His figuring is done on a basis of 5 or 6 per cent interest on money paid by the insured.

California orchards and vineyards, properly planted and cared for, are safe investments and cannot only be relied on to return satisfactory interest on invested capital, but can also be made to build up a fortune in reserve.

These peach trees were propagated and planted by the Kirkman organization in Merced County thirty-two years ago.

In conjunction with the nursery business we have developed and sold many orchards. These are all profitable investments for the purchasers, and if held by them will continue to yield good average profits for many years.

We have confidence in the future of California horticulture and wish to contract to plant and grow orchards on good size tracts, under a satisfactory guarantee that the investor will not sustain a loss; that we will relieve him of his investment wth interest at the expiration of our contract if he so elects.

W. T. Kirkman, Sr., Pasadena, Cal., retired? Guess again. He's been at it for fifty years.

¶ ¶ ¶ ¶ ¶

The fruit trees in our several nursery plants give evidence of fine stock for next winter's planting.

We are making reservations for customers now.

¶ ¶ ¶ ¶ ¶

Fresno, Apr. 30, 1921.

Wm. T. Kirkman, Jr.,
Pres. Kirkman Nurseries, Inc.,
Fresno, Cal.

Dear Sir: It gives me great satisfaction to state that the quarter section of peach orchard you grew for me under contract is a good investment and I plan to hold it permanently, notwithstanding an offer I have had to buy the property at a net profit of $200 per acre to me.

Yours sincerely,

B. LARGE,
Branch Manager Swift & Co.

Kirkman Nurseries, Inc.

Vol. LVI — May 21, 1921 — No. 21

History of a Citrus Tree

All the details of the production of a citrus tree would fill a book. Several of the steps which fit the tree for planting in the orchard are shown in these illustrations taken by the Cultivator camera. Upper left hand photo shows the condition of the "trees" after one year's growth in the seed bed. There are literally hundreds of thousands of trees under this one lath house. The next lower photo, No. 2, is a view over the nursery after the trees have been taken from the lath house and have spent two or three years in the nursery row. Photo No. 3 is a view down the rows. The white stake at the end of the row contains the life history of every tree in the row. From the records on those little posts the prospective orchardist may secure information which will permit him to go to the parent tree and learn its exact production of each grade of fruit for a period of years while it has been under supervision of an expert of the federal department of agriculture. Top center, No. 4, shows the row after trenching has been done. The man with the spade is cutting out the "ball" which is retained around the roots. Photo No. 5 shows the ball cut out, lifted out of the trench, with assistant and shears ready to clip tap and straggling roots. Photo No. 6 shows the completion of the balling operation, the burlap wrap in place with the final tie being made around the stem of the tree. The man standing behind the tree is R. M. Teague. These trees are brought to the end of the row, placed in auto trucks and delivered to the establishing lath house. They may remain here from a week to possibly several months. From this lath house the trees are shipped to all parts of the world. If they are balled photo No. 8 shows the method in which small shipments may be made. In such a package they reach their destination and are planted in the orchard without the tenderest growth ever stopping. Lower photo, No. 9, shows another method of packing in which the balling method is not followed. These trees have bare roots which are protected by a packing of sphagnum.

KIRKMAN NURSERIES

Established in California 1888

A Paying Commercial Orchard from Kirkman Nursery Stock

Growing High Grade Nursery Stock Is a Science

Kirkman Trees are the production of two generations of experience in Nursery Craft. Our trees and vines are grown in twenty-one separate propagating plants in California. Customers are certain of Delivery and from our nearest nursery plant. *We are making reservations now for next season's planting.*

Kirkman Nurseries Main Office: Fresno, Cal.

Agriculture Wins Out at Capitol

By R. P. Royce

THE agricultural industry of California came into its own during the session of the state legislature just closed and for the first time in the history of the industry was accorded the measure of respect it should have been receiving years ago. This new order of things as they should be is due primarily to the official functioning of the Agricultural Legislative Committee and to the efficient activities of the capable secretary, R. N. Wilson. To those who in past years have stood on the side lines and watched the legislative mill in this and other states grind merrily on with little or no attention paid to the needs or wishes of agriculture; or who have watched the poorly organized and practically futile efforts of a few valiant farmers directed toward getting through a useful and needed piece of legislation or an appropriation, and noted with chagrin and almost pity the whipped-dog attitude of these same interests when some especially vicious bill went sailing by in spite of their protests—to one who has watched and wondered in the past, the last session was distinct departure and holds forth reasonable hope that once having tasted of power and victory agriculture will never again be made "the goat."

The accomplishments of the last session were simply made possible through organized effort properly directed.

Taken as a whole it can be said that practically every piece of important legislation that was sponsored by the Legislative Committee was passed. True, nearly all the bills must yet receive the approval of the governor, but with the same influence that saw to the passage of the bills still watching over them it is not unreasonable to expect that they will become laws.

Not the least gratifying feature of the work of the committee is the fact that its work was accomplished with such tact, dignity, determination and frankness as to win the open appreciation of the members of the legislature and the administration leaders.

Unquestionably, the most signal accomplishment on the part of the farm interests was the obtaining of increased appropriations for the college of agriculture and the state department of agriculture. The college needs were thoroughly investigated by representatives of the committee and with few exceptions the requested appropriations were granted. The committee even succeeded in getting the $450,000 that had been eliminated by the board of control. In all, $2,500,000 will be made available to the college of agriculture if the governor signs the various bills.

In connection with the college of agriculture the committee played an important role in the legislative investigation of the college which resulted in a report recommending that a commission of seven members be appointed to make a thorough study of the problem of agricultural education in this and other states. It is expected that this report, which will be made to the next legislature, will result in the adoption of a definite and constructive plan for the development of the college of agriculture.

Largely through the support and activities of the committee the state department of agriculture was granted a large increase in appropriations — in fact, the department got nearly 100 per cent increase and about everything asked for.

A fundamental piece of legislation, calculated to make clear the provisions and limits of the law regulating cooperative associations, sponsored by all the cooperative organizations of the state, was passed. Prior to passage the bills were amended to provide certain supervision by the commissioner of corporations. The net result of the amendments will be to prevent malicious persecution of cooperative organizations.

It being quite impossible to give even a brief digest of all the measures of interest to our readers, the more important follow:

Senate Bill No. 6, by Senator Rigdon, is the "Pure Seed Bill" to prevent the adulteration and mislabeling of agricultural seeds. A companion bill carries an appropriation of $15,000 for enforcement. S. B. 98 by the same author is a tuberculosis eradication bill based on the "free area" theory. As finally amended before passage the bill provides that upon the request of the board of supervisors of any county the director of agriculture may cause a survey to be made to determine the prevalence of tuberculosis and if 90 per cent of the cattle of a county are found to be free from the disease, the county may be declared an eradication area. Considerable opposition has developed on this measure. The opposition is not opposed to the eradication of tuberculosis but is based on the fact that there still exists considerable ambiguity as to what the bill means and what the department intends to do. Not a little opposiion is due to the feeling that the state veterinarian and the author of the bill proceeded without consulting the cattle owners themselves. At this writing a meeting is scheduled to protest the signing of the measure. Assemblyman Cummings, chairman of the agricultural committee of the assembly, is the author of A. B. 38 which provides the machinery for breeders of this state to avail themselves of the opportunity to place their herds on the accredited list. All but three states in the Union are working under this plan, but for some reason it has been impossible to date to get the officials of this state interested to the point of supporting the plan. As the bill finally passed it was shorn of the appropriation to cover indemnity.

A. B. 443 by Broughton gives official recognition to the Mallien test for glanders and provides further that once a bovine has reacted to the tuberculin test and the owner so notified, permission must be obtained from the director of agriculture before selling said animal.

A. B. 1302 by Cummings requires that butter milk, skim milk and whey sold at creameries and destined for feeding must be pasteurized.

S. B. 234 by Rigdon amends the present Hide and Brand law. S. B. 236 by same author requires that notice be given the director of agriculture before the sale of estray animals.

S. B. 119 by Rush regulates the running at large of dogs. This bill has appeared at every session of the legislature since the beginning of time and it is now thought that all objections raised in the past have been eliminated.

S. B. 275 re-enacts the present dairy products standardization law, makes certain definitions and gives the state director of agriculture power to determine the moisture content in cheese.

S. B. 277 by Rush is one of the most important bills introduced. In brief this bill provides for the inspection of slaughter houses. At present only the larger cities and a few retailers using government inspected meats have inspection. Under the bill this inspection will be extended to the smaller communities and will be under the regulation of the director of agriculture.

S. B. 498 by Harris is of vital interest to creamery patrons as it requires that all butterfat tests must be recorded indelibly. It is expected that the law will operate to prevent tests being changed.

S. B. 382 by Rush appropriates $50,000 to be used by the management of the proposed San Francisco Livestock Show.

Of general interest may be mentioned the following bills:

A. B. 910 appropriates $200,000 for the investigation of the storage, control and diversion of water. The bill will provide for part of the Marshall plan.

A. B. 1126 by Bernard is the important "warehouse act." This bill had the support of nearly all agricultural organizations. In brief it provides for the licensing of warehouses and that warehouse receipts for certain products must be based on established grades. S. B. 153 provides for the establishment of grades and standards for grains.

S. B. 201 re-enacts the fruit and vegetables standardization law with certain amendments.

S. B. 202 places the county horticultural commissioners under the authority and direction of the director of agriculture and S. B. 203 fixes the minimum salary of the commissioners. S. B. 204 provides for state wide examinations of the commissioners and that passage of said examinations makes one eligible in any county.

S. B. 247 by Harris relating to the control of the grape mealybug and requiring that picking boxes be sterilized was passed after the request for an appropriation of $30,000 to carry out the intent of the measure was eliminated.

A. B. 392 provides for the continuation of the study and research of beneficial insects. A. B. 380 relates to license fees for nurseries. A. B. 1293 re-enacts the apple standardization law. S. B. 273 regulates the sale of economic poisons and requires such poisons to be labeled. S. B. 231 proposes to restrict the propagation of noxious weeds. S. B. 274 continues the present regulations regarding the control of the walnut codling moth. A. B. 1183 amends the present fertilizer law to provide for certain penalties for violation.

The above list does not include all measures passed by the legislature relating to or of interest to agriculture, but includes the more important. As the various measures are signed by the governor a more detailed digest of them will appear.

Nicotine Dust for Grape Leaf Hopper

By Fred K. Howard

IN THE past the most satisfactory method employed to control the grape leaf hopper was the use of the so-called nicotine soap sprays. These mixtures carried as a killing agent nicotine sulphate or Black Leaf "40," at the rate of one pint to each 200 gallons of water and approximately 5 pounds of whale oil soap, which acted as a spreader for the material. This material is only effective in the control of the nymph and wingless hopper.

The difficulties incident to its use were that it was almost impossible to get a satisfactory coverage except when experienced and conscientious men were handling the spray nozzles. Then, too, the material and the cost of application was sufficiently expensive that many growers hesitated to spend the required amount of money except when the crop was threatened with destruction; consequently, the damage to the grape industry of the state ran into thousands of dollars annually, due to the ravages of this pest which by its feeding habits lowers the vitality of the vines and affects the quality of the crop.

Among the other methods which were used to a limited extent were the so-called hopper cages and suction apparatus which had for its object the collection of the small winged adults in much the same manner as the electric vacuum cleaner. These methods after a few trials have generally been considered both unsatisfactory and expensive.

The grape leaf hopper belongs to that great class of insects which are known as sucking insects because they obtain their food by inserting

Agricultural News Notes of the Pacific Coast

Northern California

Colusa, Colusa County, shipped 3,600 lambs the first week of May.

Last month (April) Petaluma shipped 107 carloads of eggs.

The first carload of cherries shipped this year left Sacramento May 3.

The state land colony at Durham began irrigation with the month of May.

The California Pear Growers Association has begun a membership campaign.

The Livermore Valley shipped east more than 25,000 lambs the first week of May.

Northern field estimates show the state will have 140,000 acres of rice this year.

The official opening of the General Grant and Sequoia national parks will occur on May 24.

The Modern Woodmen of America will hold a state picnic in Bidwell Park, Chico, July 4.

The Orland district of Butte County reports farmers wish to purchase large numbers of dairy cows.

Eggs to the number of 50,000 dozen were shipped from San Francisco to Hawaii the first week of May.

Sacramento Valley grain growers claim their grain elevators paid for themselves in 1920, the first year.

The celery acreage in the Sacramento district is one-half that of 1920, as growers are shipping at a loss.

Unharvested rice of 1920 was burned over large areas of Colusa and Glenn Counties, to allow sowing new crop.

The California Real Estate Association states that less than 40 per cent of the state's farm lands are improved.

Berry growers in that section met at Paradise, Butte County, and organized the Paradise Berry Growers Association.

The large amount of rice laid flat by early 1920 rains has caused an early planting in the Sacramento Valley this year.

A new variety of rice, known as Caloro, is being distributed in the Sacramento Valley by the Sacramento grain association.

Warden Johnston of San Quentin Penitentiary announces 2,000,000 grain bags ready at seven cents, the lowest price in ten years.

Employees of the Southern Pacific to the number of 2,000 will picnic at Bidwell Park, Chico, Butte County, at a near date yet to be set.

One acre of beets of high sugar content harvested near Sacramento amounted to 26 tons and the acreage will now be heavily increased.

Tuolumne County has 713 acres of apples, 124 of pears, 94 of peaches, 65 of walnuts, 257 of clover, 373 of alfalfa, 72 of potatoes and 36 of berries.

Eight counties of the Sacramento Valley report arrests and fines of Japanese berry growers with not one white man violating the standardization law.

Geo. Husmann, in charge of viticultural investigations, U. S. department of agriculture, is now at the Napa experiment station where he will take up work of survey of the viticultural conditions in the valley "with a view to making effective the legislation already put through congress."

Central California

The traveling fig school in the San Joaquin Valley closes May 21.

Coalinga has just shipped a full trainload of sheep to Chicago.

The Stanislaus County Calf Club will hold an exhibit at Turlock, May 24.

Kern County farm bureau says: "Back to diversified farming and prosperity."

Colma, San Mateo County, is shipping new potatoes at the rate of five cars per day.

Fresno announces both routes from there to the Yosemite Valley as being in tip-top shape.

The Valley Fruit Growers Association has new headquarters at 717 South Broadway, Fresno.

Two and a quarter million grape vines were planted in Stanislaus County during the past spring.

Of 3,000 tons of figs on hand in the Fresno district, February 1, but 600 tons remain in warehouses.

Watsonville apple growers now anticipate but 1,500 carloads as against the 3,000 anticipated early in this year.

Stanislaus County has enjoyed the heaviest orchard planting during this year of any since fruit tree planting began.

The Santa Cruz County supervisors have yielded to the women's clubs and will have a farm bureau home demonstrator.

A packing plant will be established at San Jose to place in cold storage strawberries for later use at soda fountains.

Tulare County leads the state in olives, with 5,460 acres. Butte County has 5,210, Tehama 3,074, and Los Angeles 3,047 acres.

A rabbit drive held in Hammill Valley, Inyo County, May 15, netted several thousand bunnies lately engaged in destroying crops.

A Watsonville, Santa Cruz County, man has perfected a new berry crate that is meeting with general approval. It is known as the Eaton.

The Pajaro Valley farm centers have been having tractor adjustment demonstrations conducted by Mr. Fletcher of the engineering division of the state university.

The Salinas farm center has adopted a schedule of wages. General farm labor is to be paid $2 per day, team of horses $1, experienced tractor driver $4, irrigators 30 cents per hour.

The Caruthers farm bureau center of Fresno County will entertain the traveling farm bureau conference with a dinner May 25. The conference will be the guests of the Sanger bureau May 26.

Fruit and vegetable growers of the San Joaquin and Sacramento Valleys sent representatives to San Francisco last week to register complaint with the interstate commerce commission against the present high freight rates.

Horticultural Commissioner Rutherford of Stanislaus County says: "If your grapevines are frosted to a point below the cluster of grapes break the entire new growth away to last year's wood. The dormant bud on the old wood at the base of the cane removed will start growth and bear fruit."

Southern California

The Valencia orange show at Anaheim closes May 22.

Orange County Valencia packing houses are now running full handed.

The California Association of Bankers will convene at San Diego, May 26-28.

Los Angeles County announces a normal acreage of bean planting, about 64,000 acres.

Coachella Valley put the first apricots of the season on the San Francisco market.

Escondido Progressive Poultry Club met last week and discussed marketing questions.

Santa Barbara County Fair Association has purchased a new site at a cost of $200,000.

The California Walnut Growers Association handled in 1920 80 1/5 per cent of the state's crop.

The summer meeting of the Citrus Institute will be held at Whittier during the latter half of June.

The Los Angeles County farm bureau potato department will hold its next field meet about June 1.

Cotton growers of Coachella Valley, under name of Acala Cotton Growers, held annual meeting last week.

Lettuce shipments from the Imperial Valley have been one-sixth heavier than for same period of 1920.

The Ventura County farm adviser is distributing black wattle (acacia) seed to induce planting for tanbark.

The Colorado River at Yuma is now four feet higher than same date in 1918, and Imperial Valley ranchers are rejoicing over the news.

The Saticoy, Ventura County, Walnut Growers Association led the world in walnut shipments in 1921, the record being 5,270,500 pounds of nuts.

Prof. Quayle of the citrus experiment station reports possibility of a saving of nearly 50 per cent in cost of gas under the new gas-tight tents.

Farm Adviser Hodgson of Los Angeles County says much rot of seed potatoes after planting this year was due to too long baths in formaldehyde.

Sugar beets that are immune from ravages of leaf hoppers are being selected in Riverside County by agents of the United States department of agriculture.

Walnut growers departments are to be organized in the Los Angeles farm bureau. Part of the program is the holding of a walnut growers institute in the winter.

Investigations by Horticultural Commissioner Ryan's office show that in the city of Los Angeles last year there were sold 228,506 crates of strawberries. The average price was $3.75 per crate.

A Los Angeles County lumber dealer has announced that he will test the constitutionality of the law limiting weight of loads on trucks. Two of his drivers have been found guilty of driving overloads.

Delegates from Palo Verde Valley to the Southern National Highway Conference in New Mexico returned with claim that their efforts were successful in having the Blythe route adopted as part of the National Highway.

The Coast and General

The second cutting of alfalfa is progressing in the Southwest.

A few lots of No. 2 Pima cotton sold for 33 cents. This is the highest price so far this season in the Salt River Valley.

Chandler, Arizona, celebrated its ninth birthday May 17. A big basket picnic, dance and other features on the program.

Sugar factory representatives estimate California's 1921 planting of sugar beets at 130,000 acres, practically the same as in 1920.

A branch of the state university experiment station to be devoted to study of citrus problems has been established near Lake Alfred in Polk County, Florida.

R. C. Paulus was elected general manager of the Oregon Growers Cooperative Association at the recent annual meeting. C. I. Lewis was made assistant manager.

The rumor that the new concrete highway in Maricopa County, Arizona, was buckling seriously in certain places has been declared by the engineers to be erroneous.

The secretary of the livestock sanitary board reports there is a healthy demand for pasture and that many cattle are being brought into the Salt River and Yuma Valleys for pasture.

The Lyman dam, which is being built largely with state capital in northern Arizona, was completed May 7. This will irrigate 15,000 acres. It is possible that 5,000 acres will be added soon.

Senator Ashurst of Arizona has proposed a duty of 20 cents per pound on long staple cotton and Senator Jones of New Mexico a tariff of 15 per cent ad valorem on all importations of hides.

About 750 cubic yards of earth daily is being moved in the construction of the Williamson Valley irrigation dam in Yavapai County, Arizona. It is expected that this dam will be completed during the summer.

Permanent organization of the Kittitas County, Washington, Wool Growers Association has been effected. Among other more general work for the benefit of wool growers the association has for its object the pooling of Kittitas County wool.

Crop reports from Arizona: "Oranges have set better than normal in Yuma County, the grapefruit hardly so well, while citrus fruit are normally good and olives better in Maricopa County. Fruits have been damaged somewhat by frost in parts of Yavapai and Coconino Counties."

The forest service regulation recently put in force declares that any injury done to roads or trails in U. S. national forests will be regarded as an act of trespass. The driving of sheep or cattle over roads or trails which results in injuring the roads will come under the ruling.

The first shipment of Yakima (Washington) wool ever routed through the Panama Canal to the eastern seaboard was reccently shipped by H. S. Coffin, who sent three carloads to Boston by rail and water, thus saving $1.10 per hundred in freight charges. It is expected that much of the 1921 clip will follow the same line of least resistance.

The History of a Citrus Tree

By C. B. Messenger

SOME two score years ago when the total output of California citrus orchards was under 1,000 carloads, William A. Spalding, admirer of the orange, wrote on "The Orange: Its Culture in California." His opening sentences are:

"There is that about the cultivation of the orange which attracts people. Call it a glamour or what you will, the fact remains that many who have hardly given a second thought to horticulture their lives long, seeing the orange tree, fall beneath its spell and become henceforth its most ardent devotees—toiling for it, spending their money for it, and even undergoing privations that they may possess it. I do not know that this subtle influence is capable of analysis; I only know that it exists. But sometimes in thinking upon this subject the fancy has struck me that the orange tree knows very well how to gauge a man—has the faculty, so to speak, of approaching him on every side at once."

The mutual interest between orange tree and human has even increased in these 40 years, and we can still wonder what the orange tree is thinking of some of us who are humans and are supposed to give to this favorite of fruits proper care and environment. Sure it is that some citrus orchards show their inhabitants in heartbreaking condition. Writers in the horticultural press, investigators of the university and fruit growers generally have aided in the study of these trees and their requirements, and some of the growers have utilized the results of these investigations and the spreading of the information, and wonderfully beautiful and productive citrus trees have resulted.

From a purely financial standpoint, when one considers the cost of land, of its preparation for irrigation, of the tree, and of its planting and subsequent care until of bearing age, tragedy appears in the condition of many orchards.

But this page this week is not to be given to a discussion of orchard care or moralizing on the economic loss from lack of that care, but to a bit of observation as to producing from the tiny seed the tree ready for the orchard.

Again quoting from Spalding: "The man who contemplates planting an orange orchard, especially the man of limited means, ought to stop and think twice. He should consider that it is a great undertaking to raise orange trees, and he should also bear in mind that during the long period in which they are attaining maturity his family and himself must have a living. If, after weighing the matter carefully, he comes to the conclusion that he is possessed of the requisite courage, perseverence, energy and thrift for the undertaking, with a natural taste for it which will make his labors and trials endurable, and if he thinks he can see his way clear to keep the pot boiling through several non-producing years, why, let him go ahead, and God speed him! He is embarking in a good enterprise and one that will surely bring its reward if intelligently carried through."

To carry through intelligently he must needs begin with the right tree. And this making of the tree which has been used as a foundation for California's great citrus industry has resulted in the upbuilding of a great business. One of the greatest representatives of this business of producing trees is the Teague Nurseries at San Dimas. Not only have trees been supplied from these nurseries for the making of California orchards but hardly a country in the semi-tropic world but has drawn upon them. Some half dozen years ago the Cultivator received inquiry from a subscriber in the highlands of India. He had received a consignment of orange trees from these nurseries which had been a few days over three months in transit. All but two of the trees had started and were in full growth. These two remained green of bark but refused to send out new leaves. Ability to ship trees half way round the world indicates intensive specializing in growing and handling such stuff. So it's a bit interesting to know the steps necessary in the production of these trees.

The planting of the seed, some in lath house, some in open ground, the care of those seed for an entire year, the pricking out or the replanting of the young trees in nursery row, their care, the securing of budwood, the placing of buds, the cutting of the twine or the waxed cloth—the latter being the more generally used today—the driving of stakes, the patient tying week by week of the young bud as it continues to grow, the pinching or topping so that the branches make a perfectly balanced young orchard tree, the trenching, cutting the taproot, balling, or lifting of bare roots, the curing or establishing and placing in the orchard, all are matters of most intense interest, and the understanding of these various steps will help us to have better appreciation in real dollars of what the tree ready for the orchard represents. So we asked one of the most practical growers, William R. Wood, to give outline of the practical steps taken in tree production.

By William R. Wood

HOW few of us stop to think when we see a beautiful citrus grove just how much work was necessary to bring it to its present mature condition. We may consider it from the time the young trees were first set out in orchard form, but few of us allow our thoughts to go back to the starting of the trees from the seed.

Not long since the writer, with a friend, was passing through a section of well cared for groves, the trees having responded to the care by producing bountiful crops of the golden fruits that weighted the limbs and made them appear like Christmas trees loaded with Yuletide greetings. My friend remarked, "What a beautiful sight and how interesting it must be to work among such surroudings." "Yes," I replied, "and I helped grow the trees in this particular grove from the seed to the time they were planted in orchard form." My thoughts wandered back to the time when, as a boy, I helped extract the seed from cull oranges that formed the root stocks for this orchard.

It was customary in those days to buy the seedling orange culls either from the orchardists or packing house and extract the seed for the root stocks. There were a good many seedling orchards grown from Tahiti seed which was considered about the best for this purpose. These were known as sweet orange seedlings, the use of Florida sour orange seed for root stocks being almost unknown in California at that time.

We cut the oranges in halves and with an arrangement something like the old fashioned lemon squeezer pressed out the seed, cleaning out the pulp by washing it through screens for a number of days. In this way we managed to get the seed fairly well cleaned, and it was then kept in water which was changed daily until ready to plant. At the present time very little of this seed is used, practically all of the root stocks being grown from sour orange seed shipped in from Florida, the sour orange seedlings being hardier and more resistant to root diseases.

The seed is usually planted in April or May, either in beds or drills, and covered with sand to prevent the soil from baking or crusting over, and these are kept watered just enough to hold the moisture around the seed which will start to grow in from two to four weeks, depending on condition at time of planting. If planted in good soil the seedlings will be from 8 to 16 inches in height by the following spring and are ready to transplant in the nursery row. The former practice was to wet the beds thoroughly and loosen the soil around the plants with spading forks and pull up the largest for transplanting, leaving the remainder to grow another year, but the present mode of procedure, as recommended by those having made a study of root stocks, is to dig up the entire bed, using only the strongest and best plants for root stocks and discarding the remainder. By this method from 40 to 60 per cent of the plants are discarded.

As the plants are taken up they are packed in wet moss and transplanted to the field where they are lined out in rows four feet apart and about 15 inches in the row, the water closely following the planters so that only a few minutes elapses from the time the seedling is placed in the ground until the water settles the earth around it. As soon as dry enough the soil is carefully hoed around the plants to prevent their drying out, and water is again applied within a week or ten days, depending on the weather. Hoeing, cultivating and irrigating constitute the principal part of the first year's work on the seedlings, but this must be properly attended to if maximum growth is to be expected. Beginning the second year the seedlings are pruned up to one straight stalk to a height of eight to ten inches from the ground, and this stem is kept free from sprouts so as to form a smooth stock for budding the following fall or spring. The irrigation, cultivating and hoeing is continued as in the first year, care being taken to see that the plants do not suffer for want of moisture, a condition that is detrimental to the root system and often times accounts for trees not doing well after they are transplanted to the orchard.

Budding is usually done in the fall or spring, September and October being the fall months and April and May the spring months.

The former practice was to select budwood from bearing orchards of the variety desired, but with the advent of what is known as "bud selection" it is now considered impracticable to use any budwood excepting from trees with a known performance record for productivity and quality. The Fruit Growers Supply Company (a subsidiary corporation of the California Fruit Growers Exchange) maintains a bud selection department and furnishes budwood from record bearing trees, and the bulk of the nursery stock is now being budded from this class of buds.

Budding is usually done by professional budders at so much per thousand trees, the contractor putting in the buds, wrapping them and taking off the wraps at the proper time. With spring budding the tops are cut off about six to eight inches above the buds very soon after the wraps are taken off. This forces the buds to start out at once. With fall budding, however, the tops are not cut off until the following spring after the danger of frost is over, the buds lying dormant through the winter.

As soon as the seedling tops are cut off the buds are staked, that is a stake, usually a four foot lath sharpened at one end so as to facilitate driving, is driven in the ground as close to the seedling as possible and on the same side of the bud. This causes the buds to grow straight up with very little crook. Some nurserymen prefer to let the buds get out six or eight inches before staking and tie them up to the stump first. Either way is good provided the work is done properly and at the right time.

As the buds grow they are kept tied to the lath so as to keep them straight. All sprouts or suckers are kept off the seedling stump and any side limbs or shoots that may come out on the buds are taken off. This work is important as it gives the buds more vigor and makes a much better appearing tree. When the buds reach a height of 30 inches or more and the wood is well rounded out they are topped at a uniform height of 28 or 30 inches from the ground and limbs are allowed to grow to form a crown or head. These limbs should be as evenly distributed as possible so as to form a uniform head, all limbs being kept from the top down about eight inches. All limbs coming out lower than this are kept pruned off the same as when the buds are first started.

The buds usually reach the proper height for topping in July or August and are sufficiently hardened up so that it is safe at this time to cut off the seedling stump just above where the bud started. This is called "stumping" and is done with a hack saw, the cut being made at an angle of about 30 degrees and close enough to the bud so that it will heal over readily and at the same time not weaken the bud. The cut is immediately painted over with shellac or paint of sufficient body so that all moisture is kept out. This prevents decay, a condition that may weaken the tree in after years.

At one year of age, or the following spring after the buds have started, they should caliper ⅜ to ¾ inch at the bud, although a certain percentage will not reach this size, depending on the soil and care they have had. It is safe to say that under normal conditions 50 to 75 per cent will be large enough to transplant for those desiring one year stock. The remainder must stay in the nursery another year.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Only a part of the story of the orange trees is told by the illustrations on the cover, but that portion makes most vivid some of the steps through which the tree must pass. One picture there shows the seedbed, another the trees in nursery row, another gives something of an idea of the extent of the nursery and, perhaps more interesting, the method of "balling" or taking the tree out of the ground with sufficient soil about the roots that it may even continue its growth started so favorably in nursery row.

* * *

Another scene shows the method of establishing or getting the tree ready for its new conditions in the orchard. They are delivered from the nursery by truck, placed in the lath house, and the balls kept well moistened for a time until required for the orchard. By that time perhaps new growth is coming along on the trunk of the new tree. It is placed in the orchard, thoroughly irrigated and scarcely realizes its changed conditions but continues its new growth until in seemingly but a few days it takes up the business of producing food for human beings.

* * *

It costs money to produce a nursery tree. Especially is this the case where the tree is grown as it should be. One point we will mention, perhaps seldom thought of in connection with cost of production, is the selection of the bud. We recently stood looking down between two long rows of orange trees ready for orchard planting. We asked the nurseryman what kind of a record he was keeping on the little white stakes at the end and often at intervals through the entire row, and he was quick with the information that the record on those little stakes meant everything to him in selling the tree and to the grower in planting it.

* * *

In the first place the federal department of agriculture sent Mr. Shamel to California to study the problem of the grower in securing a more uniformly productive orchard, more uniformly productive and more productive of uniform fruit. Year after year this study was continued and the little white stake in the nursery row is a history of that work. The buyer of the tree is given information which will enable him to go direct to the parent tree from which the bud was selected. From the tree he goes to the owner or to records which tell him the production year by year of the parent tree. Still more, he will be told that that particular bud was taken from wood of known bearing performance. The tree may be at Riverside; it may be at Redlands, or it may be in Tulare County, but its number and all about it may be determined from these little stakes.

* * *

This matter of bud selection and the care which California nurserymen are giving to the making of trees has resulted in still greater California horticulture. In years to come we believe the pilgrimage of European, East Indian, South African, South American and Australian fruit growers to learn how California does it will greatly increase.

* * *

Another popular priced automobile has announced material decline in its price. Farm implements generally are more reasonable in price than they were a year ago, and while it takes considerable nerve on the part of a farmer to buy farm implements on a reducing market, there is opportunity for consideration of many points in this restoration to normalcy. It is probable the old before-war prices will never return. One large implement manufacturer in announcing a ten per cent reduction in plows, cultivators, harrows, planters, binders, mowers, etc., says that raw materials have been purchased at the higher prices and that in its 1921 production it consequently receives no benefit of the recent reduction in the price of steel. The steel reduction, however, does furnish a new basis of replacement cost, and even though this reduction in price means a tremendous loss to the company, nevertheless it is willing to take the consequent loss in the hope that it will benefit the farmer in enabling him to buy more economically the implements he needs and at the same time increase the market for his products by giving employment to factory workers.

We think it an especially fine omen in that this number of the California Cultivator is issued May 21, 1921 and is No. 21. It sounds at least as if we were reaching our majority. In any case it is a fine number for our contributors have done exceptionally well in sending in some remarkably good copy. And the copy is not all "reading matter." As we have reminded our readers before some of the most instructive, most inspiring and sure the most optimistic reading in an up to date farm magazine is that which is within the advertising columns. The modern day farmer who fails to read advertisments soon ceases to be a modern day farmer.

* * *

There are a lot of funny folks in this world. Some of them are in California. The Pacific fleet has been sent to the Pacific Coast . The Pacific Coast has no station with proper equipment, which is able to keep the ships fit for fighting. Congress is expected to make such appropriations, appropriations which common sense dictates are needed for the protection of the coast and the entire country. Instead of encouraging this movement on the part of congress we Californians proceed to engage in a petty, even nasty, scrap, which is disgusting the powers that be and working for a condition which now makes it appear that the appropriation will be entirely withheld.

* * *

The state highway commission is confronted by a similar manifestation of petty selfishness. It is suggested that a certain strip of road in a certain county is to receive exact location. The first question uppermost in the minds of those to be benefited is "Does the proposed road go by my door or that of my neighbor?" In the hair pulling and face scratching which ensues the one big fact of public benefit is entirely lost sight of, and there have been occasions when such scraps have caused the loss of the improvement to the entire community. Too bad we can't be a little bit bigger.

"CALIFORNIA"

We are glad that the promotion interests that are working for the development of the interior valley of California have decided that there is no word like "California." For it's a grand old word.

And it is a very useable word. The modifications that have been made upon it do not vary its character. And there is enough of it to go around, in reputation, to provide every foot in the state with a golden glow. From Mount Shasta to Fort Tejon, all this interior valley of the state breathes "California." It is California.

It is all California in esse and in posse alike. It is California as it is and California as it can be and will be. Not only can people be here and "live" California, but they can work California. They do not need to talk Northern California or Southern California, or Superior California or Central California. In fact, any of these directional phrases can be properly used as occasional indications of local relationship, but they should be avoided as symbols of exclusive kinship.

The use of any prefix to the name of California has, we are convinced, arisen from a misunderstanding of the needs of advertising. Whatever any misguided person may do about this, we hope that no other persons will imitate his example. It is not good business for the state nor for any part of the state. Mount Lassen is not in Northern California, but in California. Nor are the great waters of the Sacramento Valley anywhere but in California. Nor are the rich fields of Glenn and Yuba and adjoining counties anywhere but in California. Let us say so, and nothing else except for the mere purpose of directing the incoming settler or tourists.

We are paying a lot for our state highways. But they have been worth a lot for this alone: That they have made it easier for us to rub shoulders with our fellow citizens of California. God bless them! — Fresno Republican.

A BETTER COLLEGE

The governor has not yet signed S. B. 981, appropriating $450,000, a special above the budget fund for the college of agriculture,, but there is still a full week before the enactments of the legislature will die if the governor does not sign. All friends of the college are hoping that the governor will make this appropriation effective.

VALENCIA WEEK

This is orange show week at Anaheim. It is Valencia week. The late orange is not demanding absolute exclusion of other varieties but naturally Orange County, being a Valencia county, it's presenting a Valencia show and Valencia is queen. Its importance to the citrus industry is more appreciated by a look in at Anaheim, whose latchstring is out.

HOME CANNERS

Since the first suggestions several years ago of the home canner as a means of saving of orchard wastes the Cultivator has persisted in urging the use of this food saving devise. All too often abnormal crop or marketing conditions make for loss to the producer, and sometimes a loss so serious as to jeopardize the investment and even the home of the orchardist. The best insurance against such loss may be through cooperation, especially a cooperative cannery or a cooperative dry yard. This insurance is not always possible. And even some times where it is possible the added insurance which comes from the possession of the home canner makes most profitable the investment of that institution. These canners are now put up so that the producer who is willing to follow instructions may produce a pack the equal of the professional canner. His perishable product is then almost imperishable and he may wait the turn of the market which permits profitable disposal. It pays to be sure and insured.

FIRE PREVENTION WEEK

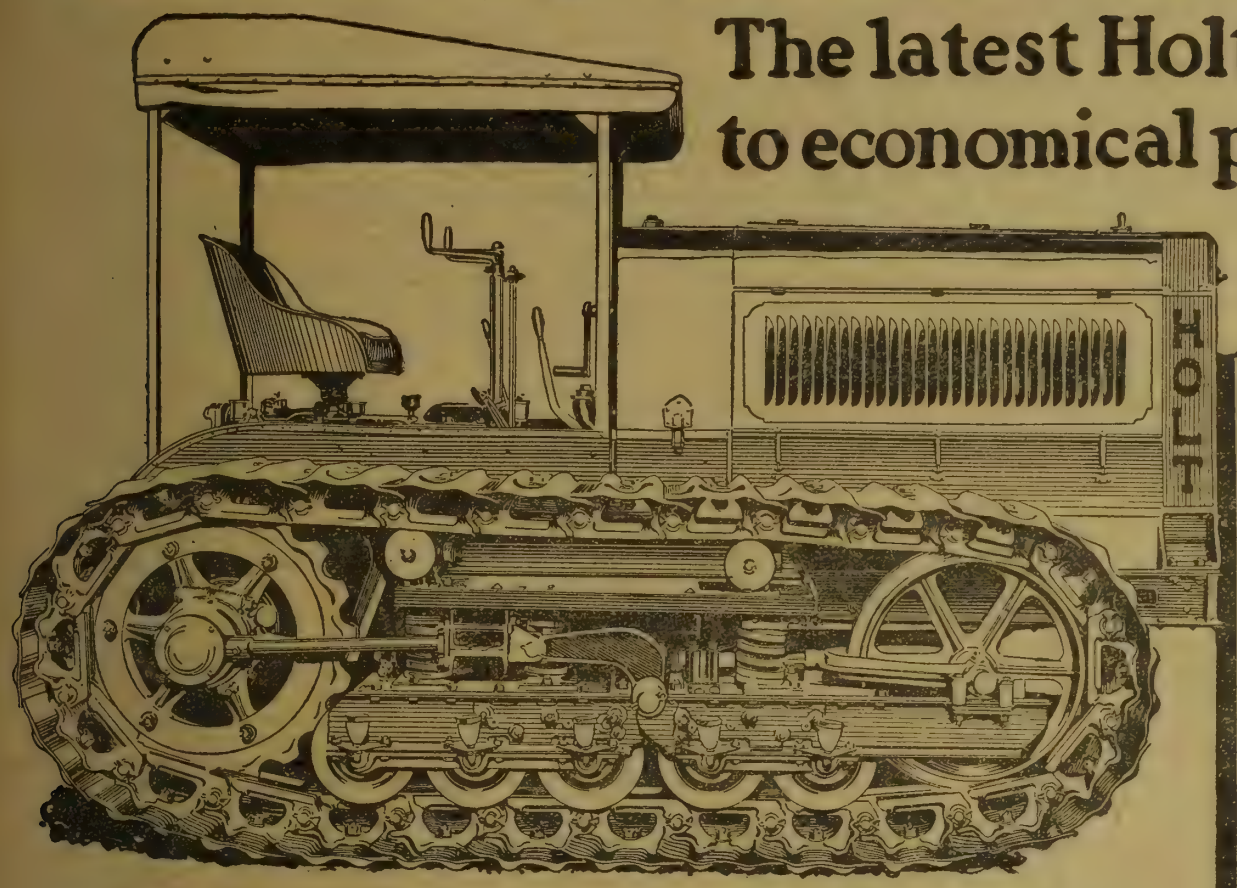
Two weeks ago the place-of honor editorial in the center of the page was written by Governor Stephens. It had to do with a proclamation issued from the executive department of the state of California, naming the week of May 22-28 as "Forest Protection and Fire Prevention Week." It is noted that it begins on Sunday and that Governor Stephens suggested "Let ministers instruct their congregations," and others who have opportunity like teachers, farm bureaus, boy scouts, women's clubs, chambers of commerce, railroads, lumbermen, fishermen—All who use the forest or even who live in California, instruct in true patriotic effort to lessen fires and fire destruction in our homes, on our farms, along the roadside, from our campfires—everywhere "Prevent Fires."

Nor is the one week sufficient. May it be the inspiration of "Forest Protection and Fire Prevention Year."

And, too, it is well to bear in mind that in planning for building construction or for storage of valuable equipment proper construction may mean as much in fire prevention as does personal care and attention. The carelessly constructed flue or an outbuilding with weeds permitted to dry and remain as possible fire carriers may endanger our property, even our own existence. California's dry summers make for special attention in this matter of construction plans and water systems.

New Western 10-Ton "Caterpillar" Tractor

The latest Holt contribution to economical power-farming



More years of tractor-building experience than can be found in any other tractor are summed up in this newest Holt product—the Western model, specially designed to meet Pacific Coast conditions, of the world-famous "Caterpillar" 10-Ton Tractor.

The Holt Line

The Holt line includes, besides the Western 10-Ton, the 75 horsepower model of the "Caterpillar" Tractor, unequalled for power and ability to handle the biggest jobs efficiently and economically; "Caterpillar" 45 Tractor, for the medium power requirements; "Caterpillar" 5-Ton Tractor, the most versatile, powerful and dependable small tractor for farm, orchard or highway work. Holt line of combined harvesters includes a size and type for every condition of ground, grade or grain—from the big Standard model to the new little one-man four-horse harvester. "Caterpillar" Disc Plows offer plowing equipment of the same high grade of construction and dependable service as the "Caterpillar" Tractor. For leveling work, there is the "Caterpillar" Land Leveler built in three sizes. Write for detailed information on any or all of these Holt products.

Power, economy, dependability, flexibility, long-life—every advantage you look for in a tractor is in this one—in greatest measure. It has scores of valuable new features.

It develops more than 60 horsepower. Its operating cost is less than that of other tractors of equal or even higher power-rating. The Western 10-Ton "Caterpillar" Tractor is built along commonsense engineering lines. No other tractor can approach it in long life and low upkeep costs. Here is a tractor that will do your work *when* and *how* you want it done—at lowest cost per horsepower hour.

Get full information at once about this latest and greatest Holt achievement in the tractor line. Write us or ask the nearest Holt representative.

For Vineyard Economy

These features in the American Beauty Dust Sprayer are reasons for its economy:

1. Low purchase price and no need for repairs.
2. Operated by one man.
3. Simple construction—few moving parts.
4. Material applied only where needed—none wasted.
5. Its powerful blast penetrates all parts of plant, giving perfect protection.
6. One man covers great acreages in vineyard work.

A very small quantity of the dust well distributed and covering every part of the infested plant is by far the most economical method of controlling Aphis, Thrips, Leaf Hopper, Mildew and other pests.

Destroy the Vine Leaf Hopper

Recent exhaustive tests at Fresno under the supervision of the California Raisin Growers Association have demonstrated the efficiency of our Nicotine-Sulphur Dusts, showing the greatest precentage of kill in the control of Vine Leaf Hopper of any dusts obtainable. For best results use "Calispray" dusts made in our own factory—a brand ready prepared, for every insect pest.

Fruits and Nuts: Then and Low

Conclusion of Address Made by Prof. M. E. Jaffa Before Claremont Pomological Club

The summary of Hoebler's conclusions in re the nut diet is as follows:

"In attempting to determine the efficiency of any diet fed, factors which must be considered are: quantity of the milk produced; caloric value of the milk produced, and loss or gain of tissue of the mother producing the milk.

"In Table 1 are submitted the details of the observations which cover these points. From the standpoint of quantity of milk, Diet 10, made up of nut protein supplemented by vegetable protein only, produced an average of 1,234 calories, over 100 calories above any other diet; also an average of 1,689 cubic centimeters of milk in 24 hours. From the standpoint of protection of material tissues one of the mothers showed a nitrogen efficiency of 5.3 per cent and the other of 13.8 per cent. Thus in the three essential standards Diet 10 produced the best results. It is not intended to convey the impression that this diet would always accomplish the same good results, for while it produced the same general results in each of the mothers under observation a much wider application of such a diet must be undertaken before a definite decision can be reached; but such were the findings in this observation, and it is for those interested to test it clinically.

"The actual ingredients of the diet are given in Table 2. The diet contained approximately 2,670 calories. The ratio of protein to fat and carbohydrate (all reduced to basis of calories) was 1:5. The actual grams of protein ingested was 104.68, yielding 16.75 grams of nitrogen. Of this intake 89 per cent was absorbed. The mothers took the diet readily, and in fact enjoyed it.

"Table 2. Ingredients (in grams) of Diet 10 (Nut Diet): Malted nuts 100, protose (nut products) 150, pecans 25, almonds 25, walnuts 25, peanut butter 50, cocoa 8, chocolate 8, bread 200, potatoes 200, lima beans 100, peas 200, bananas 100, apple sauce 50.

"This diet demonstrates that the biologic character of vegetable protein, particularly if composed largely of nut protein, is not incompatible with a production of milk protein whose biologic character is entirely different.

"This does not hold true when a pure vegetable diet from cereals, vegetables and fruits, is given."

Cajori states as result of his investigation: "Satisfactory growth was observed in young rats on diets in which the almond, English walnut, filbert and pine nut, respectively, furnished the essential source of protein in the ration.

"Normal growth can be secured when rats are fed upon otherwise adequate diets containing the almond, English walnut, black walnut, Brazil nut, chestnut, or pecan as the sole source of water-soluble vitamine. Animals which have declined on a diet devoid of water-soluble vitamine promptly recover when the almond, English walnut, filbert, hickory, pine nut, chestnut, or pecan is introduced in the diet. These observations indicate that nuts are sources of abundant quantities of water-soluble vitamine.

"The proteins of the almond, English walnut, pine nut or filbert furnish the necessary nitrogenous complexes for the elaboration of milk in rats."

The important conclusion from Holmes' paper is that peanut protein is a valuable source of some of the most important amino acids, particularly lysine, so necessary for growth. Furthermore, it is shown that the digestion coefficient of such protein averages 86 per cent. This is a higher figure than that recorded for the protein of any of the whole cereal meals, such as graham flour, oatmeal, corn meal, etc.

Summarizing the foregoing presentation of the subject it would appear:

That the nutritional knowledge 25 years ago of fruits and nuts was practically limited to the results of approximate chemical analysis indicating the percentages of protein, fat, carbohydrates, acid and mineral matter. The fat of the fruit and nuts in, and their value to, the body was little understood.

That during recent years there has been aroused a much fuller appreciation of fruits and nuts based on: Nutritional studies and metabolism experiments showing conclusively that the availability to the body of the nutrients in fruits and nuts compares very favorably with that of other foods. Nutrition investigations on the function of mineral elements in nutrition have made it clear that the mineral ingredients of fruits are highly essential for maintaining the mineral equilibrium of the body. Most recent studes on vitamines show that fruits and nuts are to be considered as sources of the anti-neuritic vitamine, water-soluble B; and the anti-scorbutic vitamine, watersoluble C.

Fruits and nuts should be considered as dietary essentials, not as food accessories or luxuries. They therefore should be classed, nutritionally, as important as other staples ordinarily found in the menu.

HISTORY OF A CITRUS TREE

(Continued from Page 673.)

and of these possibly 50 per cent will make marketable trees and the remainder must be dug up and thrown away.

In taking up trees two methods are used, viz: balled and open roots. In balling the roots are cut out with 40 to 60 pounds of the soil they are grown in so that the roots contained therein are undisturbed. A trench 16 to 18 inches deep is dug along one side of the tree and the tap root cut at the desired depth, usually about 14 inches from the surface, and with a sharp spade a ball of earth is cut out about eight to ten inches in diameter, care being taken to keep about the same distance from the tree all around. The ball is then lifted out and placed in a burlap sack. For this purpose a grain or other sack of about that size is cut in two, each one making two balling sacks. The ball being placed in the center of this sack, the four corners are brought up tightly and tied around the trunk of the tree just above the ball, with balling twine, the twine being long enough so that it is brought down the side of the ball and two or three loops taken around the ball. The twine is then passed under the ball and up the opposite side, fastened to each of the loops and then again looped around the trunk of the tree. The twine must be kept tight at all times and fastened firmly so that in handling the roots will not be shaken loose in the ball.

With the open root method the trees are taken up without any soil on the roots and immediately packed in moss to prevent them drying out. When the trees are to be shipped any distance they are carefully packed in boxes with sufficient damp moss to prevent them from either drying out or heating. If properly packed they will keep in perfect condition for two or three months provided just a little water is applied every month or six weeks.

For local planting it is not necessary to be so particular with the packing but sufficient material must be used to prevent the roots from being exposed to either the sun or wind or the tree is very apt to die.

The trees being either balled or packed open roots they are ready for delivery to the planter and the work of the nurseryman is completed. It will be seen, however, that several years have passed since the seed was first taken from the oranges, as well as a lot of hard and painstaking work, all of which is absolutely necessary in growing first class stock.

If the planter will now use the same care in planting and caring for his orchard he will be assured a first class orchard, provided of course he has selected a location where soil and climatic conditions are proper for citrus culture.

* * *

The high spots on the History and Botany of the orance tree are:

By Ernest Braunton

Historians are seemingly well

agreed that the orange and lemon are natives to southern Asia and the East Indies. The Arabs, then under the leadership of the great Mohammed, are thought to have first introduced the fruits to Europe. They were first planted in Sicily early in the ninth century. We know there were flourishing orchards in Italy long before the discovery of America.

The Spanish Catholic missionaries first distributed the seeds of the sour orange in Florida long before any were brought to California, and they soon ran wild over large areas. Shortly after the sweet orange followed the sour, or Seville. The date of the entry of the orange to California is obscure; it was some years before 1800 and was established at the San Gabriel Mission. The first orchard of seedlings was planted near the mission about 1804. The first of our named varieties to reach California was the Mediterranean Sweet, imported by Thos. A. Garey about 1870, and it was followed by the sending of the Washington Navel to Riverside in 1873, the trees having reached Washington, D. C., from Bahia, Brazil. But it was not until 1879 that its superior value was recognized and large quantities of seedlings budded to Navels.

Botanically the orange, lemon, citron, lime, etc., belong to the genus citrus, an ancient name of a fragrant African wood, afterward transferred to the citron. It has become an English word used to designate the entire cultivated family group. All are native to tropical and subtropical parts of Asia and the Malayan Archipelago. The species that are the parents of all cultivated citrus fruits are six in number: Citrus Medica, the citron; Citrus Limonia, the lemon; Citrus aurantifolia, the lime; Citrus grandis, pomelo and shaddock; Citrus Aurantium, the sour or Seville orange; Citrus Sinensis, the sweet or common orange. All named varieties have sprung from these and in turn these named varieties have been further crossed to produce such fruits as the citrange, a cross between the sweet orange and the deciduous hardy Citrus trifoliata: the limequat, a cross between the lime and kumquat; the tangelo, a cross between the tangerine and the pomelo; and numerous others, some freaks of doubtful value. New named varieties of merit are constantly being bred or discovered as chance crosses. The last meritorious claimant for popular favor is the Temple, originated in Florida, where it promises to be a leader. R. M. Teague has made arrangements with the United States department of agriculture whereby this variety will be introduced to California, and it is expected budded trees will be obtainable in 1922.

AVOCADO OIL CONTENT

In his paper on maturity work on avocados before the Pasadena meeting of Avocado Growers, E. M. Chace, chemist United States department of agriculture, gave a list of varieties with their fat content, as follows: Fuerte, 29.6 per cent; Lyon, 26.9; Puebla, 26.5; Blakeman, 21.6; Taft, 18.9; Spinks, 18.5; Sharpless, 18.4; Dickinson, 14.4. The smallest per cent of seed was in the Fuerte and Lyon. The lowest per cent of fiber was in the Taft; second lowest in Spinks and Sharpless. All these figures will no doubt vary with season and location.

The amount of edible material was found to be highest in the Fuerte, closely followed by the Sharpless and the others in the order named: Lyon, Blakeman, Taft, Spinks, Puebla, Dickinson. The Blakeman has the smallest per cent of skin and the others, in order, are: Fuerte, Puebla, Spinks, Sharpless, Taft, Lyon, Dickinson. The per cent of seed was lowest in the Lyon and Fuerte to the same amount, with Sharpless a close third. Then followed Blakeman, Taft, Dickinson, Spinks and Puebla.

The protein content of avocados is remarkably high among fruits, and the eight varieties stand as follows: Lyon, Spinks, Blakeman, Puebla, Fuerte, Taft, Sharpless, Dickinson. The month in which the greatest content was found, which is the time at which they are surely mature, is here given, but this time may vary with the seasons and locality, climate being the deciding factor. Fuerte in December, Puebla in January and February, Lyon in May, Blakeman in May and June, Spinks in March and April, Taft in May, Sharpless in May and Dickinson in June. Mr. Chace explained that some of these fat determinations were slightly but unavoidably interfered with and may be somewhat modified in one or two varieties before the close of another season.

An analysis of Mr. Chace's tables shows the Dickinson to be sixth in weight, eighth or lowest in per cent of pulp, highest in per cent of skin, third heaviest in seed, sixth in amount of protein and far the lowest in fat, having but 14.45 per cent as against 29.93 per cent in the Fuerte.

The first four cars of Valencia oranges of the season left the San Dimas-Charter Oak section on May 13, bound for England and Holland on the steamer Noerdyck.

Australia has prohibited importation of "pip" fruits, including apples, pears and quinces.

PREVENT SPREAD OF PHYLLOXERA

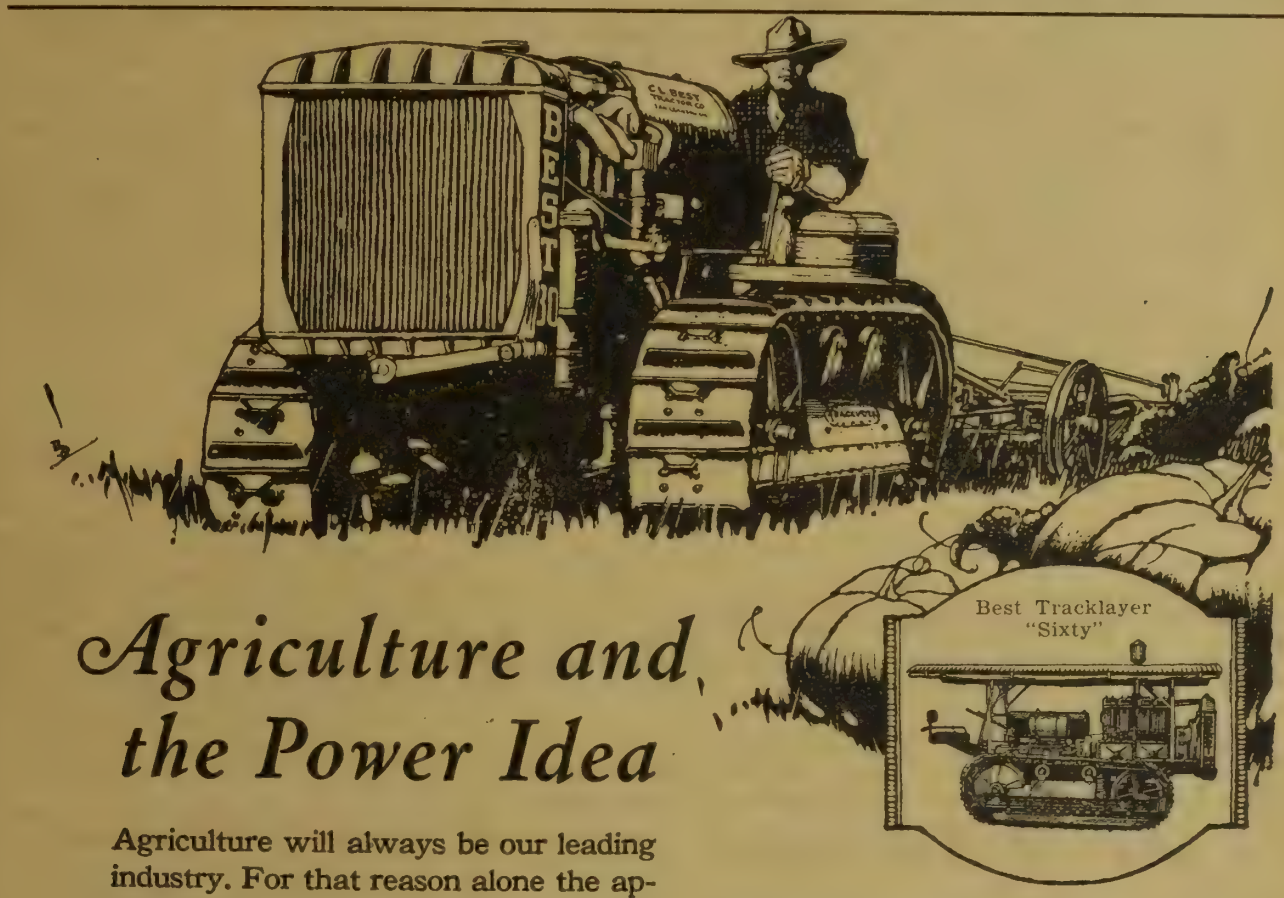
QUARANTINE against the importation of grape vines and protective measures for their inspection and fumigation are recommended by specialists of the United States department of agriculture as means of preventing the spread of the grape phylloxera in California. An extensive study of the life history of the insect has been made by specialists of the department, a report of which was recently published in Department Bulletin 903, "The Grape Phylloxera in California."

The methods recommended are in force in a number of sections in the California grape district. The grape phylloxera, according to the bulletin, is a native of the Mississippi Valley and made its appearance on the Pacific Coast among cultivated grapes planted about the missions as early as 1858. It has spread throughout most of the grape districts in the state and has caused such serious damage that many vineyards have had to be replanted two and three times. Though it is difficult to determine the loss caused by this pest estimates place the destruction at about 75,000 acres of grapes during the last 60 years.

First Appears in Spots

Phylloxera may be present in a vineyard several years before it causes the death of the vines. It first appears in spots, one or two vines showing a slight shortening of the canes and premature yellowing of the leaves, although the latter symptom may be caused by red spider or by alkali in the soil. The spot increases in size, the vines in the center become stunted and die, and finally the vineyard may be totally destroyed. Vineyards frequently have phylloxera spots of more than 20 years standing, but some vines still live.

The insect is destructive principally to the roots. More than 99 per cent of them pass the winter as small brownish, unmolted larvae, all parts of the root system being used for hibernating quarters. Coincident with the first sap flow in early spring is the growth of the hibernants, but the earliest individuals begin to grow fully



Agriculture and the Power Idea

Agriculture will always be our leading industry. For that reason alone the application of mechanical power to its operations in greater degree, is inevitable. Economic changes are forcing it.

All other industries have been forced to adopt the mechanical-power idea, and advancement has been in proportion to the development of machinery to speed up operations, multiply productive effort, lower costs and relieve man and beast of their burdens.

Agriculture itself must advance as other industries advance, because all industries are dependent on agriculture.

It is now clearly evident that lowering of crop-production costs is the prime essential. Greater application of mechanical power is the answer here as in other industries.

One of the greatest aids in lowering costs in a GOOD tractor—the right kind of tractor. A tractor cuts many corners in crop costs. Plowing and other field work can be done rapidly—24 hours per day if necessary—and done more thoroughly and efficiently. Every advantage of weather can be utilized for better yields, there is a saving in time, labor and hired help.

The right tractor will perform faithfully and economically. Such a machine should have more power than is required; should be more than ordinarily well built; should be just a little better and more substantial than seems necessary. Such a machine is the right one. It represents the true idea of all successful industrial mechanical power—real worth, built to meet fully all the requirements in its field.

Best Tracklayer Tractors have earned a splendid reputation for faithful service at low cost, for dependability, for power, for stamina. For years farmers have been depending on Best Tracklayer Tractors for better farming at lower costs.

Let us help you in applying mechanical power to your farming operations. Write for catalogs and full information and the name of our nearest dealer.

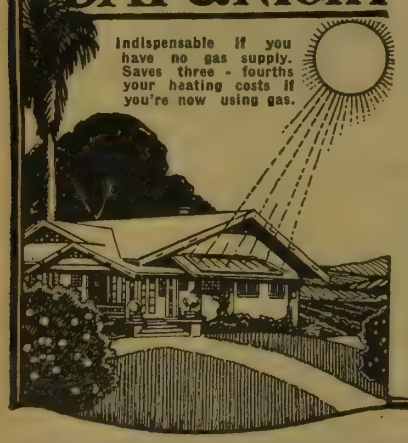
Let the SUN give you plenty of HOT WATER

DAY & NIGHT



SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept., E.

six weeks before the most tardy ones, so that after the foliage has opened hibernating larvae are still to be found on the roots. The first generation are matured in from four to seven weeks after the eggs have been deposited, and they in turn deposit eggs which produce other generations throughout the summer and autumn.

Vines growing in a well drained, very loose, and friable, sandy soil, or one with a surface of blow sand several inches in depth, seem to be almost immune to the attack of phylloxera. As the soil becomes heavier in texture and of poorer drainage, the vine succumbs more readily to the attack of the insect. Vines live longer in rich, deep, well drained soil. They diminish in quantity and quality when drainage is poor or on hillside soils lacking moisture. Excessive moisture instead of benefiting injured roots causes them to rot and hastens the death of the vine. Vines attacked when young and before their root systems have been established will succumb more rapidly than will those infested at a greater age.

The pest is easily introduced by planting infested rooted vines. It is also carried and spread by wind, running water, implements and picking boxes.

NICOTINE DUST FOR GRAPE LEAF HOPPER

(Continued from page 671.)

their beaks, or probosces, into the tissues of the plant and extracting the juices. For this reason the use of poison sprays is not an effective method of controlling this particular insect since it is possible for it to get its food from the vine without taking a particle of any poisonous substance into its stomach.

The insect is usually very plentiful during the early fall as the grapes are reaching maturity, when they appear in such numbers that they sometimes cause almost complete defoliation of the vines. At least a part of these insects winter over on grass, weeds, etc., which can usually be found along fence rows, ditch banks and waste places about the ranch. These overwintering adults transfer their attention to the new shoots on the vines as soon as the green appears in spring and after a short period of feeding eggs are deposited on the leaves and give rise to what is known as the first brood. These do some damage and soon give way to the second brood, which is the brood first mentioned as appearing in the early fall.

It has been considered impossible to effectively control the over-wintering adult winged hoppers before egg laying starts in the spring because of the failure of sprays used coming in actual contact with these active insects, but with the development of the nicotine dust preparations, which are effective in the control of aphids and other soft bodied insects, it was felt that here was a possible solution to the leaf hopper problem.

Due to weather conditions during the past winter, which seems to have been particularly favorable to the overwintering adults, considerable damage was done to the new tender growth in all parts of the San Joaquin Valley, and the indications were that the attacks of this insect would be more severe than ever before in the history of grape growing in California. Recognizing that something must be done to perfect a cheap, efficient method of combating this pest, the growers service department of the California Associated Raisin Company planned a series of tests with various dusting materials for the control of the adult hopper. Professor Ralph E. Smith, formerly of the University of California, who has had probably more experience than any other one man in the state in making and using dusting materials, was secured to assist in this work. Dusts carrying as high as ten per cent Black Leaf "40" in various combinations were used, but in all cases it was found that the insects were so active as to prevent satisfactory contact by these materials. Where the proper contact could be secured dusts containing five per cent and more Black Leaf "40" were found to actually kill the insect. For this reason it is believed that the commercial application of dusting materials for the control of the adult hoppers would be both expensive and ineffective.

The control of the wingless nymph hoppers is an entirely different question and the grape growers can use the proper dust mixtures with every assurance that they can kill a satisfactory percentage cheaply and effectively. The recommended materials for this purpose should contain at least five per cent Black Leaf "40," and, since the dust is to be used, the addition of from 60 to 75 per cent sublimed sulphur will also help to solve the mildew problem. This material when properly made can be used in the ordinary sulphur dusting machines. The application should be made in such a manner that the dust is directed upward into the vines because the young insects are found on the under surfaces of the leaves. The young hoppers began hatching the first of May in the Fresno district, so the growers should begin careful observation of their vines at once and determine for themselves whether or not the majority of the insects have hatched and when as few as possible have reached the winged stage. It is possible in the worst infestations that two dustings will be necessary to catch all of the individuals of this first brood. The success of dusting, like spraying, depends on the thoroughness of the application, and as labor costs more than material sufficient should be used to insure the desired results.

Dusting 'em Good and Plenty

A group of growers watching dust experiments with both hand and power machines for the control of grape leaf hopper.

PROCESSING FRUITS FOR EXHIBITION

THE beautiful fruits in glass jars seen in exhibit rooms and at fairs and expositions are remarkably natural and are definite proof of the producing power of any section. We are often asked for information as to this process and hesitate somewhat to give formulas for the big factor is experience. However, here are suggestions originally given out by the Ventura County farm bureau and printed in the California Cultivator Vol LIII, page 199:

Where it is desired to keep fresh fruit and vegetables for exhibit purposes, they are sometimes coated with a thin transparent water proof layer, which prevents evaporation of the moisture inside. A successful casing for this purpose can be made by mixing, while heated, one part of tallow, two parts beeswax and two parts paraffin oil. Apply in liquid state with brush or cloth or by immersing the sample in the liquid.

When coating pumpkins, squashes and other products with rough, thick rinds, add one-half ounce of gum arabic to the quart of mixture. A preparation known as parawax is satisfactory when there is only a small surface to cover. Two or three

coatings of the above mixture may be necessary, depending upon the amount of handling and exposure.

Where it is desired to preserve some especially fine specimens of fruit and where it is not desired to use them for food after exhibition, they may be preserved in various kinds of antiseptic fluids.

Select the finest specimens of fruit, both as to form and size. Handle them carefully to avoid all bruising, and place them in bottles, arranging them so as to show them to the best advantage. Fill each bottle to the neck with fruit, then pour on the fluid recommended, filling the bottles to within one-half inch of the stopper, so as to entirely cover the fruit; then place the stopper in the bottle and run a little melted beeswax or paraffin over the joint to make it air tight. Tie the stopper down with a strong piece of cotton, and attach to each bottle a label containing the following particulars: Name of the variety of fruit, name and address of grower. Write also in each case in one corner of the label the fluid which has been used. Wrap the bottles in paper to exclude the light and preserve in a cellar or other cool place until required for exhibit. Strawberries and raspberries should be cut from the plants or bushes with a pair of scissors, leaving a short piece of stem attached to each.

Formalin

For red currants, red or black cherries, red or black gooseberries, red or black grapes, dark colored plums, strawberries.

Formalin (Formaldehyde) one pound (16 ounces); water, 21 quarts; alcohol, five pints.

Allow the mixture to stand, and should there be any sediment, pour off the clear liquid and filter the remainder through filter paper.

This two per cent solution of formalin, or formaldehyde, has been found very useful for preserving strawberries, so as to give them a natural appearance.

In each case where this fluid is used, mark "F" on one corner of the label.

Boric Acid

For red apples, blackberries, black currants, red raspberries, black raspberries.

A solution of boric acid in the proportion of two per cent.

Dissolve one pound of boric (boracic) acid in 22 quarts of water, agitate until dissolved, then add five pints of alcohol. If the fluid is not clear, allow it to stand and settle, when the clear upper portion may be poured off and the remainder filtered.

In each case where this fluid is used, mark "B" on one corner of label.

Zinc Chloride

For green or russet apples, russet pears.

A solution of zinc chloride in the proportion of 3 per cent.

Dissolve one pound of zinc chloride in seven quarts of water, agitate until dissolved, then add one and two-thirds pints alcohol. Allow the mixture to stand until settled; then pour off the clear liquid and filter the remainder.

In each case where this fluid is used, mark "Z" on one corner of label.

Sulphurous Acid

For white or yellow apples, apricots, white cherries, white currants, green or yellow grapes, nectarines, peaches, green or yellow plums, quinces, white raspberries, green or yellow pears.

Sulphurous acid, one pint; water, eight pints; alcohol, one pint.

Allow the mixture to stand, and should there be any sediment, pour off the clear liquid and filter the remainder.

In each case where this fluid is used, mark "S" on one corner of label.

CROP REPORTS

Beginning with the issue of April 16 the Cultivator has quoted from letters from all parts of California showing fruit crop conditions. Some of the very first estimates have been very materially changed by abnormal weather. These changes have called for corrections on the part of some of those who made earlier estimates. Plainly not only in California but all over the United States there will be a fruit crop materially smaller than that of last year. A few of the more cautious have awaited the present issue to give their final estimates as follows:

Winters Dried Fruit Company, Yolo County

Almonds: 40 per cent; average, Nonpareil 25 per cent, Drakes 25 per cent, IXL 50 per cent, Ne Plus Ultra 50 per cent, others 30 per cent.
Apples: None.
Apricots: 25 per cent.
Cherries: None.
Peaches: 35 per cent.
Pears: 50 per cent.
Prunes: 50 per cent.
Grapes: Shipping Tokays 25 per cent, wine 10 per cent.
Figs: 50 per cent.
Frost April 14-15 reduced all crops
Rainfall 23 inches. Trees look good.

O. E. Bremner, Horticultural Commissioner, Sonoma County

Apples, 75 per cent; apricots, 10 per cent; cherries, 50 per cent; peaches, 40 per cent; pears, 35 per cent; prunes, 50 per cent; grapes, 80 per cent.

Pajaro Valley

The Pajaronian of Watsonville reports: "From growers in this valley, who are in a position to know whereof they speak, we learn that the recent frosts hit the crop in this valley hard. Some shippers and packers estimate that the shipments this season will be little over 1,500 carloads instead of the 3,000 carloads, ordinarily expected. The effect of the recent frosts and north winds hit some orchards harder than others in this valley. All accounts agree that the San Juan road and railroad districts were hit hardest. Cherries suffered greatly, and it is questionable if the crop amounts to anything."

Sonoma County

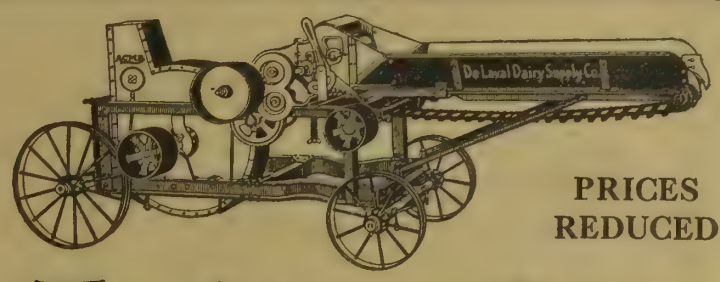
"In the Sebastopol district, which specializes on Gravensteins, an early maturing apple, usually warm weather following a freeze proved injurious, just as in the Pajaro Valley territory, the tender buds were scorched by the heat and consequently ruined. According to President Merritt of the Sebastopol Apple Growers' Association, the "drop" has been heavy, amounting to about 40 per cent. However, there is an increase in acreage this season and this may offset the loss."

STUDY SHIPMENTS VIA PANAMA

As a result of plans worked out in cooperation with the bureau of markets, United States department of agriculture, the Atlantic, Gulf and Pacific Steamship Company is now contemplating arrangements to equip the steamship Charles H. Cramp and adapt it to use as a practical laboratory in which the shipping of citrus fruits and apples from the Pacific Coast to Eastern markets by way of the Panama Canal can be studied.

Every possible effort will be made, it is said, to equip the ship with up-to-date apparatus for the thorough study of the problems arising from this method of transportation. The cargo space will be divided into different compartments, in which various sets of conditions can be produced and controlled. It will also be possible to make records under various transit conditions. Some factors that enter into the transportation of fruits and vegetables through the canal are temperature, ventilation, humidity, and other air conditions. Various degrees of ventilation and refrigeration will be studied.

Oranges, lemons and apples will be the principal fruits to be transported in the Charles H. Cramp, which will operate between the Pacific and Atlantic coasts while the tests are being made. Several of the American steamship lines are interested in the economical fitting out of ships to engage in the transportation of perishable fruits and vegetables by way of the canal to Atlantic Coast ports and to Europe.



PRICES REDUCED

The ACME Cutter

When Quality Silage, Durability and a Light Running Cutter is Desired Dairymen prefer the Acme

THE acknowledged superiority of the cylinder type cutter is universal—makes a better silage—chops every piece short and clean—packs it tight—avoids spoilage—and does the job in quickest time.

With this point settled, the question is—which of the cylinder types should you buy?

Compare the Acme point for point with all the others. That's what we did before we offered a cutter to the Dairymen of the Pacific Coast. Our experience and judgment selected the Acme.

It accomplishes quickly and with minimum power consumption everything you expect of a feed cutter, but it possesses many advantages not found in other machines.

Look at its frame construction—all steel. The blower, the knives, the feed rollers and the driving gears are rigidly mounted on this strongly braced foundation. Vibration, the arch enemy of all machinery, is guarded against at every vital point.

The cutter shaft is provided with three bearings and runs as true as the shaft of an electric motor. The bearings, securely bolted to the steel frame, stay in alignment and are subjected only to natural wear.

The result is, the Acme is a smooth, light running machine that will stand up to the work of feed cutting, season after season.

The Acme is a Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine

Protection for Agricultural Products

By Secretary of Agriculture Henry C. Wallace

DURING the next six months we shall either consciously or unconsciously lay the foundation for a national policy. What we do during this period is very likely to determine in a large way whether we shall make ourselves a "self sustaining, independent, self reliant nation agriculturally, industrially and politically," as President Harding expressed it in one of his speeches, or "whether we shall continue to exploit our agricultural resources for the benefit of our industrial and commercial life." Present troubles are greatly aggravated by unprecedented conditions both at home and abroad. Nations which used to buy most of our surplus, paying us in goods which did not seriously interfere with our own enterprises, are in bad condition financially. They owe huge sums of money to us and to their own people. They need all the money they can raise to rebuild their own industries. They are making desperate efforts to grow their own food, consequently they are buying as little as possible from us and are trying to sell us as much as possible. They want to send us goods to meet their payments of interest and principal and to pay for what they now buy. They must follow this policy; their salvation depends upon it. They will compete with our industries both in our own markets and in other markets which can use the sort of goods they produce.

Our own manufacturers see the danger to them in this situation. They see competition becoming more and more severe. Naturally and properly they are laying plans to meet it in every way they can. They want a tariff which will give them protection against cheap foreign goods. They want to cheapen their own cost of production in every way possible and, therefore, are anxious to keep down the price of food products and raw materials. Further than that, our own manufacturers will be wanting to extend their foreign markets as far as possible, especially during this period of financial stress at home. If they can send shiploads of their manufactured goods to the great food producing countries to the south of us and bring back these ships loaded with food products produced on cheap land and with the cheapest of labor, that would seem to them to be good business. But if we look at the interests of the nation as a whole and, indeed, if we take the long view of the future welfare of our great industrial and manufacturing regions, such a policy will be very bad, indeed. What we might gain through temporary enlargement of our foreign markets for manufactured goods will be lost, and much more with it, through the lessened buying power of our own producing population.

Take the case of the farmer at the present time. Last year he produced large crops of all kinds at the highest cost ever known. The fading away of the foreign outlet for his surplus, together with other causes, has resulted in a decrease in the price of the farmers' products until many of them are now selling for less than half the actual cost of production. In the face of this situation, foreign products are coming in. In times past we would be inclined to say that our great surplus and low prices are in themselves sufficient protection against foreign competition.

We cannot say that now because we seem to be one of the very few nations of the earth which has money and credit and can buy. Take the case of wool which furnishes the most easily understood illustration. We now have stored up enough wool to last us a year and a half, or possibly two years. The prices for wool are far below cost of production. Notwithstanding this, huge quantities of foreign wool still are being brought in and added to our surplus, simply because we have the money to pay. Some of it is passing through to foreign countries, stopping here just long enough to have our credit applied to it. As a result the sheep industry of the United States is facing ruin and its intimate connection with the banking and other enterprises of the great range country means trouble all along the line.

But this is simply illustrative of what is happening to producers generally. The cotton growers, the rice growers, the tobacco growers, the grain and livestock farmers, the dairymen, the cattlemen in the range country, the producers of fruit, all are being compelled to take prices below the cost of production. Prices are depressed not alone because of inactive business conditions at home, but because of the importations of competing foreign products.

It is this situation which must be considered when we take up the matter of the tariff, whether it be the emergency tariff or the permanent tariff. This nation cannot afford to permit the breaking down of its own agriculture, even if for a time we can buy food and other farm products cheaper from some one else. Just now we have a great surplus because of large crops and reduced consumption both at home and abroad, but this condition will not continue. Before the war consumption was rapidly overtaking production. Our population is growing. We cannot under any circumstances afford to permit the present discouraging conditions to continue and result in greatly decreased production, because that decreased production may mean exorbitantly high prices within a few years.

We have not considered, as we must, the heavy additional burden imposed upon producers by the increased freight rates and the large increase in other marketing charges. These increased rates are a differential imposed upon our own producers and to the benefit of our foreign competitors. Take corn, for example. The freight rate on corn from Omaha to Chicago is now 5.32 cents greater than it was in 1913, an increase of 86 per cent; and from Chicago to New York the freight rate is almost 23 cents per bushel. The Argentine corn grower can lay his corn down on our Eastern coast for about a third of the shipping cost imposed upon our own Western corn grower. It is true that imports have not been large, but every cargo of Argentine corn which reaches our coast is used to depress prices of our corn out of all proportion to the amount shipped in.

The increased freight and other marketing charges on wheat are practically the same as on corn, and are of even more importance on wheat because of the larger amount exported.

The freight rate on cotton from Memphis, Tennessee, to New York is 192 per cent greater than in 1913.

Freight rates on livestock from the producing sections to the consuming centers of the East are very nearly double what they were before the war.

The same burden has been imposed on potatoes, rice, tobacco, fruits and all other farm products which move to the industrial centers.

Practically all agricultural products should at once be given adequate protection against foreign competition. There is some talk of reestablishing the old import duties on farm products. In many cases those duties, if added, would not equal the extra cost of marketing. To any rates which may be levied now should be added an amount equal to the extra freight charges in getting products to the consuming centers.

The sooner we get down to studying this whole national situation, the better it is going to be for all of us. It is even more important to the industrial sections that our agriculture be put upon a thoroughly sound foundation than it is to the farmers themselves.

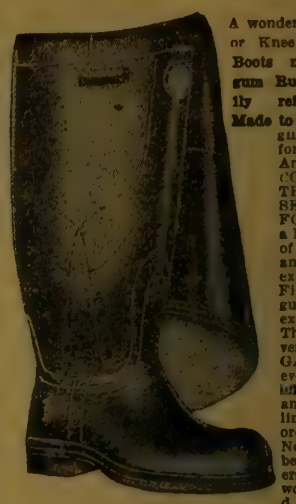
Rubber Boots For Ranchers and Irrigation Work

$3.98



A wonderful value in Hip or Knee Length Rubber Boots made of REAL gum Rubber with heavily reinforced seams. Made to order of the English Government for the British Army at actual COST OF MORE THAN WE ARE SELLING THEM FOR. Will stand all extremes of heat and cold and made to give extra long wear. Finest quality pure gum rubber with extra heavy soles. This is one of the very finest BARGAINS we have ever been able to offer our customers and the stock is limited so get your order in very early. Nothing better can be worn by ranchers or men who work in irrigated districts, rice fields, etc. This quality of Hip rubber boot would usually cost you $7.50 to $8.00. Remember you can get the full HIP boots for $3.98 or the shorter knee length boots for $3.29. Be sure to mark which kind you want on the coupon below. WE DO NOT WANT YOUR MONEY IN ADVANCE. We take all risk because these boots are such wonderful values. Fill out coupon NOW and mail at once if you want some of these boots before they are sold out.

Send for free catalogue of shoes for men, women, boys, girls and children.

Secretary of Commerce Hoover has suggested the creation of a national food commission.

FUTURE OF CALIFORNIA BEAN GROWERS

CALIFORNIA Bean Growers are making a fight for increased membership, and regarding the present opportunity and necessity the California Bean Growers Journal says editorially:

"The future of the California Bean Growers Association is up to the bean growers of the state. It is for them to say whether they desire the association to continue or whether they want to place themselves in the hands of those who have absolutely no interest whatever in the grower other than to secure the product of his labor at the lowest possible price. In short, the organized bean dealers, (and they have recently reorganized for their self-protection) are waiting for just this thing to happen. If it does happen the bean grower of California will have to take what is offered him for his crop, or leave it in the warehouse. There is going to be no other alternative. It is a good thing for the grower to remember that every time an independent buyer makes him a price it is considerably below the market value of the commodity. The buyer always plays safe at the expense of the producer. The buyer speculates on the labor and investment of the grower.

"Without an association of growers they are forced to accept whatever the buyer offers and have no means of knowing what the crop is worth. Without an association to watch the markets, keep the grower advised of conditions, get the highest average price throughout the season, handle his crop from the time it is harvested until the returns are in, make him advances at the beginning of the season, when he most needs it, he is going to be at the mercy of those interests. This is said without any animus whatever to any person or group of persons. It is a plain statement of facts.

"It is to be admitted that the benefits of the association have not been all that was expected. Conditions over which no man or any association had any control have brought this about. These conditions are known to every bean grower. It should, however, be borne in mind that it takes considerable time, even under the most advantageous conditions, for any association to function smoothly. There were many important questions to work out, policies to formulate, office and selling force to organize, representatives to be appointed in all of the selling centers in this country and abroad. These things have all been done; mistakes have been rectified; the office system and force reorganized, and an efficient selling department put into the field, comprising some 300 representatives situated in every selling center of the country. This has all taken time. Mistakes and errors of judgment were bound to occur. These have been corrected. In other words, the association is now in a position to give to the grower the service and benefits which were originally contemplated, at a minimum cost, which is the function of every cooperative association. There is not a grower who has not made some mistake in operating his ranch. He does not quit right then and there. On the contrary, he benefits by those mistakes. So it is with any business or any cooperative association.

"It has cost many thousands of dollars to bring the association to its present state of efficiency and the members have paid for it. Do you want to throw away the cost, the efforts and the experience of the past three years now that the association is ready to function profitably? There must of necessity be an association of bean growers for their own protection and a new association would only have to go through the same troubles and make some of the same mistakes and cost just as much, if not more.

The question is—do you want the association to continue? It is your association. If you do, sign the bean crop agreement, also signing and stating on the authorization slip under which plan or plans you desire your 1921 crop to be handled."

A big cowboys rodeo and barbecue will be held May 29 on the Tapo Alto Ranch, Santa Susanna, Ventura County.

COOPERATION IN COLORADO

COOPERATION has made 20 per cent better prices possible to the farmers of Colorado," is the statement in a resolution recently passed by the Colorado Vegetable Growers Association. This association, now about a year old, is not only prosperous, but picturesque. Its membership is composed for the most part of Japanese and Italian truck growers, many of whom do not speak English. But language difficulties have not proved a barrier to effective cooperation.

Declining prices and alleged unfair practices on the part of the local growers were the two principal reasons back of the organization of the Colorado vegetable growers. It was not simply a matter of a few disgruntled farmers with grievances—the whole neighborhood was aroused. Could nothing be done? Was there no court of appeal? Action was imperative. A community meeting was called and late one afternoon a self-appointed committee journeyed to Denver in search of assistance.

Foundations of Successful Cooperation

In broken English and with wild gesticulations the committee stated its case to the representative of the bureau of markets, United States department of agriculture. The agent in marketing suggested cooperation as a possible solution of the growers difficulties. He told them something of the principles of cooperation, how thousands of cooperative organizations had been formed during the past few years, how a number of these associations had achieved undreamed of success, but he cautioned them that there must be a distinct need for cooperation, that once the association was formed there must be a true spirit of cooperation among the growers, and that the organization must be efficiently managed or failure would result. The growers grasped eagerly at the idea. Enthusiasm effervesced in two languages.

That evening a large meeting of truck growers was held. The bureau of markets representative spoke in English and an interpreter translated the speech into Italian and Japanese. The excited auditors were soon discussing the pros and cons of cooperative marketing, its principles, and the rules and by-laws of cooperative organizations. It was voted almost unanimously to form a cooperative organization.

The next evening a representative committee of growers from the various producing sections met with the bureau's agent, who went into further details. Another open meeting was then held and the Colorado Vegetable Growers Association was formed. At the first meeting of the board of directors the agent discussed sound business practices, the importance of establishing and maintaining a practical system of accounting, and the adoption of suitable grades and inspection service on products shipped under the association name and brands.

Within a week the association was rolling shipments averaging five to six carloads daily. Some of the products went out in "mixed cars"; some in carlots. In little more than six months 173 carlot shipments had been handled, made up of 99,390 pounds of potatoes, 2,224,035 pounds of cabbage, 25,209 pounds of celery, and somewhat smaller quantities of parsnips, rutabagas, onions, carrots, beets, turnips, lettuce and cauliflower. The total value of these shipments was $30,000. The first year the association handled about 20 per cent of all shipments of mixed and bunched vegetables sent out from Denver and vicinity.

Why Cooperative Organizations Fail

Hundreds of cooperative organizations have gone to the wall because of the selfishness of individual members and their failure to cooperate in the true sense of the word. Others have failed through improper management. But here is a group of growers, not only of different nationalities, but unable in many instances to converse among themselves without the aid of an interpreter, who have been able to set aside the personal element for the purpose of contributing to the success of the organization as a whole. And they are attaining their end. The

94 L. & B. Pumps
Used on Capay Rancho

Approximately 8,500 acres comprising the well-known Capay Rancho in Glenn County, California, are irrigated with Layne & Bowler Turbine Centrifugal Pumps. These pumps were selected in competition with other makes and were given preference because the owners of the ranch considered them the most satisfactory in every respect and capable of giving dependable service year in and year out.

The above two views show two of the Layne & Bowler Pumps in action on the Capay Rancho. The Sacramento Valley Colony Company at Hamilton City, Montana Land Company at Hynes, Salinas Land Company at King City and the San Joaquin Fruit Company at Tustin have used L. & B. Pumps for many years.

members feel that the association has come to stay and that cooperation has solved some of their many problems.

Specialists of the bureau of markets who are studying the cooperative marketing question find that associations organized on a sound business basis and efficiently managed perform a highly satisfactory service. But before undertaking a cooperative venture growers should seek the advice of marketing experts qualified to determine the necessity for organizing, the particular kind of association that should be formed, and the business practices to be followed. Cooperative organization is playing such a large part in the distribution of farm products that the bureau of markets has a special division in which cooperation is being carefully studied, and the assistance and advice of the bureau's experts can be had by anyone upon request.

QUICK ACTION DEMANDED

According to those who are said to be well informed, approximately 65 per cent of last year's grain crop is still in the warehouses of the state and by July 1 another crop, variously estimated as being as large, if not larger, than that of last year, will be ready for shelter.

In view of this condition the Oakland chamber of commerce is making the necessary arrangements to provide a grain exchange which will feature the sale of bulk as well as sacked grain. It is conceded that more grain will be shipped in bulk this year than ever before.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

May Beetle

Bugs enclosed are not visible during the day but at night they are as thick as a swarm of bees and just have a feast on the flowers, buds and leaves of the rose bushes. We find some around the roots in the ground when we dig up the earth during the day but they seem to be lifeless until they realize they are out of the ground and then they try to fly away. They do not bother the roots, however. These enclosed were in a jar for five days and we found them still alive.—Subscriber.

This is the common May beetle or June bug which is an all round nuisance, devouring leaves of nearly all plants. It is especially fond of plum and apricot trees. The pest lasts but a short time, but if one desires to poison, four pounds of neutral lead arsenate in 50 gallons of water sprayed over the foliage is effective.

Rabbits With Sore Feet

Will you please tell me what to do for rabbit with sore feet?—Subscriber, Downey.

The usual cause of sore feet in rabbits is delay in cleaning hutches, the ammonia generated in the deposits causing the hock or sometimes the feet to become sore. Preventive measures should be taken such as thorough cleaning and thorough drying of the hutches. Carefully wash the feet and sore spots with a pure soap and perhaps mild disinfectant. Apply witch hazel followed by zinc ointment or carbolated vaseline. The floor of hutch may be covered with clean straw or litter, or better still, clean sawdust.

Moth Infested Fur

Will you please tell me how to treat moth infested fur and safely put away for the summer?—Subscriber, Downey.

Probably the best treatment for furs is to confine in gas tight box in which has been set shallow dish containing carbon bisulphide. The amount of carbon bisulphide needed in the box will be at the rate of one pound per 200 cubic feet. The temperature should be above 75 degrees Fahrenheit. Be sure and keep fire away from the gas of the bisulphide for it is explosive. After being left in this container with the gas for a few hours the fur should be stored where it is impossible for the moth to reach it, and in addition it may be protected by liberal use of moth balls. Cold storage is also resorted to in protecting furs.

Twig Borer

I am sending an olive twig, together with a bug now infesting my trees. Can you tell me the insect's name? What shall I do to destroy it?—Subscriber, Los Banos.

The remains of the insects were seriously mutilated in the mails. However, quite plainly they are the common branch and twig borer, the adult of which is a beetle, Polycaon confertus, with black or brown wing covers from three-eighths to five-eighths inch long. The eggs of this pest are laid on wood, usually at the axil of the leaf, and the larvae tunnel underneath the bark and in the tender young wood. There is no reaching them with sprays and control measures are so difficult that it is seldom control is attempted. So far as reported the damage has not been serious from this pest.

Processing Fruit for Exhibition

Some time ago you published formulas for preserving fruits fresh such as we see in real estate offices and chambers of commerce. The paper was destroyed and have been unable to get one and I wanted to fix some strawberries and blackberries for our fair this fall so wish you would send me the paper containing the formulas or reprint in an early paper as I would like very much to have them. We have taken the Cultivator for years and feel we can't get along without it. Have received lots of help from its columns.—Subscriber, Orland.

The entire article referred to will be found reprinted on another page.

Gnats

When, where and how do gnats breed? What do they live on when they can't find human beings? How can they be controlled?—Subscriber, Thermal.

As gnats are of little economic importance the literature on them is not very extended. The United States department of agriculture issued a bulletin on "Five Species of Simulium Found In the United States," but no suggestions are offered for control or extermination. They are dependent on running water for development, have no restricted climatic or geographic range, and feed on blood of animals. As they will not feed in captivity and their life is brief, little study has been made of them. Their most favored feeding place is within the ears of horses and mules; in far less proportion on cattle.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Right of Survivorship and Inheritance Tax

Man and wife own property under joint deed with right of survivorship. If either dies, must the survivor pay an inheritance tax? If so, how much? What exemption from inheritance tax is allowed in the case of a son?—Subscriber, Santa Ana.

In such cases, a proceeding is necessary to establish the fact of death of record and before the decree in such proceeding in entered, inheritance tax must be fully paid. The inheritance tax law provides that whenever property is held in joint names with right of survivorship, the right of the surviving joint tenant to the ownership of the property shall be deemed a transfer and taxable under the provisions of the act in the same manner as though the whole property to which such transfer relates belonged absolutely to the deceased joint tenant and had been devised to the surviving joint tenant by will, excepting therefrom such part as may be proved by the surviving joint tenant to have belonged to him and not to the decedent. The following exemptions from tax are allowed: Property of the clear value of $24,000 transferred to the widow or to a minor child of the decedent and of $10,000 in case of beneficial interest transferred to the husband's lineal ancestor or issue of the decedent. The tax upon the difference between such exemption and $25,000 is calculated at the rate of one per cent of the clear value of the interest. As to the cases over $25,000 up to $50,000, two per cent; as to the cases over $50,000 up to $100,000, four per cent; as to the cases over $100,000 up to $200,000, seven per cent, and so on in increasing amounts.

Pay for Services

A party subdivided 40 acres; sold some of the lots; then took the tract off the market. He appointed me to act as his agent in maintaining the pumping plant, supplying water to the lots sold, and to compensate me agreed that I could farm the unsold lots for a year. I sowed and harvested the crop. The next year nothing additional was said and I prepared the land for seed. Then the owner leased the land to a third party to crop. The third party and I made an agreement whereby I was to put in the crop and share the proceeds. Is the owner of the land relieved of obligation to me or am I entitled to payment for services rendered in operating pumping plant during the period of the second year before the new arrangement was made?—Subscriber.

The general rule is that when a lessee of property remains in possession

after the expiration of hiring and the lessor accepts rent from him, the parties are presumed to have resumed the hiring for the same period of time. As the lessor accepted rent from you in the way of services during the first five months, it appeared that you had the right to the lease of the land. If you voluntarily gave up that right, to a third party, it may appear that you gave up your right to payment and the whole claim was merged in the compromise which you made with the third party. There may be on the other hand circumstances which would entitle you to maintain an action for reasonable value of your services.

Use of Pipe Line

Two neighbors own a pipe line. Last year a third party planted five acres with no possible way of irrigating except through our line, which we permitted him to use for that season, but distinctly told him that he would have to find other means for irrigating for the present season. He still insists on using our line. If we forbid him further use, could he hold us for damages because his trees died from a lack of water? Could I prohibit the use of the line without the joinder of the other owner?—Subscriber, Duarte.

Unquestionably, if you gave the man a mere license for one year, he could thereby acquire no right for the succeeding year, as your property is your own to do with whatever you please and if his trees died it is his own fault, not yours. However, as the pipe line is jointly owned, it would undoubtedly be wise to have both owners join in this prohibition, as, if the permission were continued by one of the owners, it would doubtless entitle the man to procure his water.

Auto Contract

I bought an automobile on contract. When I failed to make payment, the owner takes the automobile, sells it at a sacrifice, and now wants me to pay the difference. Can he collect?—Subscriber, Pomona.

That would depend entirely upon the terms of the contract itself. Upon the ordinary conditional sale contract, if the vendor retakes the personal property described, he has exercised the option therein given and that is the extent of his right. Contracts are so drawn, however, which might permit such procedure as that which the vendor seems desirous of taking.

Probating—Torrens Title

In the case of real estate held under the Torrens act, the property being in the wife's name, when she died, leaving surviving a husband and no children, does the property pass to the surviving husband upon death? — Subscriber, Covina.

The Torrens act is a mere method of registration of titles and does not deal with the passing of titles. It would be necessary to take the ordinary probate procedure. The only modification this would have would be that a distinct statement is made in registration under the Torrens act as to whether the property is seperate or community property. That might have some effect upon the administration of the estate. In the given instance, it would be necessary to appoint an administrator, advertise for creditors, appraise the property, and eventually put in the final account and petition for distribution. The property standing in the wife's name, the presumption of law is that the property is her separate property, unless modified by the registration. In case it is her separate property, one-half goes to the husband and the remaining one-half of the estate would go to the next of kin of the wife.

Transferring Realty to Husband

Real estate is deeded to husband and wife with right of survivorship. In case she desires to give her husband full ownership, what is necessary?—Subscriber, Covina.

It is only necessary that she execute and deliver to the husband a deed for her interest in this property.

Inheritance

A husband dies without a will and without children. To whom does the property go? In case there were children, what share would the wife receive?—Subscriber, Covina.

In case the property is community property, the wife would first take one-half irrespective of children. Her interest in the separate property would be one-half in case there are no children and the remaining one-half would go to the next of kin of the husband, which half, in case there were one child, would go to the child. In case there are two or more children, the wife would receive one-third and the other two-thirds would be divided equally among the children or their descendents.

Inheritance by Husband

A wife dies—no children. Is the husband heir to her property? — Subscriber, Covina.

A husband is an heir to the separate property of the wife to the extent of one-half thereof, the remaining one-half going to the next of kin of the wife.

Fictitious Name of Firm

Is a firm operating under the name of "Smith Company" required to publish the names of all interested parties?—Subscriber, Covina.

Every partnership transacting business under a fictitious name or designation not showing the names of the persons interested as partners in such business must file with the county clerk a certificate stating the name in full and place of residence of each of the members thereof and such certificate must be published once a week for four weeks. The only penalty for failing so to do, however, is that such partnership is not permitted to maintain any action upon or on account of any contract or transaction had under the fictitious name until certificate has been filed and publication made. It has been held that any firm name which does not disclose the full names of the parties is a fictitious name under the provision of this rule.

Double the use of your car

Also ask about Reliance four-wheel Trailers

Do you make a practice of carrying small lots of merchandise in your auto? Why not accomplish the same results and relieve tires, springs and upholstery from wear and tear, depreciation and risk of overloading, by the use of a two-wheel trailer built for exactly this purpose?

You can double the use of your car at no extra expense for motive power. You can transport merchandise which perhaps now requires teams or trucks, such as fruit, live stock, etc. You can reach more distant and profitable markets with small quantities of perishable products.

Reliance two-wheel Trailers are scientifically designed for use behind autos and delivery cars. They are properly balanced, pull easily, are built of wrought steel—strong but light—will last a lifetime. Side stake pockets enable the use of any type body, quickly detachable.

ONE FLAG

By James Arthur

A reunited nation—
One flag, one hope, one soul,
One destiny for liberty,
One purpose and one goal—
In grateful recollection
Of those who welded fast
Her sundered bands, with outstretched hands
Gives blessings for the past;

Gives blessings for the soldiers
Who formed the battle's van
In "days that tried men's souls," who died
To save the rights of man,
Who kept aloft Old Glory,
Who made a race go free
And linked the land in one to stand
Through all the years to be.

Heap high their graves with garlands
Until they bloom as bright
As does the fame that writes each name
In lines of love and light,
And let the floral message
Our gratitude declare,
While the perfumes that bank their tombs
Breathe incense like a prayer.

If love were but a blossom
And thankfulness a wreath
The mountain high would reach the sky
These dead should sleep beneath,
Of if a nation's blessings
In music were expressed
The ages long would be a song
About their place of rest.

They saved the first republic
The centuries gave birth,
And that shall be a prophecy
Of one that belts the earth.
They died to lift from bondage
A race beneath the ban,
And that shall shine a deed divine
As long as man loves man.

WITH PUP'S ASSISTANCE

By G. RUSSELL

(Conclusion of story begun May 7.)

Then they talked of many things, finally approaching the subject of orange groves, when Martha said to her brother:

"Phil, Mr. Burnham is interested in orange groves, prospectively. I have been telling him something about the Peters grove. You tell him about it. Maybe he would like to buy it."

Phil laughed, embarrassed. "It's a bargain all right," he said "but Mr. Burnham is a day too late. I bought it myself today."

Martha looked at her brother, dumfounded. Visions of mortgages and sheriff's sales floated before her. But she only looked at him steadily while he continued: "I was over at Peters' place today, looking over the grove. It's a better grove than I had supposed, and not so badly run down. While I was there they had a telegram. Mrs. Peters' mother has had a stroke of paralysis. They had also just had a letter from their married daughter. Her husband has been in an automobile accident and is in the hospital. They are determined to go back at once and Mr. Peters made me a splendid offer. Said he'd be willing to wait for his money but he would rather we had it than anybody else as he knew he would get his money finally. It was such a good offer that I took him up. I know I can handle it, somehow. They are hoping to leave day after tomorrow. Suppose we all go and look it over—see what we have bought," and Phil laughed in a confident way that helped reassure Martha, though she was still somewhat dazed.

Phil showed them the grove with all the pride of ownership. After a somewhat thorough survey, Mr. Burnham said:

"It looks pretty good to me. What will you take for it?"

"Oh, well, I hadn't thought of selling so soon."

"Then it isn't for sale?"

"It might be, under some conditions," replied Phil. "At any rate, the two and a half acres next to our grove isn't for sale. I want that to go with our piece. Seven and a half acres is a good deal better size, for several reasons. But I'll tell you, Mr. Burnham, I wouldn't have risked buying it if I hadn't felt sure I could make a good thing out of it, and I wouldn't care to sell at anywhere near what I paid for it."

"What would you consider a good price for it, as it stands," persisted Mr. Burnham.

"Well," Phill considered, "if I were selling, I wouldn't care to take less than—twelve thousand for the seven and a half acres, including the house, which is a good one, though not very large. And, well, by George, if I were buying I wouldn't consider that an unreasonable price to pay for it."

"Do I understand that you would take twelve thousand for it?"

"Yes, and I admit I'd be doing well at that."

"All right, I'll take it."

Martha gasped. She turned to Frances Burnham. That lady looked calm. "Oh, you don't know my father. That's the way he does business."

"But isn't he likely to regret it," Martha asked.

"Hardly. He's had his heart set on an orange grove in Southern California for years. It looks sudden, but it really isn't so sudden. Of course the where is sudden, but the fact itself isn't."

They strolled back toward the little house, passing Pup, still digging for the gopher with undiminished enthusiasm.

"We must go, Frances," said her father. "It's getting late."

"Not until you have had supper," interposed Martha. And as they remonstrated she said, "If you knew what a treat it is for us to have company, you would know I wouldn't miss a perfectly good opportunity like this. Please don't refuse, and I'll promise to have supper ready in record time."

And sure enough, it was a remarkably short time until the supper bell called them in to a very simple but very appetizing supper. And afterward they visited around the table until George Burnham declared the police would be out after them if they didn't start. He expressed keen enjoyment of the day as he shook hands all around, his daughter following his example as they arranged to return the day after tomorrow and close up the deal for the orange grove. "I believe I have never enjoyed a day so much in my life," Frances said at parting. "I think I'll come back and steal Billy. We are good friends, aren't we, Billy?" and Billy responded inelegantly, "You bet.!"

As their car started down the road after the last good-bye had been waved, George Burnham whistled softly and meditatively. "And we find at the end of a perfect day the soul of a friend we've made."

"It's been just that, a perfect day, hasn't it, Father?" mused Frances.

"That's just what I was thinking," he replied.

"And whistling it, too," she laughed.

And back at the little house, as they stood watching the automobile down the road, Phil was humming "And we find at the end of a perfect day, the soul of a friend we've made." "It has been a perfect day, hasn't it, Father?" said Martha. "Indeed it has," he conceded with unusual warmth, and then:

"I tell you, Martha, I like that George Burnham."

"I'm glad you do, Father, for I'm going to marry him." The three stared at her aghast. Martha laughed. "Oh, he doesn't know it yet."

Phil snorted. "Anybody with half an eye could see he was right willing."

"That's encouraging," said Martha. "And isn't Frances pretty, and isn't she nice."

"Do you think so,' coolly responded her brother. "Well, I'm glad you do, Martha, for I'm going to marry her."

"Well!" exploded his sister.

"Oh, she doesn't know it yet, but I'm going to marry her just the same. Billy, here, has already made a tremendous hit with her, and it's a pity if Billy's father can't do as well when he finds a good opportunity."

Martha smiled. "Anybody with half an eye could see that you would be able to persuade her without tremendous effort. She hardly took her eyes off of you except when she was watching Billy."

And just then Pup came bounding into their midst, a gopher held in a vise-like grip in his jaws, his whole delighted body wagging his satisfaction as he waited for their approval, which was not slow in coming.

"Papa, I know what he's thinking," said Billy.

"Well, what, Billy?"

"He's thinking "This is the end of a perfect day."

The Cultivator Patterns

3598. Child's Dress.—Cut in 3 sizes: 2, 4, and 6 years. A 4 year size will require 3⅛ yards of 27 inch material. Price 10 cents.

3616. Ladies' Dress.—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5⅝ yards of 44 inch material. The width of the skirt at the foot is 2¼ yards. Price 10 cents.

3594. Girl's Dress.—Cut in 4 sizes: 8, 10, 12 and 14 years. A 10 year size will require 3½ yards of 40 inch material. Price 10 cents.

3617. Ladies' House Dress.—Cut in 7 sizes 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 6½ yards of 27 inch material. The width of the skirt at the foot is about 2 yards. Price 10 cents.

3601. Boy's Suit.—Cut in 4 sizes: 2, 3, 4 and 5 years. A 4 year size will require 1⅝ yard of 24 inch material for the blouse and 3 yards for the trousers. Price 10 cents.

3599-3606. A Smart Costume.—Blouse 3599 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires 3 yards of 36 inch material for a 38 inch size. Skirt 3606 is cut in 5 sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. A 28 inch size will require 3 yards of 44 inch material if cut crosswise, and 2½ yards if cut lengthwise of the goods. The width of the skirt at the foot is about 3 yards. Two separate patterns, 10 cents for each pattern.

3595. Girl's Bloomer Dress.—Cut in 4 sizes: 4, 6, 8 and 10 years. An 8 year size will require 2¾ yards of 32 inch material for the dress in bloomer style. With plain skirt it will require 2⅝ yards. Price 10 cents.

3110. Apron and Cap.—Cut in 4 sizes: small, 32-34; medium, 36-38; large, 40-42; and extra large, 44-46 inches bust measure. Size medium requires 3¼ yards for the apron and ⅞ yards for the cap, of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

HOUSEHOLD QUERIES

Smoking and Curing Fish

Can you give me information through your columns as to smoking and curing of fish?—Subscriber, Santa Ana.

We are sending this inquirer copy of the Cultivator of October 16, 1920, which contained directions for curing fish and constructing smoke house.

Lemon and Orange Syrup

Would you please reprint the recipe for canning syrup made from lemons. It was printed about four weeks ago. I saved the paper and later it was misplaced.—Subscriber, Reedley.

This is the one given by Mrs. Temple in the Cultivator of March 26:

"Three or four lemons and enough orange juice to fill a quart jar, with about a half cup of sugar, brought to a boil, then sealed in a glass jar, will keep indefinitely. This juice, with a double amount of water, is one of our most delicious drinks."

Recipes Wanted

Would someone please give me a good recipe for muffins made with sour milk? Also a recipe for fig cookies like those you buy. I have tried many of the recipes given in the Cultivator and found them all good.—Subscriber, Oakdale.

For recipes printed in answer to his request the Cultivator will be glad to give subscription credit. With your recipe be sure to send name and address of one to whom you wish paper sent.

Sour milk, we think, makes the very best muffins. There is an almost infinite variety of combinations. Here is a good one, using white and graham flour: One and one-fourth cups sour milk, 2 tablespoons shortening, 1 teaspoon soda, 1 teaspoon salt. Mix to thoroughly blend, then add 1 cup white flour, 1½ cups graham flour, 2 teaspoons baking powder. Beat to thoroughly mix. Bake 18 minutes in well greased muffin pans. But go slow on the soda. If the milk is only slightly sour a "pinch" of soda will neutralize the acid and you may then use only the usual amount of baking powder. This is a case where the experienced cook says: "Just use your judgment." The cook who uses pasteurized milk adds very little soda required. However, the field is open to favorite and tried recipes. Send them in.

LIFE NOT A GAME OF CARDS

The utter accuracy of the universe is appalling. . . . Even music can be mathematically expressed. A Mozart sonata is governed absolutely by the law of numbers. And if all these things are under the rigid rule of exact law, why are not the things of the mind and heart and soul governed also by the same exactness? . . . It is no mere figure of speech, then, to say, "Be sure your sins will find you out."

"Whatsoever a man soweth, that shall he also reap." Also, your goodness will find you out. . . . The Ten Commandments do not foozle any more than does the multiplication table. Once get this conviction deep in our mind, it ought not to alarm us but to give us a great and unshakable peace. For it gives us the feeling that our destiny is not the plaything of chance but the result of a precise and intelligent purpose. . . . Few people actually take as their working creed the moral and spiritual acruracy of the universe. They admit the rule in physics and astronomy and in the lawyer's office, but in their human relations they persist in the suspicion that life is rather a game of cards, part luck and part shrewdness. Whoever will renounce this superstition acknowledges once for all that justice and mercy are as reliable as the rule of three.—Current Opinion.

WHAT THRIFT IS

I am peace of mind.

I am stored up contentment.

I am freedom from worry and fear.

I am common sense applied to living.

I am discipline in youth and rest in old age.

I contribute to health, efficiency and confidence. I am the enemy of the "rainy day" dread, the foe of want.

I put people in a position to take advantage of their opportunities.

I am better than a health resort and more soothing than a needed vacation.

I mean better opportunities for your children and a position of respect in your community.

I am a builder of civilization and I sustain and preserve the best interests of a nation.

I increase the confidence of young men and enable them to mount on the ladder of success.

THE SOUP HABIT

There are habits to be avoided, and habits to be cultivated. Among the latter is the soup habit. It is not only economical, using all the odd tablespoonfuls of vegetables and meat left on the serving dishes, which are too small to make other use of, but it is a most appetizing as well as nourishing form of food. Many people have an idea that soup, like the ancient bit of history regarding Gaul, which was one of our first lessons in Latin, is "divided into three parts," vegetables, beef and potato. They have not learned of the infinite variety which can be given by the addition of various vegetables and herbs.

THE IDEAL DIET

In an ideal diet as much should be expended for fruits and vegetables together as for bread and cereals, and more than is spent for meat, butter and other fats. The only article of diet for which one is justified in spending more is milk. Apples supply necessary minerals, aid in preventing acidiosis, scurvy and constipation, improve the sanitary condition of the bowels, and promote the growth of children. It has been demonstrated that the antiscorbutic vitamine contained in apples is an essential for normal growth.

MARSHMALLOW FUDGE

Use one-quarter pound of fresh marshmallows, three cups confectioner's sugar, three-quarters cup cream, one square cooking chocolate, one teaspoon vanilla extract and one tablespoon butter. With sharp scissors cut the marshmallows into small pieces. Butter the pan into which the candy is to be poured. Boil together the sugar, the cream and the chocolate until a little of the mixture will form a soft ball when dropped into cold water. Remove it from the hot part of the stove, add the butter and the vanilla, and beat into it the pieces of marshmallows. Pour the mixture out before it becomes too thick. If desired chopped nuts also may be mixed in—one-half cup for the quantity of fudge that this recipe will make.

AVOCADO PIE

This comes from Florida:

"Everyone thinks of the avocado as a salad fruit, but really—have you ever eaten an avocado pie? Take a good fruit or fruits, according to size. Just tell the cook lady to make it like pumpkin or sweet potato pie. The combination is guaranteed to make an avocado enthusiast."

THE POEM THAT WILL LIVE

Snakespeare did a little writing
That the race is still reciting;
Milton, too, did some inditing
That we do not think of slighting.
Chaucer did a little singing,
Spencer's phrases still are ringing,
Byron's stuff some praise is bringing,
Wordsworth's flights continue winging,
Burns' poems keep on going,
Shelley's work still life is showing,
Keats' numbers still are flowing,
Tennyson we still are knowing.
When these facts as does the ember
All the world will still remember
"Thirty days hath September,
April, June and November."
—McLandburg Wilson.

When saving for your old age, don't neglect to lay up a few pleasant thoughts.—Life.

Ask for Ghirardelli's Ground Chocolate at the store where you do your trading. Never sold in bulk but in cans only. In this way Ghirardelli's retains its flavor and strength—the two most important elements of good chocolate.

IT'S simple enough—the chocolate-sweetness of Ghirardelli's makes additional sugar unnecessary. You lose nothing of its deliciousness, its flavor, its strength, when you "pass up" the sugar. For Ghirardelli's "stands on its own feet" as a complete food beverage—sufficient unto itself!

Rhodes Grass

A Good Pasture that will Grow on Alkali Soil

RHODES GRASS SHOWING RUNNERS AND METHODS OF SPREADING

Gus Nellen of Imperial Valley has about 8½ acres in Rhodes on which he has kept 20 milk cows, also some hogs, and has about 12 tons hay left from the last year. His place was covered with Bermuda so he just broadcasted the Rhodes Grass Seed and turned the water in slowly and kept the place moist and before long the Rhodes had the Bermuda choked out. Another advantage is that he can keep the cattle on it while irrigating, for it isn't hurt by being trampled on, for wherever the runners are trampled into the ground, they start to grow.

He also recommends it highly for hog pasture as they like it very much, and do well on it.

$2,300 Top at Victory Sale

A general average of $302 marked the dispersal of the Victory herd of Holsteins at Hillcrest Ranch, Caruthers, May 11. The sale was made to close the partnership that has existed between H. E. Spires and J. M. Crawford, but it has been announced that each of the former owners expect to re-engage in the business individually. The feature of the sale was the selling of the cow Norma Korndyke Cornucopia that recently completed a seven day record of 38.40 pounds of butter from 666.20 pounds of milk. She was purchased by a syndicate consisting of Walter Donders, J. M. Blinkiron and J. P. Phillips, all of Fresno, for $2,300. Her yearling daughter, Victory Lady Cornucopia, sold to I. M. Morrison of Laton for $1,000. Mr. Morrison is a new man to become interested in Holsteins and secured a dozen of the better sorts. Another new puchaser was L. Rusconi of Fresno, who paid $1,725 for the splendid young bull, King Pontiac Alcartra Prilly, a son of the famous Bridgford sire and show bull, King Segis Alcartra Prilly. Mr. Rusconi was also a strong bidder of the young females, securing a nice lot for a foundation. Berylwood Stock Farm, Hueneme, selected three head of females. Frank Helm of Fresno purchased the 27 pound three year old Lady Korndyke Hengerveld for $650 and Harry Paulson of San Joaquin paid $510 for her two year old daughter. Ralph C. Blowers of Hanford got a rare bargain when he paid $125 for the herd bull Sir Piebe De Kol Pontiac.

The 22 cows averaged $501, 27 heifers and heifer calves $221 and the 18 bulls, many of them quite young, averaged $183.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company. Col. Ben A. Rhoades of Los Angeles, assisted by Col. Geo. W. Bell of Tulare, were the auctioneers.

A representative list of sales follow:

BULLS

1. Sir Piebe De Kol Segis Pontiac, Feb. 1914; Ralph C. Blowers, Hanford, $125.
2. King Pontiac Alcartra Prilly, Mar. 1919; L. Rusconi, Fresno, $1,725.
3½. Bull calf out of Norma Korndyke Cornucopia, Carl L. Lewis, Riverdale, $400.

FEMALES

3. Norma Korndyke Cornucopia, May 1915, 38.40 lbs.; Walter Donders, J. M. Blinkiron, J. P. Phillips, Fresno, $2,300.
4. Victory Lady Cornucopia, April 1920; I. M. Morrison, Laton, $1,000.
7. Dottie Korndyke Segis, April 1915; I. M. Morrison, $350.
8. Victory Josephine Segis Pontiac, Sept. 1917, 15.32 lbs., 2 yrs.; I. M. Morrison, $650.
9. Victory Willea Bess, Sept. 1917, 15.47 lbs., 2 yrs.; I. M. Morrison, $650.
11. Douwe Burke, Jan. 1917, 13.88 lbs., 3 yrs.; E. A. Thurber, Fresno, $185.
13. Korndyke Canary Brightest, Feb. 1916; Berylwood Stock Farm, Hueneme, $700.
14. Leila Korndyke Hengerveld, April 1916, 27.01 lbs., 3½ yrs.; Frank Helm, Fresno, $650.
15. Victory Lorna Korndyke, Mar. 1919, 12.57 lbs., 22 months; Harry Paulson, San Joaquin, $510.
18. Miss Clara Pietertje Ormsby, April 1919; I. M. Morrison, $500.
19. Dora Hamilton Korndyke, June 1916, 22.42 lbs., 4½ yrs.; I. M. Morrison, $300.
20. Victory Dorothy Korndyke, Feb. 1920; L. Rusconi, $200.
22. Marchmont, Mar. 1915, 17.30 lbs., 5 yrs.; D. Carmignani, Dos Palos, $325.
24. Roquette Paula Daughter, April 1918; J. M. Blinkiron, Fresno, $200.
25. Gelsche Walker Korndyke 2d, Sept. 1917; Berylwood Stock Farm, $300.
27. Korndyke Shadeland Gerben, Jan. 1918; Alan Milnes, Riverdale, $220.
29. Fancy Marie Pontiac Sprague, Feb. 1915; Berylwood Stock Farm, $275.
30. Victory Fancy, Sept. 1919; I. M. Morrison, $250.
31. Eldorado Beryl, Feb. 1918, 15.71 lbs., 2 yrs.; I. M. Morrison, $525.
33. Victory Diamond Pel, Jan. 1919; L. Rusconi, $400.
35. Victory Pel Pontiac, Dec. 1919; L. Rusconi, $300.
37. Victory Calamity Jane, Feb. 1919, 12.33 lbs., 2 yrs.; I. M. Morrison, $385.
41. Victory Deal Inez, Nov. 1919; L. Rusconi, $300.
44. Victory Joan Pontiac, April 1920; I. M. Morrison, $200.
47. Victory Segis Piebe, Dec. 1918, 15.56 lbs., 2 yrs.; I. M. Morrison, $400.
49. Victory Pontiac Salome, Jan. 1918, 15.49 lbs.; L. Rusconi, $410.
51. Victory De Kol Mary Pontiac, Oct. 1917, 16.85 lbs.; Frank Helm, $325.
52. Victory Calamity Burr Pontiac, July 1918, 12.72 lbs., 2 yrs.; L. Rusconi, $435.
53. Hedgerow Posch De Kol, April 1915; E. A. Thurber, $210.
55. Jessie Segis It, Dec. 1916; Harry Paulson, $560.
56. Blooming Success, April 1919; L. Rusconi, $210.
58. Maud De Kol Eva Burke, April 1919; I. M. Morrison, $325.
59. Laton Segis, Aug. 1919; I. M. Morrison, $200.
60. Daughter of Tagus Pauline De Kol, July 1919; L. Rusconi, $200.

Three Beef Cattle Sales Next Week

The three beef cattle sales scheduled for the Sacramento territory next week can be taken as an indication of the growth of the pure bred beef cattle industry in this state during the last few years. Only a comparatively short time ago a single sale of registered beef cattle was rather a novelty, but during the last two years it has been possible for sellers to arrange sale circuits. Next week, however, will see the first Shorthorn circuit inaugurated when the Caledonia Farms, West Sacramento, will sell on Wednesday, to be followed by Howard Vaughn's initial sale at Dixon the next day.

The forthcoming sale from the Caledonia herd will be the third public offering from that establishment in 12 months. The three sales have been possible owing to the fact that this is one of the largest herds in the West. As the herd is at present it represents three distinct herds merged into one. First of all it includes the famous Howard Cattle Company cattle, a herd that was one of the pioneers in this state. Later the Harkness and Elmendorf herds of Kentucky were added. This herd is distinguished as the home of three very high class herd bulls. Imp. Caledonia, from whence comes the farm name, was purchased two years ago from Frank W. Harding, secretary of the American Shorthorn Breeders Association. It is of interest to western breeders to know that this bull is rated as one of the most valuable bulls imported in recent years. In several Eastern sales calves sired by Caledonia have sold for an average above $1,500. In the last Anoka sale Caledonia calves averaged $2,470 and one sold for $6,250. Caledonia Farms has many of his calves and all are of remarkable type and quality. Gainford Matchless, grand champion at the 1919 San Francisco show, is also in service in the herd and proving highly satisfactory as a sire. The third herd bull is Pine Grove King, the oldest of the trio, and a sire of marked ability. It should mean much to the future of the Shorthorn breed in this state to have the blood of such notable sires made available to all. The Shorthorn industry in this state is growing very rapidly and many new herds have been established, but many more are needed.

Howard Vaughn, who is making his first public sale in this state, is a former Iowa breeder and at one time was secretary of the Iowa state association. Vaughn has been literally raised among Shorthorns, his father and his grandfather before him being breeders. He is a graduate of the Iowa State Agricultural College. Vaughn moved to California last year and purchased a highly improved ranch just north of Dixon. He has listed 32 head, 16 bulls and 16 females, for his sale.

Following the last named sale the Finnell Stock Farms, Galt, will disperse their entire herd of Herefords. This firm is one of the new breeding establishments in this state, having been organized but a little over a year ago. At that time it was planned to develop an extensive herd, but their plans have been changed and it is now proposed to devote most of the ranch to fruit and grape culture. Accordingly the cattle holding will be closed out. Included in the sale will be all the cattle the owners selected as their private breeding herd from the large purchase made last year from the Kiesel Land and Cattle Company of Oregon.

There seems to be every reason to expect a wide expansion of the beef cattle industry in California in the years to come. This state is a natural cattle country without a superior and as the problem of production costs grows cattlemen are turning more and more to registered bulls to increase

the efficiency of their herds. It has been estimated that this state requires eight to ten thousand bulls a year to care for our range business. That fact alone would seem to make for a wide and stable market for all time to come.

REFUND TO WOOL GROWERS

A new record of distributing refunded excess profits on the 1918 wool clip was made by the bureau of markets, United States department of agriculture, during the week ending April 16, when 11,645 checks, representing $53,188.06, were mailed out to growers. The total number of refund checks which were mailed out to that date was 54,492, distributing excess profits amounting to $185,463.66.

The distribution of refunds was begun last October. Distribution for the week ending April 16 covered one-fifth of the total number of checks and one-fourth of the total amount of money returned to growers that far. The record made during that week, however, was due to an accumulation of checks received from the disbursing office and the special effort made to bring the work up to date.

Up to this time $568,116.54 has been received from wool dealers as excess profits to be distributed to the growers. The pending excess profits cases involve an additional minimum amount of $581,600.27, which will make the total refund from wool dealers $1,149,716.18. This represents the excess profits thus far ascertained and demanded from 68 central dealers and 953 country dealers. Reports submitted by wool dealers indicate that only 38 per cent of the central dealers and 20 per cent of the country dealers made excess profits on their 1918 transactions.

What the Future Holds for Dairymen

By J. E. Dorman during Livestock Week at Davis

THERE may be men who can say what the future holds for dairymen but I frankly confess that I cannot to any great extent although I am inclined to be very optimistic. However, it may not be so difficult to predict what may take place if certain lines of work are carried out. The dairymen themselves will determine the future of the dairy industry, whatever it may be, but I will say this, as long as there is a government of the United States there will be a dairy industry.

Mr. Hoover says, "The white race cannot exist without dairy products and we will be compelled to support the dairy industry." The situation today, we must admit, is somewhat unsettled, yet there is nothing that should alarm us if conditions were anything like normal.

We are not as dependent on foreign trade to take our surplus as some may think. While exports have fallen off very materially during the past year, yet our export trade has never been so extensive that if it was entirely withdrawn it would bring disaster to the industry.

The condensed milk situation has caused some concern in some districts, yet only five per cent of our product is manufactured into condensed milk. Prior to the war we exported 20 million pounds yearly. During the war period exports amounted at times to as high as 115 million pounds monthly. Exports now are considerably above the normal amount. While the closing of some of the condenseries has placed more butter and cheese on the market, yet reports indicate that the amount in storage is less now than at this time last year.

While the imports of butter have had some influence on prices, there should be no great concern. The greater part of our imported butter comes from Denmark. At the present time it is coming at the rate of two million pounds per month. We consume about 4½ million pounds per day. With just a little effort on the part of our dairymen to improve the quality of our butter this amount of imported butter would not make the least disturbance on the market. This increased consumption of dairy products is one of the greatest problems before the dairymen today and it must be done if the industry is to make progress. It is marvelous what can be done in this connection.

I was talking to a professional man a few days ago and he said: "Our family ordinarily uses one pound of butter a week, but I happened to get some butter from a local creamery last week that was made from fresh, sweet cream and it was so delicious that we used three pounds during the week." Think what that would mean if the same thing happened in all of the families in the United States—the demand for three times the amount now used. The same increase could be made in the consumption of cheese. It will take advertising of dairy products and quality to back it up.

When Dr. McCollum discovered vitamines in dairy products it gave the dairy industry advertising material that no other product in the world ever had. The dairy councils, state and national, are making use of it, and when the work is fully organized and supported the dairy council will be a powerful influence in the marketing problems of the industry.

We are almost at the bottom of the list of nations in consumption of dairy products. Sweden consumes 69 gallons of milk per capita, the United States, 42 gallons; Australia consumes 27 pounds of butter per capita, the United States 16½ pounds; Switzerland uses 36½ pounds of cheese per capita, the United States 3 pounds.

The problem of the market for dairy products does not lie beyond the seas; it is here in our own country and the solution is better quality, increased consumption and economy in production.

Economy in production is not the least of these, for prices must be reasonable in order to increase consumption. Whatever can be done to reduce the cost of production will help to increase consumption. This is the problem of the producer.

Scientists are at work on problems that may result in changes that we do not even dream of today. What do we know about the inside of a cow? Very little. Two cows may look alike in conformation, in size and quality, eat the same amount of feed and yet one will produce several times as much butterfat as the other. Will this difference in their ability ever be discovered? Perhaps.

Dr. Meigs of the bureau of animal industry believes that he has found a difference in the ability of cows to store up from their feed enough of certain elements necessary for maximum milk production to last through a lactation period. One of these elements is phosphorus. He has been feeding phosphorus in the form of sodium phosphate to a number of cows for some time, and while it is still in the experimental stage he has announced that it was possible to obtain an increase of from 20 to 30 per cent in milk production. This indicates that we may expect some discoveries within the next few years that may decidedly lower the cost of production.

In this connection I might briefly mention other feeding problems. In the examination of the production records of over 10,000 cows it has been found that the size of the cow has a direct relation to her production. The large cows of every breed are decidedly ahead of the small cows of the same breed, not only in the production of milk and butterfat but in the income over cost of feed. This is true for every breed and every age of every breed. The records of one breed of grade cows will illustrate what was found to be true in all other dairy breeds:

	Small	Med.	Large
Pounds milk	5865	7037	7890
Butterfat	226	259	280
Income over feed cost	$68	$79	$84

Of course, there are exceptions to this rule, and while size seems to be an important factor, size alone is not enough to guarantee production, and no high producing cow should be condemned because she lacks size. However, the ten highest producers of milk and the ten highest producers of butterfat in each of the four leading dairy breeds averaged 260 pounds in weight above the breed averages given in Farmers Bulletin No. 893 of the United States department of agriculture. Of these 80 cows, two were of average size, one was below the average weight and 77 were above the average breed weight.

This opens up the question of raising big cows. I believe there is a general feeling of dairy men to underestimate the value of properly feeding calves. Milk costs something, and where labor is scarce calves are not given the attention that they should have to develop into large cows, yet when handled so that they will develop into cows above the average in size they stand a very good chance to produce from 40 to 60 pounds of butterfat per year more than the small sized cows.

I might bring up many other matters relating to production, but in my opinion the real problem of the dairy business today is the poor milk and cream problem. In no other line of industry would a business man go to the expense of manufacturing an article and then allow it to deteriorate before reaching the market. Carelessness on the part of the dairymen in this respect has caused the failure of more creameries than any other cause. Quality should be the aim of every manufacturer of food products because it has been found that such goods will sell better and as a rule consumption will be increased. Good butter and cheese can be made only if the raw material is good. The producer is responsible for the quality of the raw material and therefore for the quality of the finished product. It costs just as much to produce butterfat whether it reaches the market in good or poor condition.

One of our men assisted a cooperative creamery in changing from sour cream to a sweet cream supply. Before the change this creamery was content to sell its butter for from five to 15 cents below top quotations. Now their butter retails at ten cents above the regular run of creamery butter in the local markets in the Intermountain states. It will mean an additional income of about $50,000 annually to the patrons of this creamery.

The producers and manufacturers of dairy products everywhere are beginning to realize that quality is becoming the greatest marketing factor known. Consumers are demanding quality, and those who wish to get the most from their labors must produce quality.

Everything points to a safe, steady growth of the dairy industry, but every precaution should be observed to prepare for unfavorable conditions. If hard times fail to materialize the industry will be in much better condition by having taken such precautions. For years we have realized that we owe a duty to the consuming public, the necessity for improvement in the quality of our products.

The future of the industry will be just what we make it. It is in the hands of the dairymen themselves. Let us cooperate with all agencies interested for a common purpose to make the dairy industry the greatest and cleanest industry of our country.

Richard Sale, Tehama County's noted barley grower, has planted a small acreage in rows 30 inches apart and plants four inches apart. Some roots now have fifty stalks.

Orange County has a new 560 acre seed farm, now being planted to peppers, beans, melons and general garden fruits and vegetables.

Anaheim will hold a bond election to pass on $50,000 worth of bonds to be used for various city improvements.

MARKETING DATA

The California Cattlemen's Association has a marketing committee composed of Fred H. Bixby, Long Beach, chairman; C. N. Hawkins, Hollister; A. S. Goode, Bakersfield!; James Barry, Cottonwood, and Owen Duffy, Napa. This committee meets every two weeks in the state office, 224 Sharon Building, San Francisco, to review the feed and market situation, not only in California but the 12 western states. The recommendations of this committee are sent to the members of this association. There are something like 8,500 cattlemen in California at the present time, though only about 2,000 of them belong to the association.

The reports of the committee are to be supplied to the California Cultivator and will be given as promptly as possible after released by the committee. High points from the first report indicate:

Grass conditions in parts of San Diego County, Kern County, Santa Barbara County, Fresno County and San Luis Obispo County below normal; in central and northern parts exceptionally good.

Fat cattle in Southern California at least 50 per cent shortage; Central California at least 25 per cent shortage; Northern California normal. There will be no surplus beef this year. The average monthly consumption is approximately 41,000 head.

Beef supply in Texas 40 per cent shortage; Arizona—feed very short, necessitating shipping out 100,000 head of feeder steers, a large percentage to Montana; Wyoming 50 per cent shortage; Montana 60 per cent shortage; Idaho 25 per cent to 40 per cent shortage; Oregon 25 per cent shortage.

Advices from outside markets north and east point conclusively to higher prices in the immediate future. This will enable California to ship out beef cattle if it is found advisable.

Lamb advanced three cents in San Francisco today.

A meeting with the Los Angeles packers was held Thursday, April 14. Eight packers were represented, including Mr. Hardy of San Diego.

A meeting of the San Francisco and Oakland packers was held April 25. Five packers were represented.

The consensus of opinion is that the cattlemen of the state will be paid 7 cents for cows and 8½ for steers, when cattle are located within a $5 freight rate, if they stick.

Consignment of cattle: Very few cattle are being sent in to be killed on commission. Never send in cattle on consignment. Sell your cattle f. o. b. ranch or shipping point. As an example, look at the lamb situation for the past month. Consignments from foxtail areas arriving in San Francisco daily and price dropping to almost nothing, shipments have stopped, price goes up 3 cents in one day. Last week steers were sold in Imperial at 8 cents f. o. b. cars. Last week 6½ cents was offered for cows near Gilroy f. o. b. cars. This offer was refused by the owner.

DISPERSAL SALE

98 REGISTERED HEREFORDS

62 FEMALES—36 BULLS

Finnell Stock Farm Co., Galt, Sacramento County Cal.

Friday, May 27, at 10 A.M.

When Finnell Stock Farm Company purchased the entire herd of 180 registered Herefords from Kiesel Land & Cattle Co. early in 1920, the plan was to develop a large herd of high quality, but the owners have recently decided to make extensive planting of vineyards and orchards, making the sale of the cattle necessary.
Shortly after this herd was purchased, the owners prevailed upon Alex McDonald, the noted herdsman at University Farm, to visit the herd and select from the 180 head the females they should retain as breeding material in the number they wished to carry. This was done and afterward the tops of the remainder were sold at public auction in November, 1920. The offering in this sale thus represents the very tops of the entire original herd, and they are Herefords of unusual usefulness as breeding material.

29 COWS WITH CALVES AT FOOT

This group contains a most desirable lot of young cows, the calves at foot being sired by Beau Blanchard 37th, son of Engle's great Beau Blanchard, and by Sir Thomas, the numbers by each sire about equally divided.

33 BULLS FOR THE RANGE

These bulls are sired by Beau Blanchard 37th and Sir Thomas, out of some of the very best cows in the herd. Eight of them are 1920 calves, all except one past a year old, and the other 25 are of 1919 calving, practically all senior yearlings with a few 2 year olds. They have been raised on the range, which is true of the entire herd, and are ready to go right out into service.

33 BRED COWS AND BRED AND OPEN HEIFERS

This group presents a most attractive appearance for purchase, including young cows of real worth and a considerable number of heifers by Sir Thomas and Beau Blanchard 37th.

3 HERD BULLS

Beau Blanchard 37th and Sir Thomas have a large number of sons and daughters in the sale, which easily prove their worth as sires. The third herd bull to sell is without question one of the very best bred Hereford bulls ever sold in the west, the noted Gudgell & Simpson bred bull Cardinal, sired by the famous bull Domino and out of Capitola 34th, a daughter of Beau Modesto, second dam by Dandy Rex, third dam by Beau Brummel.

A STAR LOT The sale list includes a daughter of Cazier's Harris Standard 2nd, selling with a fine heifer calf at foot by Cazier's $10,000.00 Beau Blanchard 76th.

TERMS OF SALE: The owners are prepared to extend unusually liberal terms to responsible parties. Such arrangements must be made before sale, otherwise terms are cash. Applications for credit may now be made either in person or by letter to FINNELL STOCK FARM CO., Galt, Calif.

Every animal sold as a single lot, except range bulls, guaranteed breeders; everything over six months old tuberculin tested.

FINNELL STOCK FARM is about eight miles east of Galt, about 35 miles southeast of Sacramento.

SALE OPENS PROMPTLY AT 10 A.M.

First Spring Sale

32 Registered Shorthorns 32

16 FEMALES—16 BULLS

MOUNTAIN VIEW HERD OWNED BY HOWARD VAUGHN DIXON, CAL.

Thursday, May 26, at 1 P.M.

This is the first individual public sale from this well known herd since its removal from Iowa to California, and for this offering Mr. Vaughn has selected a class of cattle that he depends upon to make a favorable impression in his initial sale in California.

Scotch and Scotch Top Females and Bulls

In the sale list will be found a number of individuals representing the most popular tribes of Scotch breeding, as well as American sorts of approved breeding and substantial individuality.

The females include cows with calves at foot, and bred and open heifers, among them some of outstanding worth and the balance rated as most useful breeding material.

THE BULLS are especially attractive, including individuals that may well be given consideration as herd headers, with a splendid selection for the range man, big, well grown, rugged bulls raised under range conditions and ready for heavy service.

TUBERCULIN TESTED—GUARANTEED BREEDERS

TERMS OF SALE: One-half cash, balance in six months on approved notes at 8 per cent, but terms are cash unless credit arrangements are made before sale. Applications for credit may be made any time between now and opening of sale to the sale managers.

MOUNTAIN VIEW HERD is located on the main State Highway one and one-half miles north of Dixon, Calif. HEADQUARTERS OF SALE will be Travelers Hotel, Sacramento, from which point transportation to sale will be provided to those coming in by train morning of sale.

MORE ANIMALS

By George H. Hecke, Director of Agriculture

We have reached that point in our agricultural history at which we must allot to its two cardinal divisions, plant industry and animal industry, a like support and encouragement in order to realize a coordinated and perfect machine. Such encouragement and support do not call for inordinate, unlimited demands from the state or from the people but rather a well ordered, well deserved support and aid commensurate with contemparary needs. An increase in a given budget as bienniums mature should be accepted as a logical result of normal, healthy progress and in nowise indicative of unreasonable demands or inordinate expense.

Heretofore an ample demonstration and proper representations have secured for California plant industry at least sufficient aid to show progressive development, and now with the critical needs of the times calling for such added assistance that animal industry may give to the plant industry we of California must marshall our resources and promote her animal industry when it is shown that such measures are timely and necessary.

HOW TO OVERCOME FAILURE OF SWINE TO REPRODUCE

Failure in the ability or desire of swine to reproduce may be caused by any of several conditions. It may result from a disease or injury that seriously affects or destroys the secretory reproductive organs. It may be caused by improper functioning of the system, which in turn is often brought about by unsuitable feed or faulty elimination of waste products, or it may be due to a general lowering of body vitality.

There are also cases of sterility or impotence for which definite causes are difficult to find. Failure to breed quite frequently occurs in boars and sows which have been fitted and kept in high condition for show purposes. In some instances the sow fails to come in heat, or perhaps indicates that she is in heat and is successfully served by the boar without resulting conception. In other cases the boar shows no desire to mate or acts ineffectively.

Make Examination to Find Cause

The first step in overcoming the trouble is to find a positive cause, when possible, by making a thorough examination. This should include a search for physical defects, the presence of disease, the results of injuries, or lowered vitality from any cause.

When, from such examination, it appears that proper treatment will prove successful, remedies should be administered promptly. But if the cause is obscure or if there is little likelihood of correcting the defect successfully, it is best to remove the animal from the breeding herd. Boars may be castrated and fitted for slaughter as market hogs. Similarly, sows should be discarded when they become uncertain breeders.

At the recent wool sales in London certain German buyers were observed to use the sense of hearing, in addition to those of touch and sight, when examining wool. If one holds a handful of wool close to the ear and draws out a staple, the noise so caused in a dry fleece is really surprising. In very greasy wools—New Zealand, for example—there is scarcely any sound at all. It only remains for some enterprising buyer to taste the wool!—Wool Record.

Essentials of Animal Breeding

By Geo. M. Rommel, Chief Animal Husbandry Division

(Conclusion of article in Cultivator April 23, 30 and May 14.)

A breeder's success depends to a very large extent on his ability as a qualified judge of animals, on his knowledge of the pedigrees of his animals, and on his acquaintance with the characteristics of the ancestors of those animals. The breeder's ability as a judge must be based on an instinctive gift to recognize animal types and carry them clearly in mind. This is of even more importance than a knowledge of pedigrees, because a knowledge of pedigrees is of practical value only as it gives its possessor an acquaintance with the individuality and type of the ancestors in the pedigrees, which he may use in making effective matings and thus perfecting the type of his animals. One of our most eminent breeders of hogs once made the statement, "I breed my hogs in the barnyard, with the animals before me, not in my parlor with their pedigrees before me." That homely statement carries a truth which every ambitious young breeder should follow. Before deciding to make a certain mating, the man who made this statement is said to spend hours studying his breeding animals, going over their characteristics, and especially recalling to mind the characteristics of their parents, grandparents and more remote ancestors. If this review is satisfactory, the mating is made; if not, some other is tried.

To sum up, knowledge of a pedigree must not stop with the routine knowledge of the names of the animals which compose it. The breeder must know also the characteristics of these animals, as far back as possible, their weaknesses as well as their strong points. When he possesses this information the breeder can more intelligently mate individuals and blend blood lines. He has then a practical working knowledge of pedigrees. The study of pedigrees, therefore, based on a knowledge of the characteristics of the animals composing them, is indispensable to the man who would excel as a constructive breeder.

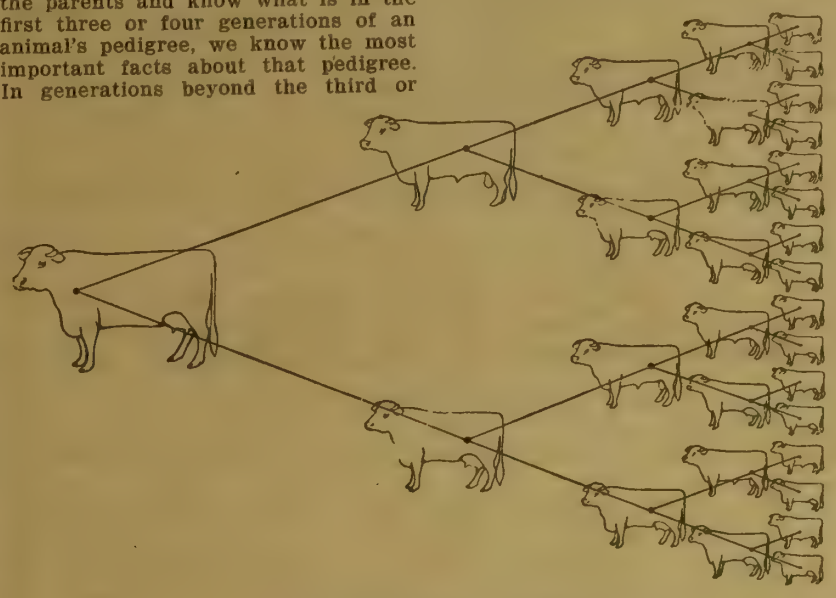
Value of a Pedigree

No one breeds animals without dealing with pedigrees. The common phrase "pedigree stock," as a synonym of "well bred" or "pure bred" in describing livestock, is a misnomer. All plants, all animals, all people have pedigrees, but all information about these pedigrees is not available. Pedigrees become known because of merit in some individual which stands out above his fellows. His progeny are watched, and if they have merit above the average they are "saved for breeding purposes," and by and by we have a line of known descent and ultimately perhaps a pedigree of distinction and formidable appearance. They are written into genealogies, herd books, flock books, and stud books, and the inheritance of decades and even of centuries becomes in time a matter of written record.

The proof of the value of the pedigree is the worth of the animals it produces. The value of animals with certain pedigrees depends upon their ability to produce desirable types with greater excellence and uniformity than animals with other pedigrees or with no known pedigrees whatever. The power of the animal with a known pedigree to reproduce its type has been intensified by selection. Therefore, if the matings which have been made in constructing the pedigree have not been directed by a high order of skillful selection, the animal may have intensified powers of producing an undesirable type, and may be what is commonly designated a "scrub pure bred." The purchase of an animal or its use for breeding purposes solely on account of its pedigree is a dangerous matter and may result in much more harm than good.

What is the most important part of the pedigree? Usually only the ancestors which are "close up" are those which are of practical importance in determining the identity of the individual. Assuming that Mendel's law governs animal inheritance, we may occasionally expect to find an off type occurring, but by the repeated culling out of such types the frequency of their occurrence is being constantly reduced. Therefore, if we are sure of the parents and know what is in the first three or four generations of an animal's pedigree, we know the most important facts about that pedigree. In generations beyond the third or fourth the influence of any ancestor is so slight that for practical purposes it may be ignored.

In a four generation pedigree there are 30 ancestors, all of which may be different individuals. Usually in pedigrees of most pure bred herds there are fewer than 30 separate individuals, depending on the amount of inbreeding in the pedigree. The chart shows this fact graphically. Suppose there is no inbreeding in a four generation pedigree, the chance that one of the animals in the fourth generation will dominate the pedigree above all others is very small indeed. The chart thus shows graphically the relative importance of the respective ancestors for four generations. Each figure in the chart is just half the size of the one in the generation preceding, and this conforms fairly well to the standard formula of inheritance. The chance of grandparents' dominating the inheritance of the mating can not be more, and is undoubtedly much less, than one in six; the chance of a great grandparent is less than one in 14; and the chance of a great great grandparent (fourth generation) is less than one in 30, provided no inbreeding occurs. In a pedigree covering ten generations (which can easily be run out with almost any of our well established breeds of domestic animals) there are 2,046 ancestors, more than half of which are in the tenth generation. Yet cattle are sometimes sold at a premium because a certain cow appears in the pedigree as far back as the tenth generation or even farther, regardless of the merit of animals much farther down in the pedigree. Or a pedigree may be classed as unfashionable and the animal carrying it may be discriminated against, regardless of its individual excellence, because some unpopular animal may have appeared in an extremely remote generation.



The Main Points of a Pedigree

A graphic representation of the relative importance of ancestors in the first four generations. Families in livestock often trace their foundation to a single animal which may not be reached within ten generations. It is quite as important to know what sort of animals make up the later matings as it is to know to what family the animal belongs. The proof of the value of a pedigree is the worth of the animals it produces.

The Texas Sheep and Goat Raisers Association is considering cancelling its June show at Del Rio, Texas, and joining with the Northwest goat interests in the Portland show in November.

Why the De Laval Milker Increases production

The De Laval Milker is based on two fundamental principles that govern the milking of a cow for greatest production:

(1) **85% of a cow's milk is made during milking time.**

(2) **Unless milking is pleasing to a cow, the greatest amount of milk will not be made.**

The organs of a cow which make milk are so sensitive, and the milk is made in such a short time, that the way milking is done greatly influences the production.

The De Laval Milker operates in a manner most pleasing to a cow and therefore the organs which make milk are stimulated to greatest production. Its action is gentle, uniform, cannot be changed, and anyone can operate it. The fact that it usually increases production over hand milking, is the best evidence that it pleases the cow.

The extra milk your cows will give and the saving in time will soon pay for a De Laval Milker. It is a better way of milking. Write for complete information.

Herefords
May 27, Finnell Stock Farms, Galt.

The Jersey cow, Marigold of Ferndale, owned by J. W. Coppini of Ferndale, has recently completed a Class AAA Register of Merit record of 511.10 pounds fat from 8,866 pounds milk in 350 days.

E. W. Doane of Merced has been making some very creditable Register of Merit records with his Jerseys. Lorna's Dorothy, starting her test at the age of one year and 11 months, made 272.8 pounds of fat from 4,337 pounds of milk in 316 days; Effie Richie, three years and 11 months, produced 584.28 pounds of fat from 9,266 pounds of milk in 365 days; Fern's Interested Bessie, an aged cow, made 537.50 pounds of fat from 10,209 pounds of milk in 309 days.

George V. Kirkwood of Pasadena has recently purchased ten Aberdeen Angus heifers and a bull from Congdon & Battles, Yakima, Washington. The above purchase represents foundation material for another Doddie herd in California.

W. M. Carruthers of Live Oak, writing under recent date says: "I am in receipt of a letter from W. S. Short of Nevada, who purchased several Shorthorn heifers from my consignment in the association's spring sale at Davis, stating that they have all passed the 60 day retest for tuberculosis and that he expects soon to have his herd on the accredited herd list."

Financier's Peggy, a Jersey owned by Grant A. Brown of El Monte, has completed a Class A Register of Merit record started at the age of one year and ten months. In 365 days she produced 391.37 pounds of fat from 6,831 pounds of milk.

The American Hampshire Swine Record Association reports having recorded 22,000 more pedigrees during the first four months of 1921 than during the same period last year. The association states that over 1,200 persons have bought their first registered Hampshire since January 1.

Dr. W. J. Fitts of Gallatin, Tennessee, and Ortell Lininger of Fairfax, Missouri, have been chosen by a committee of representatives from the National and American Duroc Association to judge Durocs at the 1921 National Swine Show. Both men are experienced Duroc breeders.

Volume 105 of the American Shorthorn Herd Book is off the press and ready for distribution. It contains pedigrees of animals calved before May 26, 1920, numbers running from 877,001 to 907,000, inclusive.

Volume 31 of the Holstein-Friesian Blue Book is now available for distribution and may be obtained from Secretary M. H. Gardner of the Holstein Advanced Registry, Delavan, Wisconsin.

The National Swine Growers Association has launched a monthly publication called "The Hogman." The subscription list is limited to members of the association.

Dr. H. G. Gross, prominent Jersey breeder of Eureka, has placed his cow, Inez Raleigh, in Class AAA of the Register of Merit with 399.81 pounds fat from 7,329 pounds milk to her credit.

A newspaper report tells of a cow that gave birth to two calves three weeks apart. She calved first on April 16 and again on May 7. The cow and calves are reported "doing well."

California Juliana De Kol 2d, a junior three year old Holstein cow owned by the University of California, has completed a year's test, during which she produced 598.41 pounds of butter from 16,618.1 pounds of milk.

The Kings County farm bureau has organized a dairy department with J. P. Lemon in charge. The department is expected to greatly stimulate the dairy industry in that county.

The third annual "Pork Day" will be held at Hanford November 17. A class for farm centers and one for individuals is provided in the carload lots as well as classes for lot of five and single entries. A class for boys and girls between the ages of six and 14 is also provided. Prizes aggregating several hundred dollars will be offered.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Lame Goat

We have a purebred Nubian goat (doe) that is lame or weak in the hind legs. She was born February 1 and we purchased her two and one-half months later. Up to that time she had nursing and grazing on barley. After we purchased her she ate grain fairly well and grazed but it was about two weeks before we could get her to take any milk. We noticed the lameness about ten days after we had her. She struggles every time we force her to take the milk. Do you think the lameness may be strained muscles from her resistance or is it due to error in feeding?—Subscriber, Compton.

We would guess that the lameness was caused by her struggling when you force her to take the milk. If she refuses the milk why do you force her to take it? If she liked it it would probably make her grow faster but to force her to take will do more harm than good. If you are anxious that she should take some milk why not add a little at first to the water she drinks and increase it later or put a little in the grain she eats and increase it as she will take it.

Worms in Horse

Please prescribe a remedy and the manner of giving it for a horse with large worms. Have seen some expelled that were nearly as large as a lead pencil.—Subscriber, Santa Ana.

Mix one-fourth of a pound of fresh wood ashes with two pounds of common salt. Give a tablespoon of the mixture in the feed once a day. If this does not bring the desired result then get these powders: Powdered gentian, three ounces; powdered nux vomica, one ounce; powdered sulphate of iron, two ounces, and ground flaxseed or cornmeal enough to make a pound. Mix and divide into 16 powders. Give one every evening.

Swelling on Horse

I have a work horse that has a swelling on the front side of the hind leg. It has been there a year or longer and remains the same size. There seems to be a soft spot on top of the swelling that is sore to the touch. Sometimes when stepping over an object as the threshold of a door he acts like a string halted horse.—Subscriber, Santa Ana.

If the swelling is on the joint a blister may do it some good, but after so long a time you can not expect much. If it is the muscle below the joint and is entirely clear of the joint then open it. Make a cut two inches or more long and deep enough to lay the sack wide open. When you get it open you will probably find the cause of the trouble. Scrape out the cavity

with the edge of a stiff spoon, then wet the inside of the cavity once a day with a solution of permanganate of potash, half a dram to the quart of water. Warm the solution and inject it with a syringe or use a swab.

FEED GRAIN EARLY TO SKIM MILK CALF

At the time calves are changed from whole to skim milk, they are ready to begin eating small amounts of grain, which should be placed before them in small feeding boxes. Or if they are tied in stanchions for milk feeding, the grain can be put in the manger before they are released. Just a very small handful is all the calf will take at first, and only as much should be fed as the animal will clean up.

Ground corn is very palatable, and it can be fed alone or in combination with other grains, such as ground oats, bran, and some oil meal. It sometimes helps to get the calf started on grain by putting a small amount on its tongue and muzzle when the empty milk pail is taken away. This also puts a stop to sucking the ears of the calf in the next tie. After the young animal's appetite for grain has increased, the corn and oats can be fed whole, but many feeders continue to let them have ground grain.

A good grain mixture to feed to growing calves is made up of 500 pounds of ground corn, 300 pounds ground or whole oats, and 100 pounds linseed oil meal.

Hay can also be placed before the calves at this time in a small rack. Clover hay, mixed clover and timothy, or alfalfa hay not too leafy, are all satisfactory.

An early start in grain and hay insures the proper development of the digestive organs of the young animal and assists in promoting vigorous growth.—M. H. Fohrman, superintendent of official testing, University Farm, St. Paul.

SAN FERNANDO ALFALFA GROWERS

About 150 alfalfa growers of the San Fernando Valley met at the high school at Van Nuys recently and formed a local association, to be affiliated with the Alfalfa Growers, Incorporated, of California. L. T. Guild was elected chairman and Fred S. Owen secretary. H. M. Maddaford, general sales manager, and Vice President Gregory, both of the state association, explained methods of marketing and plans of their association. Those elected to complete the association are: E. L. White, Burbank; B. Maxwell, Lankershim; T. M. Edmondson, Van Nuys; E. D. Grant, Van Nuys; Ben Kenney, Owensmouth; L. T. Guild, Jr., San Fernando; J. R. Anderson, Zelzah; A. J. Gibson, San Fernando; Fred S. Owen, San Fernando. About fifty contracts were signed up at this meeting and an active committee from each locality put in charge of the membership campaign, which will be followed up vigorously, and it is expected that 90 per cent of the growers of the San Fernando Valley will be in line with the association by the time the incorporation papers are received. Another meeting was held May 20, at which the organization was perfected.

THE DAIRYMAN'S OPPORTUNITY

By A. J. Cramer

Prof. G. C. Humphrey, Wisconsin college of agriculture, says: "Now is the time to make herd improvements."

Not all pure bred sires, cows and heifers are 100 per cent in quality. We select quality from quantity. Cull the herd more closely (at this time) than ever. Keep only the best foundation animals, having regard for breeding, individual excellence and production records. Be more particular about the kind of bull you will use.

How to measure a bull for quality, on scale of:

Individuality.

Breeding, pedigree, ancestry, etc.

Production records on part of dams and granddams.

Production records and excellence of daughters.

The older bulls will be the ones that can be measured most accurately on the four points of the above scale.

Younger bulls will be measured on three points:

Are they good enough in all of these respects? If not, now is the best time to buy others at reasonable prices.

Take advantage of going to sales and buying a better bull if the opportunity permits. This insures your future herd becoming best possible in breeding, individuality, quality and production.

Send your present bull to the shambles if he is undesirable, otherwise your neighbor may be glad to use him in place of a scrub or grade bull. If his daughters are not tested you may well afford to have your neighbor keep him for a long enough time to prove what his daughters will do in production.

Do everything possible to get your neighborhood and community started to breeding and developing the class of cattle that will be in greatest demand when such demand is restored. History is bound to repeat itself and every period of depression in prices and slow demand will be followed by a rise in prices. It will take all of the time of what may be a period of years of depression to build up the kind of a herd that will best enable one to reap the harvest of the better times sure to follow.

TRUTH IN FABRIC

Quoting from a letter received from the National Sheep and Wool Bureau of America:

"Hearings on the French-Capper Truth in Fabric bill (S. 799) will be held by the senate's interstate commerce committee at Washintgon, D. C., beginning June 1. Those who favor the sale of unidentified shoddy (reworked rags) as virgin (new) wool under cover of the misunderstood popular term, "all wool," may be expected to turn out in full force to register their opposition to the measure. The friends of "Truth in Fabric" should attend in at least equal force to plead—in behalf of square business dealing, the cloth buying public and American sheep husbandry—that the measure be speedily enacted.

Milk is good for adults as well as for children and babies.

The corn field is an expensive germination tester.

Rich soil gives rich blooms.

OBREGON SEEKS U. S. BREEDERS

President Obregon of Mexico is desirous of making his country a land of pure bred stock. In order to realize his ambition he feels that he must have in Mexico large numbers of expert American breeders. The Terrazas concessions recently were cancelled by Obregon because he felt that the present representatives of that family were not living up to their agreements with the Mexican government and were letting land lie idle that should maintain pure bred cattle.

The first considerable body of American breeders of pure breds to arrange for settlement in Mexico come from Illinois and Iowa. They are led by George V. Boatright, a farmer and feeder, formerly of Kankakee, Illinois. The Boatright colony has leased several million acres of grazing and farming land from the Obregon government, with an option to buy the land at the end of a term of years. Under the charter of the colony only pure bred stock will be produced.—American Hereford Journal.

20%
PRICE REDUCTION
On GOODRICH TIRES
Endorsed By Users and Dealers

The decisive reduction of 20 per cent. on the prices of Goodrich Silvertown Cords, Goodrich Fabrics and Goodrich Inner Tubes, which took effect Monday, May 2nd, received the endorsement of both tire users and dealers throughout the country.

It was accepted at its full face value as a helpful economic move in tune with the times.

It conforms to present conditions and carries out in a straightforward way constructive merchandising methods.

Goodrich Tires have earned their reputation and standing with motorists by sheer quality of construction and complete dependability of service.

Quality in a tire rests not only upon the materials of which it is made, but also upon the experience and skill of its makers.

Every advance in construction and improvement in making, with many exclusive betterments, is in the Goodrich tires you buy today.

Your Goodrich dealer is ready to supply your needs.

The B. F. Goodrich Rubber Company
Akron, Ohio

Big Milk Producers

On Easy Terms

The combination sale of registered Holsteins to be made for Burr Farm, Los Angeles, and Agee Bros., Rivera, contains an unusually attractive lot of fresh and heavy producing cows, in fact especial attention was given to this feature by both owners in making selections for this offering. The financial terms on which these cattle will be sold are so liberal that in many cases they will have paid for themselves in milk production long before the last payment comes due. The sale will total

60 REGISTERED HOLSTEINS 60

BURR FARM---AGEE BROS.

At Burr Farm, Los Angeles, Cal.

Thursday, June 9, 1921, at 10 A.M.

The females in the offering are not only heavy producers, but they are of most substantial breeding as well, and those that are bred are in calf to bulls that lend value through the calves they are carrying. Many of these good cows are bred to KING KORNDYKE PONTIAC 20TH, SIR VEEMAN KORNDYKE PONTIAC, KING PONTIAC TOLA ORMSBY, TOYON FAYNE VALDESSA, SIR MANUEL HENGERVELD, every one of which is out of a 30 to 36 pound dam or a dam with over 1,000 lbs. butter in one year.

There are many individual females with official records from 20 to over 27 pounds butter in 7 days, some with good yearly records, and a large number now on yearly test.

EIGHT YOUNG BULLS IN THE SALE

Dairymen will find eight desirable young bulls in the offering, choice young fellows from every standpoint to breed production and type into the herds which claim them in this sale.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

TERMS OF SALE: One-third cash, the balance in twelve equal monthly payments, with approved notes at 8 per cent, live stock insurance on deferred payments, if arrangements for credit are made before sale. In absence of prior arrangements the terms are cash. Applications for credit should be made to the sale management.

H. A. De Wolf Herd

Ripon, Cal.

Wednesday, June 15, 1921

It will be remembered that when the foundation of this herd was laid some years ago Mr. De Wolf was a prominent buyer of some of the better things in a number of the good sales. The present herd although not large in numbers is made up of choice individuals, including a splendid lot of young granddaughters of the good bull Sir Skylark Ormsby Hengerveld.

The offering will consist of forty females and ten bulls, including the two herd sires, one of which is a son of Sir Skylark Ormsby Hengerveld and the other a son of King Mead of Riverside.

Watch for details later, but write for catalog now.

Are Milking Machines Profitable?

By Arthur L. Dahl

THE trend of all agricultural activities is toward the use of mechanical means for carrying on as much of the work of production as possible. This tendency not only follows the practice universally followed in modern manufacturing industries, but is made necessary by the shortage of competent labor on our ranches. This is particularly true of dairy farming. Care must be used in the selection of help to tend milk cows, for every man that wants to work in the country is not fitted for dairy work. Cows are sensitive machines, and to get the best results with them the men who attend to their wants must be quiet and gentle and have the knack of making friends with them. One of the owners of a large dairy ranch in Northern California recently said that the greatest problem he had to solve was to keep good men, in spite of the fact that living and working conditions on that particular dairy farm were unusually good. Without the use of milking machines this owner would not have been able on numerous occasions in the last two years to have kept his plant going profitably.

California does not rank with Wisconsin, Minnesota and some of the other big dairy states of the Union, but dairying is now an important industry here and it is fast growing bigger, as evidenced by the new establishments that are springing up at various points for the making of condensed and powdered milk products. These plants operate on a large scale and they must receive daily immense quantities of fresh milk and cream. In turn they provide a stable market for the dairy products produced in the vicinity of the plant.

Milking machines have been on the market for a sufficiently long time to demonstrate their worth, and the experiment and development stage necessary in the life of any new invention has been passed, so that it is now possible to rather definitely determine when and under what conditions the use of a milking machine is warranted. A number of the state experiment stations have conducted thorough examinations and careful tests of the different types of milking machines, and the results of these investigations are available for those interested.

As a result of such an investigation made by the University of California experiment station it was found that the modern milking machine is a practical and safe labor saving device. Where failures have occurred they were found to be chiefly due to the fact that the owner did not fully understand the mechanics of the machines or appreciate the necessity for care in operating and keeping them clean. As the manufacturers have been zealous in developing and simplifying their machines and making them as "fool proof" as possible, the number of failures have greatly decreased in the immediate past.

The California experiment station authorities found that "any farmer with a fair degree of intelligence and resourcefulness need not hesitate to install a milking machine in his dairy if he keeps 20 or more cows. In many cases it may prove advantageous to adopt machine milking also in dairies of 12 to 15 cows, as it will make the owner less dependent upon or entirely independent of hired help."

While there are other considerations which lead many dairy farmers to install milking machines the principal one is the saving of labor. Where a number of cows are kept it is of the utmost importance that the routine work of milking and preparing the product for market be restricted to as short a period as possible, and the more work accomplished by mechanical means the less dependence must be placed upon extra hired hands.

Officials of the department of agriculture have ascertained from studies made in different dairy communities that the time saved by the use of milking machines increases with the size of the herd. For instance, in a herd of 15 cows or less the average time required to milk a cow by hand is a fraction over seven minutes; by machine, a fraction under five minutes. With herds of over 50 cows it takes slightly under seven minutes to milk a cow by hand and but 4.15 minutes by machine. With a herd of over 50 cows one man with a machine milks on the average about 28 cows per milking as against 17 where the milking is done by hand.

At the Kentucky experiment station a very careful study was made of milking machines, and it was found that five different men assigned to milking 14 cows with a machine averaged 3.1 minutes per cow. In other words, two of these men operating double unit machines can milk 28 cows, strip them, feed and carry the milk to the dairy room in 43.4 minutes. The average of many observations made in connection with hand milking indicates that this same operation, performed by two men, required one hour and 20 minutes.

The records of many individual owners of milking machines show that with the machine they can do at least twice as much work as by hand. L. E. Bowen of Montesano, Washington, found that with a milker he could save the wages of a hired man, and Fred T. Butterbrodt of Burnett, Wisconsin, milked as many cows with his machine as previously required the services of three hired men. D. J. Kirkland of Bloomfield now milks his 40 cows alone by using a milking machine, thus allowing his hired man to continue working in the fields.

While a study of costs made by the department of agriculture showed that it cost slightly more to milk with a machine in small herds than by hand, the larger the number of cows kept the greater the saving with the machine. On 32 of the farms using machines for milking small herds it was found that in spite of the cost per cow being greater for machine milking than hand milking the annual saving in hired labor amounted to $2.63 per cow through the dropping of hands who had been kept primarily to do the milking.

One dairyman who kept a record of the cost of milking by hand and by machine reported that the average cost of milking 20 cows by hand was $1 per day, or $365 per annum for labor alone, while with a double unit machine the annual cost was $176, or a saving of $189.

In commenting upon the effect of the machine on the milk yield of cows the men who conducted the Kentucky experiments stated:

"The effect of machine milking on the milk yield of the cows has been a paramount issue whenever the mechanical milker has been mentioned. Most dairymen believe that the machine will cause a decrease in milk production, and many dairymen who have fine, high testing cows have failed to take kindly to the machine for this reason. After carefully tabulating the milk yield of each cow for 30 days before the machine was used and for 30 days after its use was begun, we can state definitely that there was no appreciable or permanent decrease in milk production during the short period when the cows were becoming accustomed to the mechanical milker."

It is a well known fact that some hand milkers secure a greater quantity of milk from cows than others and that when a cow has become accustomed to the touch of one individual a change to another has an effect upon production. With the use of machines it has been the universal experience of users that once the cows become accustomed to the teat cups they will give a more uniform production than under hand milking. Some owners even go so far as to say that milking machines increase the quantity of milk and lengthen the lactation period, though this fact is not generally borne out by universal practice.

It has been demonstrated, however, that a nmber of highly sensitive cows are more satisfactorily milked with machines than by hand, as the uniform action of the suction cups has a soothing effect. Walter A. Carr of Hemet states that one cow of nervous disposition in his herd was, through apparent abuse of hired help, becoming a

vicious kicker. Hand milking was at times impossible, but when a milking machine was tried she became gentle and tractable and her milk production was increased.

When milking machines are properly cleansed and handled the milk obtained from the cows is found to be cleaner and purer than when hand milking is practiced. Milk as it comes from the udder is practically free of bacteria, and these are added by the contact of the milk with outside sources of contamination. The mechanical milker is so constructed that if properly cleaned before using, and if the cows' teats are washed before the cups are fastened, the milk drawn from the udder will be as free from bacteria as the most careful hand milking will produce. In the larger dairies the barn equipment is so arranged that the milk drawn from the cows is instantly taken by pipe lines to the receiving room, and at no stage does it come in contact with the open air or the hands of the operator.

Like the tractor in the fields the milking machine in the barn will enable the farmer who keeps enough cows to justify its use to do the milking faster and under more sanitary conditions. It will materially reduce the labor requirements on the farm, often to the extent of displacing one or more hired hands, and from this standpoint it will save money for the owner. Lacking the uncertainty always to be considered in the human element, the machine is more dependable than a hired hand and is always ready for use when wanted. The cost of operation is small, and anyone can learn how to operate the milker after a little instruction.

CONSTRUCTION BEGUN ON PACIFIC INTERNATIONAL ADDITION

Construction has been started on the addition to the Pacific International Livestock Exposition plant at Portland. This will provide housing sufficient to take care of 750 beef cattle, 850 dairy cattle, 400 horses, 1,000 hogs, 1,000 sheep, 250 goats, 2,500 coops of poultry and rabbits, with plenty of space remaining for the boy and girl club exhibits. Besides this there will be erected immediately in front of the present building, and connected with it, a machinery hall and dairy products building, sufficiently large to take care of the many varied exhibits of allied farm life. When completed and ready for the show, November 5-12, there will be a trifle more than ten acres under one roof, making it undoubtedly the most complete building of its kind in the world, a building so arranged that every breed of livestock has an equally good position in its relation to the amphitheater, and a plan permitting of indefinite extension without impairing the general scheme of things. That the Pacific International has made a tremendous impression on the breeders of the United States is evidenced by the friendly references made to it and to the many ads appearing in national publications advertising sales, in which the winnings of the Pacific International are a prominent part. Those connected with the Pacific International organization have endeavored at all times to assist in building up shows of a like character here on the Pacific slope, recognizing very clearly their importance to each other. Here we find working in harmony breeders of all the different kinds of livestock, something that has been considered rather an impossibility in other sections of the country. The show is equally well balanced from a beef and dairy standpoint, its board of directors being well divided among the different breeds, and it has been my observation that many happy friendships have sprung up between men of opposing breeds who, up until the time of our joint organization, had known little or nothing of each other.

Large as was our show in 1920, present advices from all sections of the country, and many sections far more distant than heard from in previous years, make us feel that the showing in every section will be stronger than ever before. Some conservative breeders regard this as a strong statement, but our expectations for 1919 and 1920 were more than fulfilled in each case. —O. M. Plummer, General Manager.

There will be a meeting of the American Angora Goat Breeders Association during the Pacific International Livestock Exposition at Portland, November 5-12.

Third Public Sale of Shorthorns

at the Farms, West Sacramento, Cal.

Wednesday, May 25

50 SELECTED FEMALES AND BULLS 50

15 Scotch Cows — The fifteen straight Scotch cows and heifers that have been listed were selected with the view of affording breeders a chance to add to their herds breeding material of the highest quality. There will be Acanthus, Orange Blossom, Rosa Hope, Campbell Ury, Roan Lady and other popular tribes. Such material carrying the services of the three great Caledonia herd bulls should be eagerly sought after by all breeders. Several of the cows sell with calves at foot.

25 Scotch Topped Cows Caledonia herd bulls. — The Scotch topped material represents a rare collection of big, thick fleshed, heavy milking cows that will return any man a handsome profit for their keep. Every one can boast of a most unusual list of sires in their pedigrees. No man can go wrong in purchasing such useful cattle. They too, carry the services of the three famous

Imp. Caledonia Gainford Matchless
Pine Grove King

It is entirely conservative to state that no herd in America has three better bulls in service. Think what an opportunity this sale affords California breeders to add to their herd's bloodlines of the best. If you own Shorthorn cattle now, or expect to buy, you positively cannot afford to miss this event. Get to the top quick through the use of such blood.

10 Young Bulls — The ten young bulls include six Scotch and four Scotch topped. They run in ages from 12 to 24 months. They are well grown, well bred and of good colors. Several are extra good prospects. Here is a chance to buy just the sort of bulls you need and at your own price. Remember the better the bull—the better the steers.

Terms: One-half cash, balance in six months on approved security. Arrangements must be made prior to sale with sale manager.

Every lot guaranteed a breeder.
All over six months old sell tuberculin tested.

GOATS

Milk Goats, some registered, prices $15 to $30. Francis Rudkin, Fillmore, Calif.

FARM LAND FOR SALE

FOR SALE
Seven Acres and a Bungalow. Hardwood Floors, Electric Range, Kewanee Water System

$16,500—Located 3 minutes' walk from the station in a high-class neighborhood, we have for sale 7 acres in bearing orchard, 4 acres Blenheim apricots, 10 to 12 years old, 2½ acres French prunes, 4 and 5 years old; has a fine modern bungalow of 5 rooms, modern plumbing, hardwood floors, open fireplace, electric lights, also an electric range; there is a domestic Kewanee water supply with high pressure storage tank; complete set of outbuildings, garage, room for help, stable and a new modern poultry plant with capacity for from 1,200 to 1,500 chickens, tools, incubators, farming implements, etc., go with the place.

$30,000—100-acre dairy ranch located near Mountain View. The place is all fenced and cross-fenced, and divided into several fields. There is a good modern dairy barn with stanchions for 60 cows, also milk house, garage, hay barn, and other outbuildings. There is a 7-room dwelling which is now vacant and ready for occupancy. Terms of payment can be arranged, and a purchaser can get immediate possession.

$20,000—17 acres of creek bank sediment soil, planted as follows: 9 acres in bearing peaches, 6 acres in bearing apricots, and 2 acres dry ground and building site. This is a remarkably good producing orchard — it paid net and clear of all expenses the last 3 years: in 1918, $2,099.01; in 1919, $3,-153.33; in 1920, $3,351.83. The income for 1918 and 1919 represents the peach crop only, as the apricots were not in bearing until 1920. 400 fruit boxes, 500 drying trays, and 4,000 tree props go with the place. This property is owned by non-resident partners who have interests in other parts of the state that need their attention; hence this low price. Terms of payment can be arranged.

$25,000—20 acres, located near Mountain View, in a good neighborhood. 10 acres in bearing orchard and 10 acres in four-year old French prunes. Has a good residence of 7 rooms with the modern conveniences, good plumbing, electric lights, etc. Complete set of outbuildings, barn, garage, cottage for help; poultry, horses, farming implements and equipment go with the property. Can be bought on terms.

A HIGH-CLASS DAIRY PAYING NOW OVER $1,200 A MONTH

We have for sale a fully equipped modern dairy now stocked and running and producing over $1,200 a month from the sales of milk alone. Consists of 80 milch cows, 15 heifers and springers, 3 pure bred Holstein bulls and 6 calves. The dairy is on a 160 acre leased ranch. The lease has 5 years to run, and the ranch is equipped with a complete set of buildings, including a 7-room dwelling, cottage for help, modern dairy barn with milking machines, separators, etc. There are 40 acres in alfalfa. Complete set of farming implements, four work horses, two driving horses, etc., go with the place. Price $17,000. Rigid investigation invited. This property is offered for sale for the reason that it is owned by partners who wish to dissolve the partnership.

KILL THE BUGS

The extremist whose religion prevents him from taking life has no place in the farming game. He who would produce food and raiment has not ended his fight when he has conquered abnormal weather conditions. When he has finished the good fight of preventing Jack Frost or June Heat from doing his crops to death he then has to take up the fight with weeds and varmints and fungus, and then to cap the climax, with about a million of insects which are chewers and suckers in all their various stages of growth. Hoes, cultivators, traps, caustics, poisons, deadliest of gasses all have to be brought to bear if we would win. Of the many questions which come to the Cultivator office appealing for help none come more often than this of pest control.

This week we give from the pen of Fred K. Howard suggestions for the vineyardist as to the control of the vine hopper. This pest hovers in myriads over the bearing vines. He is of the sucker class and the vitality of the vine is soon gone unless he is brought under control. A very small percentage of nicotine dust in kaolin or other neutral carrier suffices. Hand and power dusting appliances now enable swift and effective application.

Another serious pest is the red spider. Almond and other orchards have been seriously reduced in productivity because of this ever present enemy of the nut and fruit grower. We have an illustrated article from the pen of E. R. de Ong. We had hoped to give it alongside of Mr. Howard's in this issue. It is, however, held over and, will make one of the leader articles in the Cultivator of May 28.

Meantime lay for these and other pests and get them before they get the fruit.

LIME

The gospel of lime is being preached today as never before. The scientist has preached for years, "A lime country is a rich country," but all of us are getting into the procession more than ever. California is a "lime country." It is rich. It will be richer, for its soil problems are being studied and wherein they are still lacking in producing to the highest is becoming better known.

BEAN GROWERS AND THE TARIFF

The bean growers of California should at least see a rift in the clouds in the action of the senate in passing the emergency tariff bill, which includes a two cent tariff on imported beans. While it is true that this amount was not all that was asked for, it will at least put California beans on something like an equitable standing with the Oriental product in our own markets.

Too much credit cannot be given the California Bean Growers Association for securing this legislation, for it was mainly through its efforts that the tariff on beans was finally passed. The association started its campaign early in 1919, sent a committee to Washington and has consistently kept up its fight for the protection of the bean industry.

It is also a striking object lesson of what cooperative effort can accomplish, for without the association it is doubtful if the industry would have been able to secure this vitally necessary legislation, and one of the most important agricultural activities of the state would have practically been forced to go out of business, meaning a loss of millions of dollars to growers.

The association has already begun preparations to secure the four cent tariff originally asked for, and which it expects to have incorporated in the permanent tariff bill to be acted upon this fall. Every grower of beans should give the association his support in its endeavor to further the interests of the industry, and which he is financially interested in.

Book Review

NATIONAL STANDARD SQUAB BOOK

"The National Standard Squab Book," by Elmer C. Rice, Melrose Highlands, Massachusetts, published by author.

"This manual or handbook on squabs is written to teach people, beginners mostly, not merely how to raise squabs, but how to conduct a squab and pigeon business successfully. We have found breeders of squabs who knew how to raise them fairly well and took pleasure in doing so, but were weak on the business end of the industry. The fancier, who raises animals because he likes their looks or their actions, or because he hopes to beat some other fancier at an exhibition, is not the man for whom we have written this book. We have developed squab pigeons and the squab pigeon industry solely because they are staples, and the squabs they produce are staples, salable in any market at a remunerative price. The success of squabs as we exploit them depends on their earning capacity."

The book consists of a dozen chapters, the last one being given up to questions and answers. Then follows a supplement and appendix, so extensive in fact that it makes up a large part of the book. There are scores of illustrations. The various chapters touch upon squabs pay, easy start, unit house, nest bowls, water and feed, laying and hatching, increase of flock, markets, ailments and finally questions and answers.

THE KING SNAKE

One of Yosemite national park's most interesting snakes is the King snake. The King snake was a great favorite of forty-niner gold seekers. Finding it throughout the country infested by rattlesnakes, snake stories, with the ready imagination of that time, were soon told of its hunts for big rattlers. These yarns finally crystalized into the well known mountain superstition. The King snake does eat other snakes, but it is surely nature faking to say that it deliberately starts out on a hunt for the rattlesnake.

NEW ORANGES AND NEW CULTURE

By Ernest Braunton

"We have several new oranges of promise and several varieties of other citrus that may yet find their way into commercial orchards," said Dr. J. T. Barrett, acting director of the Riverside citrus experiment station. "Among the better oranges given a good trial here and which appeal to me as of value are: Bessie, Boone's Early, Brazilian, and Starr; also one we have numbered 311. Then, too, we have a good new pomelo known as Imperial, though it is not seedless." Growers given to experiments should send for buds of the new varieties and give them a trial. And June is a good month for budding.

Farm Advisor Hodgson of Los Angeles County and several farm center directors held a field day at the experiment stations (there are two, the old and the new) to canvass the results and accomplishments of 14 years work experimenting with fertilizers, root stocks, etc. The old station, where the state owns but three acres and leases about 20, has no new orchard work, though the chemistry laboratory is still there and in active operation. The new site, of broad and sufficient acres, is on the opposite side of the city of Riverside and is a veritable "land of promise" compared with the Rubidoux station.

The young orchards, now four years old, are not surpassed in size and vigor by any the writer has seen, and they have received no fertilizer except what was grown on the land—bean straw. In addition to this the Blackeye bean crop has each year paid within $15 per acre of the total cost of planting and maintenance.

This new station work was started right. Before planting soil samples to the depth of four feet were taken in many parts of the orchard plats and stored away for reference in future years. Each tree of the many hundreds is numbered, measured each year, close crop production records kept and everything done to insure the greatest possible value from each experiment. There is so much to tell of this station that we will have to leave the remainder for another story.

FARMERS OWN HALF THE AUTOMOBILES

Farmers are interested equally with city dwellers in good roads and highways over which they can run their automobiles both for business and pleasure. Farmers own and operate fully 50 per cent of the automobiles and trucks in this country, the total of which now exceeds 9,000,000. They wore out fully half of the 24,000,000 tires used last year and will buy their share of the 27,000,000 tires required this year to keep the cars running. Yet these same farmers know that they travel mostly between their farms and the nearby cities—just as most city people rarely take long distance tours. The farmers are interested in a road program that takes into consideration the development of the road system of their state and at the same time makes provision for intercountry and interstate highways.

The Dowell bill requires each state receiving federal aid to designate through its highway department a connected system of roads, interstate in character, not to exceed seven per cent of the total roads mileage, and to classify the roads of this system into two groups, primary or interstate and secondary or intercounty. But this is only a starter. As rapidly as the state has funds to construct additional intercounty roads the percentage will be increased.

A new bridge is soon to be constructed on the Hassayampa River near Wickenburg, Arizona. This is on one of the direct roads between Phoenix and Los Angeles and the bridge will be much welcomed by the traveling public.

The man who makes the quickest motions is not always the one who does the most work—it is the man who makes every move count that accomplishes things. — Merchants' Magazine.

No Failures Trapping Gophers

The above heading is not written for the purpose of fooling the readers of this column. Our daily mails are full of orders for **Chubbuck's Double Catch Gopher Traps**, with the number of repeat orders rapidly increasing. The farmers, owners of Double Catch Traps, write our advertisements for us. Here are two letters snatched from the latest mails:

Enclosed is my check for $3.00 for which I would ask you to send me **four more** gopher traps. It might be of some interest to you to know that this is the only trap we have ever had that would really catch gophers. **My man reports that he has caught more gophers with the first four traps than with all the traps and poisons he has put out in the past year,** that he has been in my service.—Frank A. Guernsey, Manager, Sacramento-San Joaquin Bank, Stockton, Calif., 4-30-'21.

Recently an advertisement about your gopher traps came to our notice. It looked like a strong "adv." but since it appeared in a reliable farm paper, we decided to try one on a smart gopher which steered clear of every trap we ever set for him. The gopher got the worst of it in the course of an hour after setting the Chubbuck, and we have been fooling gophers ever since. Before that they sure fooled us. A trap like that is a real blessing for a pest-ridden locality. Now make something just as effective and simple to trap ground squirrels and we shall call your name blessed indeed. Thanking you for calling our attention through your truthful advertisements, and wishing you every success. — Brinkmann Brothers, Lathrop, Calif., 5-9-'21.

If you cannot secure these traps from your local Seed stores or Hardware dealers, send direct to us. **Price, postpaid 75c.**

Look for Paint

That's Cracked or Checked

DON'T let *your protective coat of paint crack* and come off. Even tiny breaks will let weather in, and that means decay.

You can't save by not painting, if your paint is wearing out.

Look for those signs and *paint now,* if you need paint.

The best paint spreads more easily —saves labor cost. It covers more square yards—you buy more gallons of cheap paint.

The best paint, if properly applied, protects the house five or more years longer.

There is no question as to which *costs* less. Don't allow surfaces to rot. It costs less to paint them.

* * * *

The best paints are scientific in formula and preparation. We've made them for 72 years—to meet weather conditions in the West.

The best materials — pure PIONEER WHITE LEAD, pure linseed oil, zinc, and color in scientifically exact proportions, arrived at through 72 years' experience.

Our process super-purifies and "whitens" the lead base. It must be fine enough to pass through a silk screen with 40,000 meshes to the square inch. A fine lead means easier spreading, and a more elastic, tougher protective coat. The "whiter" lead base means more beauty in the colors. Such paint will last five or more years longer than cheap paint, if properly applied, and look better through the years.

House Paint: Fuller's Pure Prepared Paint, Phoenix Pure Paint, for Painting Houses. The purest, best protective and most durable paint made. Made in 32 colors.

BARN AND ROOF PAINT: A protective coating for barns, roofs, fences. Dries with a good gloss and wears. Economical in cost and dependable in quality. Six colors to select from.

FLOOR PAINT: Fuller's Rubber Cement Floor Paint—sanitary, water-proof and durable paint for floors of kitchens, closets, etc. Attractive in color and gloss. Dries hard over night. Made in 12 colors.

IMPLEMENT PAINT: Fuller's Pacific Wagon Paint adapted for repainting agricultural implements, farm wagons, wind mills. A glossy, durable finish offered in 7 colors.

Hurry the Cockerels Off

By Jean A. Koethen

FROM the day the hatch comes off the preparation of the cockerels for market should be kept just as clearly in mind as the developing of the pullets into layers. The cockerels are a side line, to be sure, but they cannot be eliminated. As long as half the chicks hatched are cockerels, just so long must they be considered and turned into an asset if possible.

In the beginning all the chicks are fed alike, and whatever produces most rapid growth is good for all alike. Bran for the protein it contains, which is needed for the building of the deep tissues; corn meal for fat, ground oats for frame, some animal meal to add protein, the most essential requirement of the little chicks, are fed to all alike after the first week. Not until pullets and cockerels are separated, at two months of age, need any change be made in the feeding of the latter.

Feed Cockerels for Weight, Pullets for Muscle

When the sexes are separated it is customary to give the pullets as much range as possible, and the cockerels as little. They are not fed in crates till the last two weeks, but it is well to keep them in small yards so that they will not be disposed to overexercise. Too much exercise makes tough, stringy muscles, highly undesirable in a broiler. The pullets, on the other hand, develop more satisfactorily under free range conditions. They should not be fed for weight but for frame, and the more they exercise the more fit will their muscles be for the work of production. Bran, wheat, oats and green stuff, with milk available part of the time, and not too much beef scrap, lest they begin to lay prematurely, is the ration for pullets. Cockerels require less bran and a good deal of corn. Ground oats are a part of most fattening rations.

From the time the cockerels are separated they should receive a moist mash once a day. Three weeks before they are to go to market begin giving the moist mash morning and night, with a feed of cracked corn at noon. Moisten the mash with sour milk or buttermilk. "Milk fed" broilers are to be found in every market these days, and one can hardly expect a top price without using milk.

Crate Feeding

Two weeks before marketing the birds are put in crates and kept on a ration of moist mash. The mash used at Cornell consists of 50 pounds corn meal, 20 pounds middlings and 10 pounds ground heavy oats. This is mixed to a batter fresh three times a day with sour milk. Another good ration consists of 2 pounds corn meal to 1 pound each of middlings and ground oats. This is moistened with 8 pounds buttermilk and is allowed to stand and sour 24 hours before feeding. It is fed in a trough outside the slats in front of the crate.

Birds that are being crate fed should eat ravenously. If they do not, there is something wrong, and they should be removed from the crate. Crate feeding, if carried on longer than two weeks, is apt to put a bird off its feed, and it will then lose weight more rapidly than it gained before. The mash should be left before the birds half an hour. Water is not necessary except in hot weather, but grit should be fed two or three times a week.

When crate feeding is not convenient, very good results may be secured by feeding the moist mash three times a day to the birds in their small yard.

Marketing Broilers

White Leghorn cockerels are best marketed as broilers, that is, when they weigh from 1¼ to 1¾ pounds. They are too light to make good fryers, but they grow so rapidly the first three months that they are considered excellent broilers.

Since the Poultry Producers undertook the task of marketing broilers for its members the broiler problem has been less perplexing than formerly. The poultryman receives the wholesale market price when the birds are delivered, and later, after the association's charge for handling has been met, receives whatever margin there is between the wholesale price and the price the Poultry Producers has been able to secure.

Cockerels of the heavier breeds generally bring a better price when kept to 2 or 2½ pounds weight, when they are sold as fryers. If it is not too late in the season they may be even more profitable when kept to soft roaster weight, 4 to 6 pounds. Late maturing breeds, like Light Brahmas, are particularly well adapted to the soft roaster market. If hatched in April they just reach a fine roasting size by Thanksgiving.

TURKEYS SPREAD GAPEWORMS

Turkeys are probably the natural hosts of the gapeworm, a serious pest among young chickens, and are an important factor in their spread. This has been demonstrated by a zoologist of the United States department of agriculture as the result of investigations carried on at Washington, D. C. and on farms in several localities in Maryland.

During three winter seasons beginning in December, 1916, a total of 635 chickens and 679 turkeys were examined in the Washington city market. No gapeworms were found in the chickens, but 22.5 per cent of the turkeys were found to be infested. From one to 18 worms were found in each of the infested turkeys. A report of these investigations has been published by the department in Department Bulletin 939, "The Turkey as an Important Factor in the Spread of Gapeworms."

In view of the complete absence of gapeworms from a large series of adult and approximately adult chickens, and their common occurrence in a similar series of adult and approximately adult turkeys, all obtained at the same market at the same season of the year, it would appear that adult chickens are poor hosts of gapeworms. It is also evident that not merely young turkeys may harbor the worms but that these parasites are very common in adult turkeys. That turkeys above three years of age may harbor gapeworms is established by the fact that a turkey which was kept at the department's experiment station at Bethesda, Maryland, for three years after it was brought there was found after its death to be infested with a pair of worms.

In the perpetuation of gapeworm from year to year on infested poultry farms the two chief factors appear to be turkeys and contaminated soil. Whether, in the absence of turkeys from a farm, gapeworm affliction among chickens will regularly disappear has not been definitely established, but it seems probable that it may often do so. Gapeworms among chickens appear to be more prevalent on farms where turkeys frequent the chicken runs than on farms where there are no turkeys. Available evidence indicates that gapes has a tendency to disappear on farms following the removal of turkeys.

Losses from gapeworms can be greatly reduced, if not altogether avoided, by keeping young chickens on ground that has not been exposed to contamination within at least a year by chickens with gapes or by turkeys and by excluding turkeys from it during its occupancy by chickens. As gapeworms appear rarely to occur in adult chickens, brood hens may be associated with young chickens with little risk of infection.

BOLL WEEVIL LIKES ALL COTTON

Boll weevils develop about as rapidly and live as long on one kind of cotton as on another. They seem to adapt themselves to new conditions rapidly and become organized to carry on their work of destruction without delay. These points are brought out in detailed studies of the pest in the states east of the Mississippi, covering a period of two years, conducted by entomologists of the United States department of agriculture at Madison, Florida.

Poultry Queries

Conducted by Jean A. Koethen

Roup or Stickers?

Some of my White Leghorns have a disease which makes them go blind in one eye. The eye fills with a yellow substance; some die but others recover. I first thought it was roup and put potassium permanganate in the drinking water, but it did not check the disease.—Subscriber, Owensmouth.

Are you sure this trouble in the eyes is not due to foxtails that have worked down into the passage between the eye and nostril? I would examine each hen very carefully. At this season when hens on range are certain to come in contact with foxtails and hens that are confined are frequently given unthreshed barley, there are many cases of eye trouble that can be traced to the one or the other. Will the subscriber who some months ago told how he cleaned out the passage where foxtails are sometimes imbedded please repeat the information. Of course, this may be roup of the eyes. In any case, the eye should be cleansed twice a day with a boric solution. Dip a bit of cotton in the solution and drop in the eye till the yellow secretion is washed away. Then anoint the edges of the lids with plain white vaseline. Permanganate of potash in the drinking water does no good at all except perhaps to prevent contagion while it is fresh, but dipping the head in a permanganate solution is an excellent remedy for any form of roup. Where only the eyes are affected, however, boric acid is better. A decoction of chamomile flowers may be added to the boric solution.

Mites and Ticks

Will you kindly tell me how to get rid of mites or chicken ticks which infest my chicken house?—Subscriber, Julian.

It is not quite clear whether this inquiry means "mites and chicken ticks" or the writer is not sure what the infestation is. If the house is infested by both mites and ticks it will take a lot of work to clean them out, but generally speaking, the cleaning and disinfecting that rids a house of mites will also destroy ticks. To get rid of mites first scrape and sweep and hose walls and dropping boards till they are as clean as water will make them. Then spray or paint every bit of wood with kerosene and crude carbolic acid, making the mixture as strong as you can afford to make it. The more acid you add to the kerosene the more certain will it be to kill every mite. One part acid to 8 of kerosene is sufficient in most cases, but when the pests have been allowed to breed without interference 1 part acid to 4 of kerosene is better. One painting will not be sufficient; three times a week apart is better. The first painting gets most of the mites; the second gets the nits that have hatched since the first painting; and the third gets anything that is left. Care must be used in disinfecting an old house to get the mites that crawl through the cracks to the outside. The only sure way is to paint both sides of every board.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

The seven highest pens in the California farm bureau egg laying contest for April are: Hollywood Farm, Hollywood, Washington, 239 2/3 eggs; S. L. Gibson, Santa Cruz, 239; Hanson's Poultry Farm, Corvallis, Oregon, 237; Geo. Gray, Santa Cruz, 233; D. B. Walls, Petaluma, 233; D. B. Walls, Petaluma, 233; W. A. Ford, Umatilla, Oregon, 230.

Hanson's Poultry Farm took first place again for pen totals to date, forcing Hollywood Farm into second, while W. H. Marshall of Santa Cruz ousted S. L. Gibson from his long favored third seat.

At the end of the first six months 15 pens have passed the 100 egg average per hen. High standings are as follows: Hanson's Poultry Farm, 1,257 eggs; Hollywood Farm, 1,251; W. H. Marshall, 1,205; S. L. Gibson, 1,196 2/3; Geo. Gray, 1,196 1/3; W. A. Ford, 1,170; R. J. Kenter, 1,103; Santa Barbara Poultry Ranch, 1,079 1/3; S. L. Gibson, 1,079; S. L. Gibson, 1,072; F. L. Spacher, 1,054; Warren Wood, 1,046; C. E. Hyde, 1,043; Alex Stewart, 1,012 1/3; La Rita Poultry Farm, 1,011 1/3.

Leading hens to date (over 75 per cent production for the 181 days) are: Hollywood Farm, 146 eggs; Chas. Lehman, 145; J. S. Conrado, 144; La Rita Poultry Farm, 143; Hollywood Farm, 142; Hanson's Poultry Farm, 141; Geo. Gray, 141; Ed. Crewdson, 140.

Boys in the manual training class of the Casa Grande, Arizona, high school are doing double duty by making rabbit traps as a part of their school work, the rabbit traps being used to help the farmers to exterminate some of these pests.

Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote — "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks died. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa.—"Not a case of white diarrhoea in three years." C. O. Petrain, Moline, Ill.—"I never had a sick chick all last season." Mrs. Wm. Christiana, Olive Ridge, N. Y.—"Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning. 75c and $1.50 pkgs. Baby Chick Book FREE.

Fire Warning

Fire assumes many forms to get to your grain. Passing pedestrians and tourists, trains, careless smokers, automobiles, harvesters and sparks from gas engines—any one of these causes may drop that smoldering spark that in a few minutes is fanned into an inferno of flame. Act now—insure today.

Here are a score of practical suggestions on how to protect your grain against fire, and how to fight a blaze that has a good start. Read them carefully, and follow them faithfully.

Keep all fires under control.

Don't even start a fire unless you know you can keep it under control.

Be prepared to fight fire wherever it may start.

Have adequate spark arrester on all smokestacks.

CHEMICAL FIRE EXTINGUISHERS (Anti-Splash) should be carried on all combined harvesters, headers, threshing machines, and hay balers.

Have spark arresters on exhausts of gas tractors, oil-burning engines, and auxiliary engines on harvesters.

Never leave a fire unwatched.

An extra spark arrester can be made of ordinary window screen, covering a frame 30 inches square.

Lead the exhaust from tractor or auxiliary engines into a tank containing water.

Keep your carburetor properly adjusted.

Employ only reliable men.

PLATFORM

It is the Policy of the Northwestern Mutual Fire Association

FIRST

to conserve life and property against fire.

SECOND

to extend indemnity only to those who use due care to protect their property.

THIRD

to issue non-assesable policies secured by cash resources sufficient to protect against any possible contingency, thus furnishing the safest and strongest insurance obtainable.

FOURTH

to co-operate with all policyholders in lessening the cost of their fire insurance by reducing both losses and expenses.

FIFTH

to give policyholders all benefits derived from their co-operation by returning to them as savings the largest possible portion of the insurance premium consistent with business safety.

DO NOT PERMIT AUTOS TO BE DRIVEN THROUGH STANDING GRAIN.

Have all machinery well oiled and greased.

Keep strangers off your property.

FORBID SMOKING IN YOUR FIELDS OR FARM BUILDINGS.

Have a boy on horseback, carrying a fire extinguisher, follow the combine.

Many communities have their own volunteer fire department located at a central point. If none in your community, organize one.

Get sacked grain into the warehouse without delay.

Should a fire start, give a general alarm and call nearest fire company. Wet sacks and fire extinguishers can be used to advantage. Cans of water should be rushed to the men.

When sacked grain is burning it is just as necessary to extinguish the fire as quickly as if the grain were still standing. Even the slightest smoldering spark in sacked grain is "dynamite."

Be sure the fire is all out!

WRITE TODAY for illustrated, descriptive folders on how to Prevent loss by fire, also name of nearest agent.

HAY AND FEED

Alfalfa Growers of California report under date of May 16:

No. 1 Dairy	17.00
Standard Dairy	15.00

Under date of May 13, A. W. Scott Co. says:
Receipts past week 839 tons. Demand has been extremely light and the receipts have been more than sufficient. The prospect of new hay coming in and the arrival of a few cars of first cutting alfalfa had a tendency of weakening all prices and preventing trading in any quantity. Although no new grain hay is available new volunteer will probably be on the market in a few days at prices very much under rates prevailing heretofore. New volunteer and new barley hay has been sold in small quantities at from 9.00 to 11.00 per ton at shipping points in the country, mainly for local consumption.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00

Citrus Markets

Los Angeles, May 18, 1921.

While the shipping of Navels is practically ended they still dominate in the auctions and many other markets and are closing the season with very satisfactory prices. Valencias are coming in with exceptional quality, are running somewhat larger than the Navel. F. o. b. quotations are running around $3.00 to $3.25.
New York took a spurt on lemons and reports high average at $5.20 on one day's sale. The lowest average on any one lot on the 17th was $3.50.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 22,155 cars; lemons, 4,705; total, 26,860. To same date last season: Oranges,18,309; lemons, 3,680; total, 21,989. From Central California to date this season: Oranges, 5,757; lemons, 137; total, 5,894. To same date last season: Oranges, 5,147; lemons, 287; total, 5,434. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261, lemons, 22; total, 283.

WHICH

Why Lose the Other 20 Dozen?

Uncle Sam has counted the hens on the ranches and farms in this country, also the number of eggs that farm-raised hens lay in 12 months' time—it is 69.

Compare this with the returns in eggs, per hen, from the properly fed, bred, and housed hens here in Southern California, where records of 310 eggs per hen per year are an actual fact, established, not merely by one single hen, but by several hens, all with actual trap nest records for every day in the year.

These as well as more than one-half million OTHER HENS in Southern California, are fed each and every day in the year on

PCA Poultry Food

exclusively. And it is to the PCA BRAND OF POULTRY FEEDS manufactured and marketed exclusively by the Poultrymen's Co-Operative Milling Association of Los Angeles that much credit is due for these wonderful egg records.

PCA Poultry Feed is nothing but pure grains, properly cracked, ground and so blended with the added protein as to make the ONE correctly balanced and mixed ration to produce maximum egg yield.

PCA Poultry Feed

costs no more than clean, unadulterated feeds should cost. They are really CHEAPER in the long run, for the hens do not require as much PCA DRY MASH as of other makes to obtain the same required amount of protein and other egg-building material.

Ask your dealer for PCA EGG MASH, PCA DRY MASH—with buttermilk—PCA SCRATCH FEED, PCA CHICK MASH—with buttermilk—or with egg PCA CHICK FEED, PCA GROWING SCRATCH, etc. Do not accept something offered as being "Just as Good."

Phone or write us and we will see that delivery is made to you QUICKLY for the GENUINE PCA PRODUCTS.

200 Gallons of Cool Fresh Water for One Cent
AND UNDER A HEAVY PRESSURE, AT THAT

Wouldn't you enjoy having plenty of water in all parts of the house and barn every minute of both day and night? Nice clean, fresh water, always cool,—coming direct from the well—free from dust and dirt, without being heated by the sun, and with a CONSTANT PRESSURE more than enough to drown out a possible fire,—to hose off the sidewalks, porches and windows, or to drench both lawn and garden?

With a Sentinel Automatic Water Pressure System you have all these advantages,—yes, and many more. No big tank and stand to put up, no unsightly and expensive frame or tower to erect,—yet ALWAYS, plenty of water with a pressure equal to that from a tank from 80 to 120 feet high,—and even more if you need it.

And this powerful, modern **Sentinel Automatic Water Pressure System**,—simple, yet surprisingly efficient, is AUTOMATIC,—starts itself, runs itself and stops itself. No fuss, no bother,—just tuck it away under the house, back of the house, in the garage or barn, except for an occasional filling of the oil reservoir,—forget it.
The **Sentinel Automatic Water Pressure System** is such a SAFEGUARD to your home and family, so serviceable, practical and convenient and yet so reasonable in cost and operation that you will be intensely interested in our detailed description and guarantee. Write or wire us TODAY.

Sentinel Automatic Water Pressure Systems for Country Homes.

Constant Pressure Economical Convenient

The Inner Secret of making GOOD Bread

THE first essential for perfect bread is a *good flour;* one which has been properly tested for its bread-making qualities before it reaches you—a flour that is *always the same.* Every sack of Sperry Drifted Snow Flour has been put through this test.

To keep the dough from cooling, mix and knead it quickly. In cool weather the bowl containing the dough may be set in a pan of warm water. The longer the batter is beaten, the less kneading the dough will require. When dough can be lifted in a mass on a spoon, it is ready to knead.

Dough is kneaded to mix the ingredients thoroughly; to make the gluten elastic and to work in the air. It is sufficiently kneaded when it can be left on the board for a minute or more without sticking. Dough containing large bubbles has risen too long or too fast. It should be cut down and rekneaded to distribute the gas evenly.

Always make small loaves to insure bread being baked through; in large loaves the heat may fail to penetrate to the center of the loaf.

If bread rises much after being put in the oven, the heat is not great enough, but if it begins to brown in less than fifteen minutes, the heat is too great. During the first ten minutes the loaves are in the oven they should merely rise and perhaps begin to show a little brown in spots; in the second period of ten minutes they should become a delicate brown all over the surface and cease to rise; in the third period they should finish browning, and in the fourth they should shrink slightly from the pans. After the first ten minutes the oven heat can be decreased slightly, and as baking continues, it may be lessened still more.

When baking is completed, the loaves will give forth a hollow sound when tapped, and will shrink from the pan. After baking, remove bread at once from the pans and allow to cool in fresh air, uncovered. Do not put away until perfectly cold. Here's the recipe:

Sperry Drifted Snow Bread

1 cup water or milk, scalded; 1 tablespoon melted shortening; 1 tablespoon sugar; ½ yeast cake dissolved in ¼ cup lukewarm water; between 3 and 4 cups of Sperry Drifted Snow Flour.

Put shortening, sugar and salt in hot milk, let stand until lukewarm, then add dissolved yeast and flour gradually, beating well until too stiff to stir. Turn on moulding board and knead in remaining flour until mixture is smooth. Place in well-greased bowl, brush dough over with melted shortening, cover and allow to rise in a warm place to twice its original bulk; then turn on board, knead and shape into loaves. Place in greased pans, having them about half full. Brush over loaves with melted shortening, let rise again and bake in a hot oven about 45 minutes for a medium-sized loaf.

NOTE: All measurements are level and flour is sifted once before measuring. A half-pint measuring cup is used.

UNIVERSITY OF ... JUN ... 1921

In Memory of Our Patriot Dead

In the National Cemetery at Chattanooga, Tennessee

"Low green tents whose flaps never outward swing" in a small portion of a section dedicated to the unknown dead gathered from various battlefields in southern Tennessee. There are over 13,000 graves in this one cemetery, about one-third of which are of unknown dead. The grave marker in the case of those which were known is a plain white marble slab standing some 18 inches above the sward and perhaps 14 inches across the face with simply the number, the soldier's name and the state from which he enlisted. More complete records are kept in the keeper's lodge. The unknown are marked, however, as may be seen in this illustration with a square piece of marble with simply a number on the top. This photograph was taken by Mr. Messenger in 1885. A grateful nation has never lessened its care and attention to these last resting places of the veterans of the Civil War. Every one of these graves is decorated with flag and flower on May 30.

Lincoln's Address at Gettysburg Cemetery

FOURSCORE and seven years ago our fathers brought forth upon this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal. Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of that field as a final resting-place for those who gave their lives that that nation might live.

It is altogether fitting and proper that we should do this. But in a larger sense we cannot dedicate, we cannot consecrate, we cannot hallow, this ground. The brave men, living and dead, who struggled here have consecrated it far above our power to add or detract. The world will little note, nor long remember, what we say here, but it can never forget what they did here. It is for us, the living, rather to be dedicated here to the unfinished work which those who fought here have thus far so nobly advanced.

It is rather for us to be here dedicated to the great task remaining before us, that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion: that we here highly resolve that these dead shall not have died in vain: that this nation, under God, shall have a new birth of freedom, and that government of the people, by the people and for the people shall not perish from the earth.

The President Opens Valencia Show

By Ernest Braunton

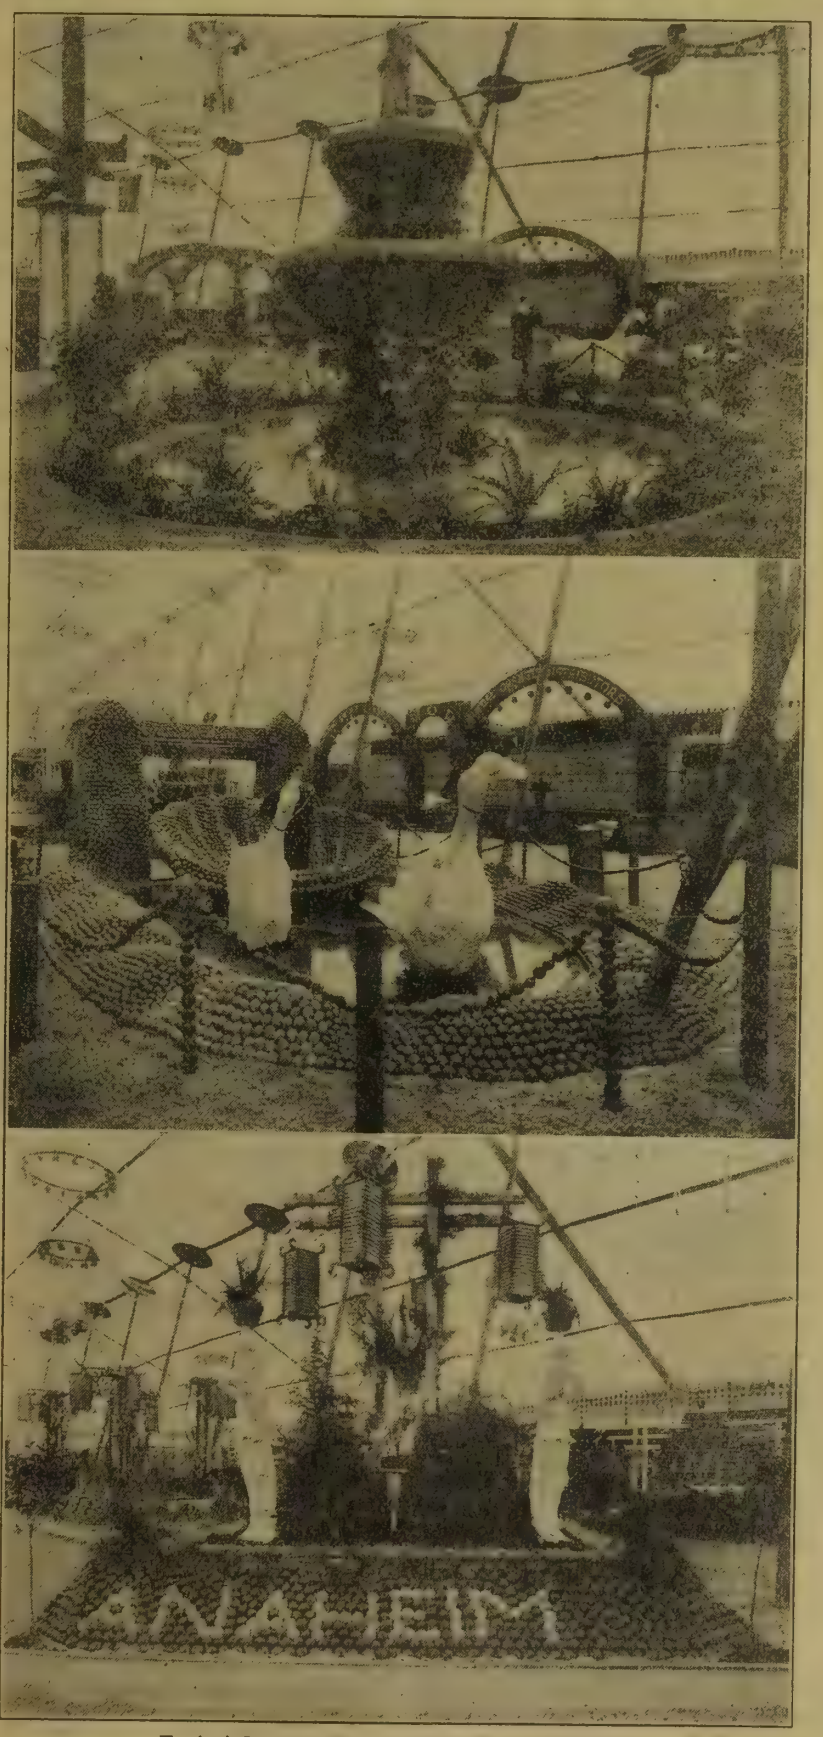
PRESIDENT HARDING was paid for opening the California Valencia Orange Show at Anaheim on May 17. A box of the choicest prize winning Valencias was promised him by C. C. Chapman, honorary president of the show, upon President Harding's formal opening words over the 4,000 mile long wire that connected the White House and the huge tent that covered trainloads of golden fruits. The special box was packed at the show by the president's sister, Mrs. E. E. Remsberg of Santa Ana. While the management was proud of have our chief executive perform the service and send warm greetings of love to California, President Harding would have felt honored could he have seen this great exhibit, for it was "some show."

Promptly at ten o'clock Tuesday morning President Harding, sitting in his office in the White House, spoke the words that formally launched the first annual California Valencia Orange Show. Sixty persons prominent throughout the Southland, including the president's sister, were seated at a long table at the show with telephone receivers glued to their ears and heard the president's words as plainly as though he had been standing before them. C. C. Chapman was spokesman and after the formal and necessary "Hellos," said: "I am delighted, Mr. President, to have the honor of this unique introduction across the continent. We shall appreciate it if you will now officially open the California Valencia Orange Show by addressing us, after which I desire to say a few words."

After the formal opening Mr. Chapman had a chat with the president, thanking him for the honor, inviting him to California, ending with other diplomatic utterances such as "C. C." deals out on every such occasion when his services are available and of which he has an inexhaustible supply. It drew from President Harding the following response:

"I thank you, Mr. Chapman, very much. It is a great pleasure to me to send greetings to the wonderful state of California through the modern ways of long distance telephone system. I have had great pleasure in reading the invitations received a few days ago on the occasion of the opening of the first California Valencia Orange Exposition, and I am complying with the invitation with very great satisfaction. You Californians have been pioneers in all the enterprises that go out to capitalize the resources of the country. With your supreme confidence you have followed and successfully developed the markets everywhere of the most splendid fruits found anywhere. You have given us the incentive to develop our great possibilities in selling, financing and managing. I wish you and your exposition the greatest success that this enterprise deserves. I wish that I might be there. It would be a personal pleasure, for I know how wonderfully you do things, and hope to be in California during the present term. I thank you very much. If I only could come to the Pacific Coast this year, as I hope to, I will certainly take in all California that is possible."

The first thing that struck the visitor was the great size of the show. The writer had not expected such a large display. The next strongest point was the arrangement. It is safe to say no other orange show in California could so nearly be seen in its entirety as one entered the portals. This was a triumph in arrangement for which the management deserves great credit. The displays were numerous and some of them of great size. That of the American Fruit Growers, Inc., would in itself make a citrus show, for in addition to hundreds of boxes of fruits from every county in the Southland, they had the first prize feature display. An arched background composed of fruits had as a "forescape" a placid lake banked with green and golden fruits and in its midst a floating shell shaped barque bearing a life size wax figure of a woman holding the reins over three "blue geese" five feet high. It was a large, striking exhibit of most unusual attractiveness. As a result of the size of the exhibit and the excellence of the fruits this company captured a majority of the blue ribbons. Blue ribbons and blue geese harmonize grandly.



Typical Scenes at the Anaheim Valencia Show

Upper photo shows electrical fountain at main entrance; middle, American Fruit Growers blue ribbon winning feature exhibit; bottom, city of Anaheim feature display.—Photos by Cochems.

Next to citrus fruits the avocados were the major attraction, the first really commercial exhibit of avocados seen in California. Four growers had large displays: E. E. Knight, J. T. Whedon, Earl D. Gage and C. P. Taft, the latter also showing several named varieties of loquats. Other avocados were from Sherman Stevens, F. De Witt Smith and W. H. Sallmon, the latter sending a commercially packed box of four trays of Dickinson from Chula Vista, San Diego County.

Various farm machinery firms had displays on hand as usual. One new tractor (in name at least) was noted, and a new orchard cultivator of unusual promise, one that interested the orchardists present. The scheme for this new departure was hatched at Claremont, so it is strictly a "home brew." Several well known brands of fertilizers were present, in addition to the "prehistoric lime" from Torrance about which we have heard so much through the newspapers. In this booth were two large glass cases filled with bones from the age-old deposits, some presumed to be of prehistoric man. This "D. M. S." booth was in charge of Sexton and son, and the writer could not refrain from telling Fred Sexton that it was peculiarly fitting that sextons should have charge of the bones of the departed. The howlers for "hot dogs" and other refreshments had booths at every turn and with amusement and music booths in full operation it was a veritable canvas covered Coney Island. The whole show tended to keep visitors, old and young, interested during their every minute. The list of prize winners is here given:

Class No. 1, Sweepstakes, for the best 24 boxes of Valencia oranges—First, cup and $75 cash, won by the American Fruit Growers, Inc., of Fullerton: second award, certificate and $40 cash, won by the American Fruit Growers, Inc., of Yorba; third award, certificate and $20 cash, won by the Santiago Orange Growers Association of Orange.

Class No. 2, Sweepstakes, for the best 24 boxes of lemons—First, cup and $50 cash, won by the American Fruit Growers, Inc., of Fullerton.

Class No. 3, Sweepstakes, for the best and most artistic display of 12 boxes of seedless grapefruit—First, cup and $50 cash, won by the American Fruit Growers, Inc., of San Fernando.

Class No. 4, for the most artistic rack display of Valencia oranges, 40 boxes or more—First, cup and $25 cash, won by the Mutual Orange Distributors of Redlands; second award, certificate and $15 cash, won by the Anaheim Orange and Lemon Association of Anaheim; third award, certificate and $10 cash, won by the American Fruit Growers, Inc., of Fullerton.

Class No. 5, for the most artistic rack display of lemons, 40 boxes or more, regardless of variety or kind—First, cup and $25 cash, won by the American Fruit Growers, Inc., of Fullerton.

Class No. 6, for the best 12 boxes of Valencia oranges—First, $50 cash, won by the Anaheim Orange and Lemon Association of Anaheim; second, $25 cash, won by the Santiago Orange Growers Association of Orange; third, $10 cash, won by the Garden Grove Citrus Association of Garden Grove.

Class No. 6 (special), for the best 12 boxes of Valencia oranges entered by

Agricultural News Notes of the Pacific Coast

Northern California

Glenn County has 1,021 acres of olives.

The Fresno district fair will be held September 26 to October 1.

Hayward, Alameda County, will hold a big farm products show, August 11-14.

Two carloads of young trout are being planted in the streams of Butte County.

During April there were 1,353,693 chicks hatched at Petaluma, Sonoma County.

Yuba City, Sutter County, is letting contracts for the paving of streets in 28 city blocks.

Plans have been made for a Colusa County fair in September, to be held at Arbuckle.

The next farm bureau auction for Stanislaus County will be held at Modesto, May 31.

Santa Rosa, Sonoma County, has a hen's egg which measures eight inches each way around.

Glenn County farmers formerly growing rice only have this year planted heavily to corn.

Six hundred tons of prunes were shipped from Chico, Butte County, to Germany last week.

Cherries are being shipped from Newcastle, Placer County, at the rate of a car each day.

One hundred thousand cuttings of seedless grapes have been planted at Loma Rica, Yuba County.

Stanislaus County is planting heavily of sorghum and a new syrup plant has been erected at Turlock.

One day last week San Francisco held in storage 127,727 cases of eggs; same date last year, 104,992.

The Sebastopol Apple Growers Association, Sonoma County, report a 40 per cent drop of young fruit.

Rice fields in Glenn, Colusa and Tehama Counties aggregate about 90 per cent of the acreage planted last year.

The American relief administration has purchased 600 tons of Colusa and Glenn rice to be shipped to the starving Far East.

Dr. J. C. Whitten, from the University of California, has been investigating the strange death of fruit trees in Butte County.

The heaviest yielding fig orchard in the state is said to be owned and managed by a woman, Mrs. Birdie Hatch of Merced.

From Greenville, Plumas County, come reports that orchards in that county were not injured by late frosts and heavy fruit crops are expected.

At the end of the twenty-eighth week of the Petaluma egg laying contest the best record hen, owned by C. C. Boyson, had laid 155 eggs in 196 days.

Sour sap, owing to a mild winter and consequent lack of dormancy, with a cold spring, has killed thousands of fruit trees in Tehama and adjoining counties. Lime is being used.

Governor Stephens has issued a proclamation declaring the week of May 22 to May 28 Fire Prevention and Forest Protection Week, which is of especial value to northern counties with grazing ranges.

Central California

The new Modesto creamery is nearly completed.

Modesto shipped its first carload of soap east on May 10.

Porterville, Tulare County, is to have a new fig packing plant.

Oakdale, Stanislaus County, has struck oil in the first well drilled.

Prime hogs brought from $8.30 to $8.75 at last week's sales in Tulare.

Oakdale, Stanislaus County, is to have an official city planning commission.

Earlmart, Tulare County, is becoming an egg center; 47 cars left there one day.

Merced has a pullet that laid its first egg at five days less than four months old. Next!

The total output of Valencia oranges in Tulare County for 1921 is estimated at 1,500 cars.

Lindsay reports five-sixths of the oranges of Tulare County are shipped from that point.

Watsonville, Santa Cruz County, recently sent a full trainload of vinegar to eastern points.

The Durham state land settlement is to have a 20 acre recreation park and community center.

Porterville, Tulare County, has opened to the traveling public an improved commodious automobile park.

Poultrymen at Porterville, Tulare County, organized a poultrymen's association, with 56 charter members.

A four story 100 room hotel will be erected in Tulare, under the supervision of the Tulare board of trade.

The membership drive for the Stanislaus County farm bureau netted over 700 members last month.

Packing house employes at Lindsay, Tulare County, are all working overtime on shipping Valencia oranges.

The first 1921 box of fresh figs from Fresno sold in San Francisco in May for more than 36 cents for each fig.

Stanislaus County has a new stretch of railroad built to carry materials for the great Don Pedro dam about to be built.

The weather observer at Fresno states that April weather was the most unfavorable to agriculture for ten years.

Twenty certificates of birth of Japanese children in one block of Fresno's Oriental section were issued last month.

The planting of Blackeye beans in Stanislaus County is so heavy that local seed supplies have been exhausted.

Fire destroyed the Caruthers plant of the San Joaquin Valley Milk Producers Association on May 17. Loss $55,000.

The fruit men of the San Joaquin Valley met at Fresno last week and decided upon a ten per cent cut on farm wages.

The state agricultural department says the late frosts cut down the grape crop of the San Joaquin Valley about 30 per cent.

An advertising campaign with a fund of $50,000 was practically decided on during the week end gathering of San Joaquin Valley commercial secretaries. Publicity will be sought throughout the east to attract new residents and visitors to the valley.

Southern California

Ventura County has perfected plans for a county fair this fall.

Imperial Valley is shipping tomatoes at the rate of ten carloads a day.

The Ojai Valley, Ventura County, is now gathering its largest orange crop.

The first carload of cantaloupes from Imperial Valley were shipped on May 21.

The first watermelons were shipped from Calipatria, Imperial County, May 21.

The Imperial Valley shipped its first crate of blackberries May 12; first in history.

Oxnard, Ventura County, reported all bean planting finished just before the big rain.

The Moorpark Memorial Union High School, Ventura County, will be dedicated May 30.

Imperial County will pay cantaloupe inspector $8 a day, an increase of 50 cents over 1920.

Santa Ana has a toy factory part of each year, when the house is not making vegetable crates.

Ventura has a new town on the map and on the railroad, called Wadstrom, an oil shipping center.

San Diego County has just closed a long series of vineyard demonstrations under Prof. F. T. Bioletti.

San Bernardino County introduced its first oil well last week. It is a 500 barrel producer near Chino.

The Orange County farm bureau dairy department will hold a picnic at Orange County Park June 18.

H. M. Houser, Covina, raises big crops of cherries and claims the only lack in the south is cross pollination.

J. O. Shuey of Yucaipa, San Bernardino County, recently bought 2,000 White Leghorn chicks in San Gabriel.

The State Sunday School Association will hold its annual convention in Anaheim, Orange County, in October.

On the last day counted there were 115,582 cases of eggs stored in Los Angeles. Same date last year, 45,624 cases.

Horticultural Commissioner Waite of Imperial County reports the present canteloupe crop as the largest yet grown.

Orange County beet growers state the late rains have proved a great benefit to them; the yield will be above normal.

The world famous pianist, Paderewski, will meet with the Orange County Historical Society at the Modjeska ranch, May 28.

Anaheim, Orange County, has had the heaviest year of building in its history. The permits totaled more than a million dollars.

This week the largest graduating class of Indians from the Sherman Institute at Riverside faces the world. They number 35, from 15 different tribes.

The making of charcoal from walnut shells has developed into a sizable industry in Southern California. This charcoal is an ingredient of many chicken and hog mashes.

During April, Imperial County shipped 7,875 crates of tomatoes, 9,762 crates squash, 2,100 crates strawberries, 400 sacks peas, 160 sacks beans, 3,100 crates and 33 carloads asparagus.

The Coast and General

During the past six months Seattle has shipped 215 carloads of eggs.

Sixteen hens in the United States, all of them white, have laid over 300 eggs each during the past year and are entered in the select class of the egg laying league.

Several of the famous gold mines of Mohave County, Arizona, which have been idle for several years, are now being again opened and are producing gold ore.

Post office receipts at Phoenix, Arizona, for the first four months of 1921 show a substantial increase in spite of the business depression. The rate of decrease throughout the country is 8.24 per cent.

The state school fund of Arizona, totaling $536,841.90, has been apportioned among the 14 counties. Under the new law the future appropriations will be made according to the total attendance rather than upon the school census.

Thirty-one lumber mills in Arizona cut 121,160,000 board feet of lumber during 1920. Five of these mills cut 95 per cent of the total. The 1920 cut exceeds that of 1917 or 1918; the 1919 figures being withheld to be given later by the census bureau.

The supreme court of Arizona has held that the law providing for the tax on migratory flocks of sheep as well as goats, bands of horses and herds of cattle is invalid. This law provided 25 cents per head on sheep and goats and 50 cents on cattle and horses owned by non-residents.

Reports show that the rain and snowfall have been heavy in north central portions of Arizona, eight inches of snow and a half inch of rain falling at Flagstaff. This puts the ground in excellent condition for farming and relieved the water shortage on the ranges in that section.

The new Globe-Miami Highway, a state road which connects Phoenix with the mining towns of Globe and Miami, is a shorter route and was opened temporarily when the first car with the state engineer and party went over it May 12. The road will be formally opened for public travel this fall.

E. H. Crabb, president of the Arizona Cattle Growers Association, has just returned from the Northwest and advises that pasture is available for 500,000 head of cattle in Montana and Wyoming. Efforts are being made to work out some cooperative scheme whereby Arizona cattle may be fed in these states. It appears that cattle on the Arizona ranges are suffering from lack of food, while the abundance of feed in the Northwest will go to waste if it is not utilized.

L. M. Harrison, statistician of the department of agriculture for Arizona, gives out the information that there will be almost a total failure of the peach crop in Yavapai, Apache, Gila, Cochise and Santa Cruz counties. The Yuma County peach crop will be about normal and Maricopa County about 70 per cent of normal. About 50 per cent of the normal apple crop is expected in Yavapai and Santa Cruz Counties. In Cochise County the crop will be 25 per cent of normal. In Apache and Navajo Counties it will be almost a total failure.

Controlling Red Spider in Deciduous Orchards

By E. R. de Ong

THE demands for information regarding the progress of experiments on red spider control inaugurated in 1919 have led to the publication of this paper, which must be considered in the nature of a progress report, and recommendations herein made may consequently be altered by further investigations. The work has been conducted cooperatively with the division of pomology at the university farm, Davis, and in private orchards in Yolo, Sutter and Butte Counties.

There are three distinct species of plant mites, commonly called "red spiders," which are serious horticultural pests. They are: the common red spider, also known as the summer red spider, the two-spotted and the six-spotted mite, found chiefly on the prune, plum, almond and peach during midsummer; the brown mite, also known as the almond mite, which is common on the almond and prune in the spring and early summer; and the citrus red spider, a citrus pest but occasionally found on certain deciduous trees.

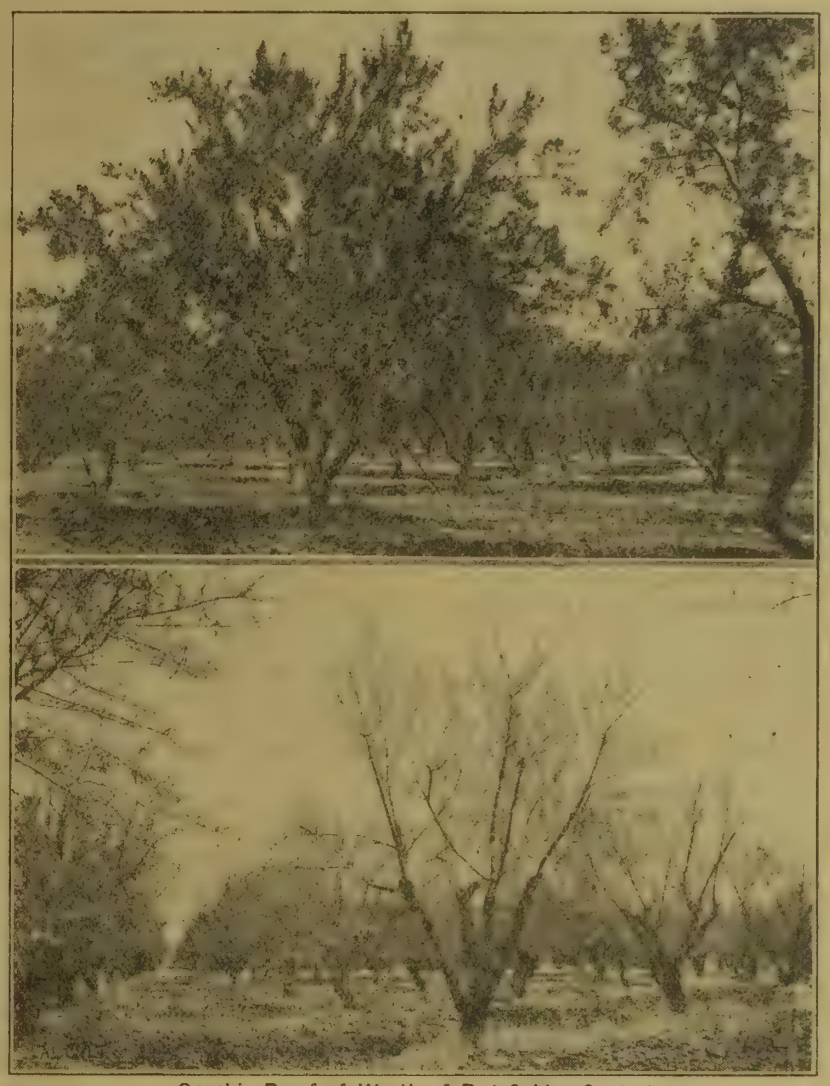
Red Spider

The common red spider (two-spotted mite or six-spotted mite) overwinters in the adult and nymph stage among leaves, in the soil or on the hardy plants such as wild morning glory and the cheese weed (mallow). After these plants have matured in the spring or summer or have been killed by the mite the latter migrates to orchard trees or other hosts where it may feed until fall.

This species of red spider feeds mostly on the under side of the leaf, spinning a noticeable amount of web. The eggs, invisible unless magnified, are scattered on the under side of the leaf or in the web, appearing at first colorless but at hatching time a faint color appears. The young mite is almost transparent while the adult is usually a greenish yellow, with one large or three small dark spots on each side of the body.

Citrus Red Spider

The mite is occasionally found on deciduous trees during the summer. It also spins a web but not in such quantities as the common red spider. The egg is a deep red and found on the leaf surface. This mite is a deep scarlet, with prominent spines arising from tubercles.



Graphic Proof of Worth of Red Spider Control

Upper picture shows almond trees where the red spider was controlled by spraying. Lower: almond trees defoliated by the combined results of drouth and red spider attack.

Brown Mite

This species is not a web spinner. It usually congregates along the leaf scars of the twigs through the day, while the other two species are found almost exclusively upon the blade of the leaf. The winter is spent in the egg stage on the older twigs and fruit spurs. There is no distinct migration from one host to another as with the common red spider, the entire year being spent on the same host. The egg is deep red, the young mite bright scarlet, and the adult reddish brown, usually showing a greenish tinge. The first pair of legs is decidedly longer than the other three pairs.

During the process of feeding the red spider extracts the chlorophyll (the green coloring matter of the leaf) as well as the sap from the leaves. This causes first a mottled appearance and finally a paling of the entire leaf surface and frequently defoliation. Trees so injured cannot produce sufficient starch and sugar to mature a normal number of buds for the coming year or those that are set may be weak.

Preventive and Control Measures

Kill out the winter growing weeds, such as wild morning glory and mallow (cheese weed), upon which the mite propagates in the early spring. Plow under such plants before they mature or are killed by red spider, for the latter then migrate to the orchard. Cover crops such as bur clover, peas, vetches and grains are not known to harbor the red spider and should be grown where practicable.

Keep the orchard as thrifty as possible, irrigate before the trees show any sign of suffering from drouth.

In regions where red spider injury is common, apply sulphur to the trees at the time when the attack usually

(Continued on Page 708.)

Avocado Registration Committee Reports

In order to determine the value of the various varieties of avocados the association has a standing committee whose duty is to secure chemical analyses, make records of bearing ability, hardiness, flavor, and general marketable qualities. A number of varieties were placed on the accepted list, later reduced to five: Spinks, Fuerte, Sharpless, Dickinson and Puebla. This list was not changed by the following report which was made at the annual convention in Pasadena. However, the committee gives valuable suggestions in its report which follows:

NUMEROUS requests have reached the committee to mention a variety of the Mexican race of avocados, equally hardy with the orange, that would be satisfactory for home use in dooryard planting in places where it would be too cold to raise the Guatemalan varieties. The Ganter has stood this test well for a number of years. The tree is vigorous, precocious and productive. The fruit is one of the largest of the Mexican type, averaging half a pound in weight, of a green color and in quality and flavor extremely good. Its defect, of a frequent cracking or decay spot at the blossom end, does not interfere with its home use and can be largely prevented if the fruit is not allowed to remain on the tree after it reaches maturity.

There has been expressed a desire for the discovery of a larger good Mexican fruit than those with which we are familiar in California. Such an one came into bearing last fall, producing a handsome fruit weighing a pound, black in color and of very fine flavor. It is growing in a frost free location, so we can only assume, until tested elsewhere, that it will be exceptionally hardy, like the other Mexican kinds. It is believed to be identical with the Gottfried introduced by the U. S. government into Florida some years ago. This tree is growing on the Spinks place, where he has also under observation a seedling of the Mexican race, which he has named the "Mission" and which produces a fruit equally fine in flavor and nearly as large in size. It is pyriform in shape, black in color, with a moderately sized seed, tight in the seed cavity, clear yellow flesh and no fiber.

It is a surprise and pleasure to learn in how many places and to what an extent Guatemalan seedlings are being grown with the hope of finding fruit of value to the industry. There are three separate places in each of which over a hundred such trees are under care and observation, besides numerous others having more or less trees under similar care. We are getting good results, as our report will show. In addition we have a sure gain to the industry from the fruiting this year in California of 12 out of 24 Wilson Popenoe introductions through the U. S. government from Guatemala.

On the invitation of Mr. Spinks, the varieties committee, by its three active members, assisted him on April 24 in picking and verifying the identity of these varieties, preparatory to his exhibiting them and cutting them at this meeting. All were sufficiently advanced to show that they correspond superficially to the government description, although only one, the Kanola, has matured here and been tested. The others are named as follows: Nimlioh, Benik, Mayapan, Cabnal, Ishim, Manik, Lamat, Cantel, Pankay, Ishkal, Tertoh. The Kanola is a heavy bearer of a round deep purple fruit, six to ten ounces in weight, with a very thick rough skin, a small seed and yellow flesh of rich flavor. A sample of this fruit from Mr. Shedden's place, submitted to Messrs. Chace and Church on March 24 for analysis, gave the following result: Total weight of fruit, 220 grams, approximately 7¾ ounces; percentage of pulp or edible matter, 63.6 ounces; percentage seed, 12.3; percentage skin, 23.7; percentage water, 70.22; percentage fat, 21.92; percentage protein, 0.96; percentage total sugars, 0.49; percentage ash, 1.32.

Of the sedlings that have come into bearing on the Spinks place five are considered especially promising, all having fruit from a pound to a pound and a half in weight. The one considered the most interesting has been named the "Alexandria." This fruit proved very fine in quality and flavor with a very small seed and the tree a strong grower.

Among a good many on the Huntington Estate, No. 46 is the most interesting, having very rich fruit.

On the Oakley place at Brentwood Park are a number of fine flavored Mexicans and Nos. 1, 2, 3 and 4 the more prominent among his Guatemalans.

On the Stevens place at Montebello his Nos. 1 and 2 test out well. At his place and also at La Habra and Whittier the No. 15 introduction of Stevens and Rideout has been on trial for several years, producing a fruit of extra fine, rich, nutty flavor, but too many of the fruits have the undesirable crooked, curved neck and the tree is too long in coming into bearing. The value of their introduction No. 2 is still undetermined.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Of all the days observed in honor of the great and the true none are more sacred than is Memorial Day, which we observe next Monday. Established soon after the Civil War in honor of the heroes of that war it has become a day generally observed in honor of all our heroic dead. The time was when the day was all too much given to sports and hilarious proceedings. This spirit has not entirely passed but the day is generally considered one of our most holy days.

* * *

The boys are coming home. On Tuesday one of the great transports which had carried the boys over there returned with several thousand. They had made the great adventure and had given their lives for freedom in America and in all the world. It is fitting that at this memorial time these boys should be returned to their native land.

* * *

The federal reserve bank has estimated that 50 billions of dollars annually is paid by employers to wage earners. Forty of those 50 billions is required for living expenses of the laborers and their families. This leaves ten billions excess income. Owing to the great need of the country for electrical development and general commercial advancement the bank appeals to these laborers to place these funds at the service of the government, and all the people, by investing in government or other securities. One may now invest in government securities in any sum from 25 cents to an unlimited amount. However, the lowest interest drawing security issued by the government is the $5 war savings stamp. The 25 cent thrift stamp and $1 treasury stamp are for the purpose of exchange for the interest bearing security.

* * *

Southern farm papers are appealing for a reduction in the cotton output. "Everybody admits that an 8,000,000 bale crop of cotton this year will bring just as much money as a 12,000,000 bale crop. What, then, is the sense of planting, chopping, nurturing, picking and ginning 4,000,000 extra bales of cotton for nothing?" "In Heaven's name, let's plant only just enough cotton this year to pay taxes and absolutely necessary store bills and plant every other acre in food crops, feed crops, soil improving crops, gardens, pastures, orchards, watermelons and potatoes. Let's live well at home—with home made bread, meat, milk, butter, vegetables, fruits, chickens, eggs, watermelons, syrup and honey—and absolutely refuse to ruin prices of 1921 cotton and of cotton already on hand by planting, cultivating and picking 4,000,000 extra bales of cotton for nothing."

* * *

Railway people and commercial people generally have felt that the farmer was unduly concerned in this price reduction. "We are all hit with the same club, let's cheer up and be sweet." However, Herbert Hoover has made some investigations and he has called attention to the unequal progress in the various steps in the economic readjustment. Here are a few of his typical indexed numbers, 100 being 1913. Farm crop prices in 1921 are almost back to normal, being 115; farm meat animals are slightly better, 123; wholesale index — wholesale, mind—on all commodities, 162; railway rates, 166; building trade wages, 177; clothing, 192; fuel and light, 207; building materials, 212; house furnishings, 275. This disproportion of levels is what is causing discouragement and loss in nearly all agricultural lines.

* * *

The state convention of the California State Irrigation Association, is being held in Sacramento this week. The association is boosting and working for the great irrigation and power development plan which covers the northern and central portions of the state. The association members realize the stored up wealth which will be possible if enough people with vision may be brought to the position of looking into the Sierra Nevadas and then of voting for a state bond issue of two or three hundred millions with which to store the floods.

* * *

The percentage of the country's population which is engaged in farming has decreased from 87.1, which it was in 1820, to 32.9 per cent in 1910. In 1840 the percentage was 77.5; 1870, 47.5; 1880, 44.4; 1890, 39.2; 1900, 35.7. It is anticipated that the present census may show close to 30 per cent of the population as employed in agriculture.

* * *

It has been observed that young people may enjoy a trip to town over poor roads, but it is sometimes hard to get them to go home over the same roads. A farm that is ten miles out may halve the distance by good roads construction.

FREIGHTS REDUCED

Railways announce reductions of freight rates on certain commodities approximating 20 per cent on all transcontinental railways west of Chicago. This applies to only Pacific Coast terminals and is to meet water competition. "The new Eastbound rates will apply to beans, peas, canned salmon, canned goods, condensed milk," and some other commodities, but we understand citrus fruits are excluded.

FREAK RAIN

California's dry season has been put entirely out of joint by heavy rainstorm over the entire state. Humboldt and extreme northern counties received only comparatively light fall but the southern end of the state reversed the usual order of things and took to itself a precipitation ranging from one to 6.16 inches. Producing sections such as Santa Barbara received a precipitation of 1.46; Riverside, 1.6; San Diego, 1.15; Pasadena, 3.76; Long Beach, 2.09; Sierra Madre, 4.08; Santa Monica, 3.90; Pomona, 3.20; Palomar, 6.16; Anaheim, 3.26. But little alfalfa hay was caught, although a large quantity of grain hay has been seriously injured. Some estimate the injury as great as 100 per cent, at least 50 per cent of the crops being cut.

The storm was not of the April shower or thunder shower type but a regular continuous midwinter rain. The storm has broken all May records of precipitation.

SALES TAX

The excess profits tax is yielding large income to the government and is drawn from only those who have. It was claimed at one time that the profiteer only added that much more to his prices and passed on his excess to the consumer. That was true, then. It isn't so easy to add to prices today. The buyer has more to say than he had at one time. Ultimately the excess profits will fall exactly where they belong.

Hence fun in congress. "Repeal the tax and give us the sales tax." Take it off of those who have and put it on those who have not. The Federal Farm Bureau, the Grange, and nearly all of us, are speaking out in meeting. The Grange has issued a statement from which we quote:

"Sales tax fight is on. A fight to shift a billion and a half dollars of federal taxes from those best able to pay to those least able to pay is going on in congress. This is what the sales tax means. The ability and cunning with which the propaganda in favor of the sales tax is being spread through the press of the country makes it necessary that some clear statements of the real facts should be printed so that these facts may not be lost sight of.

"The fight at this time is centered in an effort to pass the Smoot Bill, which is a very carefully drawn measure providing for a tax of one per cent on every commodity turnover with a few exceptions. That is, when a farmer sells his wheat or hogs or milk, he is liable for only one per cent tax on what he gets. When the elevator, or a packing house or a creamery sells its product, they must pay one per cent tax. When the commission man, or the miller, or the wholesaler, or the retailer passes the product on, each must pay a one per cent tax.

"The theory of the tax is that each vendor will add the tax to the selling price so that it accumulates along with the other costs of doing business, until the consumers pay it all, which theory might work out if the price were established by the seller. The Smoot Bill is clever because nothing in this bill provides for the repeal of the higher income taxes and the excess profits taxes, but the simplest analysis of the bill shows that there is no possible reason for attempting to collect a billion and a half dollars sales tax unless it is also proposed to repeal these taxes, and of course that is the real reason for the tax fight. It is a plain question of somebody trying to escape their big taxes and unloading them on the whole public as consumption taxes."

It is possible our concern is without cause, for at the last moment comes dispatch from Washington, "Sales tax ditched. Proponents abandon hope. Union labor joins farmers in protest."

FIGHT ON DAIRYMEN

Some years since clubwomen and others of the city of Los Angeles put up a fight for higher milk quality. The sins of the careless dairyman and spread of disease from insanitary conditions were played up to a finish. New milk laws were enacted, a corps of inspectors and officials were put on the job and milk quality rose. This matter of milk quality has given to Los Angeles the reputation, as reported by the United States department of agriculture, for highest quality of milk of any city of its size in the world. The dairy restrictions were so rigid that many dairies unable to finance required improvements quit the game. The improved conditions required greater production expense. War prices caused other increase and milk prices advanced till the price of 18 cents for pasteurized was paid by the consumer. A recent cut to 16 cents was made by delivery men.

Now comes agitation for still further reduced prices. Club women, the mayor, the district attorney — everybody, almost—is "probing" and "children are dying" as a result of the "dairymen's greed." The club woman whose husband has perhaps grown rich farming the farmer has great pleasure in this "dairyman's greed" business.

But if Los Angeles is wise it will consider some things:

Los Angeles has the purest milk in the world! A statement not simply bunkum but reports by C. F. Hoyt, formerly with the federal department of agriculture, now with the state department as dairy specialist, prove our claims are not merely local. It costs more money to produce clean, pure, wholesome, rich milk than most of the present agitators can conceive.

High price of land: Few dairymtn have the high overhead of interest—or rentals—which is paid by California dairymen. We have advertised our wonderful blessings and people have come from all parts of the world until dairies have given away to mansions, or possibly the great tire or other manufacturies, until they have been crowded farther and farther from the center and rentals and interest payments have gardually increased.

Hay: It may be noted that in the last issue of the Cultivator No. 1 dairy alfalfa was quoted $5 lower in San Francisco than in Los Angeles. A difference of $5 per ton adds materially to production costs.

"Labor is lower": It is probable this is true, but not to the extent of two cents per quart cut already made and many a dairyman is compelled to pay the same price for his labor today that he paid a year ago.

Transportation: Much of the milk and dairy supplies is brought into the larger cities in trucks, yet sufficient must be shipped in over the railway to maintain needed quantity. It is but fair on the part of the agitator to consider that the dairyman who ships by railway is today paying 25 per cent more than he did 12 months ago.

But the trouble is that the present agitation is not intended as a campaign for cold blooded discussion of the situation of the dairymen and of an increased supply of purer, better, or possibly cheaper milk, but is more in the nature of a hysterical campaign in which strictest justice to both producer and consumer may not be secured.

An Open Letter to Every Fruit Grower and to the Members of the Organized Branches of the Industry in Particular

NOT OVER-PRODUCTION, BUT UNDER-CONSUMPTION, IS WHAT AILS YOUR BUSINESS TODAY.

In the past the fruit industry has experienced in cycles, seasons of depression—never from over-production, but always from under-consumption, without any constructive effort having been put forth, except upon the part of one or two individual organizations, to remedy the condition.

EACH OF THESE PERIODS OF DEPRESSION HAS CAUSED YOU LOSSES MANY TIMES MORE THAN THE COST OF THE PLAN I AM PROPOSING.

If you are a grower of fruit and nuts and are not affiliated with some one of the organized branches of your industry, YOU SHOULD CONNECT UP AT ONCE.

In my former letter I announced to you my plan of placing in the hands of every one of the fifteen million American housewives "THE STORY OF CALIFORNIA FRUIT FOODS," a book so gotten up as to be a gift prized by every recipient, so cleverly edited as to be intensely interesting, with recipes so compiled by the world's best culinary talent—simple, wholesome, economical, labor-saving—as to be an indispensable necessity to her.

The American housewife is the key to the consumption of your fruit products. She has a romantic interest in California and your products. She is confronted each day with the problem of providing a wholesome, attractive and economical diet for her household. The great majority of housewives but rarely use your products. She is ready and waiting at your door, if you will but place "THE STORY OF CALIFORNIA FRUIT FOODS" within her hands, advising her of their wholesomeness, their attractiveness and their economy in labor and cost.

It will of necessity devolve upon the organized branches of the industry to take the initiative in creating an organization that will put this over.

To put this plan over will require on your part an expenditure of not more than one cent out of every dollar of proceeds from your crop, over a period of three, and, at most, four years.

The loss to you from the present period of depression in the industry will cost you many times more.

THE ONE ABSOLUTELY INSURES YOUR FUTURE. THE OTHER IS GONE.

I am informed by an advertising expert that the average advertising expenditures of various well known commercial enterprises will average 2½ to 4 per cent of the amount of sales, and in the automobile industry from 1 to 1½ per cent, yet the average for the industry will fall short of 1 per cent. The additional expenditure required to put over the "Bergtholdt Plan," together with the continuation of the advertising expenditures now being made by the various branches of the industry, will make a total expenditure for advertising your products of not over 2½ per cent, which is still under the average minimum expenditure employed by every other successful commercial enterprise. The plan I am suggesting will connect your industry up directly with the one individual who absolutely controls the consumption of your product—THE AMERICAN HOUSEWIFE, AND THE RETAILER WHO DISTRIBUTES YOUR PRODUCT.

One dollar out of every hundred invested by you for a period of four years in putting this plan into effect is by no means an expenditure, but is an absolutely necessary investment in your present situation, and you will be repaid in increased proceeds from each year's crop several times the total cost. The value of your orchard property, and of every acre of land in California susceptible of fruit culture, will be automatically enhanced.

Contributions from growers not allied with any of the marketing organizations can be secured in the same proportion that you will pay, by a drive for their support.

This plan will add to the prosperity and wealth of California from Yreka to San Diego, and the aid of every allied industry and of every commercial body of the State also can be secured.

The co-operation of every jobber and every retailer can be secured, not alone to contribute in some portion towards its cost, but to place a copy of "THE STORY OF CALIFORNIA FRUIT FOODS" in the hands of every housewife, under the direction of your organization.

The organization that will put this over will comprise the best brains and executive ability at the command of the industry.

This organization also, while putting this over and directing the distribution of this book through your jobbing and retail channels, will be admirably equipped and SHOULD FUNCTION IN A MOST VITAL AND HERETOFORE OVERLOOKED PHASE OF THE DISTRIBUTION OF YOUR FRUIT PRODUCTS.

A department of this organization should be created for the purpose of making an expert analysis of the methods of the distribution of your products from your orchard to the ultimate consumer, and under a corps of experts, should function in the capacity of systematically instructing every retailer of your products in the United States how to specialize in the sale of California fruit foods; and should instruct him in methods of intensive modern retail salesmanship; and should devise means and methods that will make every retailer and every retailer's clerk an intelligent salesman of your products, and thus automatically, by increased efficiency eliminate profiteering and other abuses now prevalent.

Systematic efforts should be made to induce every retailer to specialize in the sale of California fruit foods and set aside a department for that purpose.

By means of the efforts of this department of aid to the retailer and jobber, the efficient and intelligent co-operation of these factors will be secured.

"THE STORY OF CALIFORNIA FRUIT FOODS" in the hands of every housewife—every retailer made an efficient salesman of your product—THIS IS THE BERGTHOLDT PLAN."

Commendable efforts are now being put forth by most of your organizations in the direct advertising of your products, but, as your sole reliance for informing the American housewife of the merits of your products and securing her co-operation in their use, I am convinced that you will agree that they fall short and do not reach the majority.

A recent survey of the various publications being used by several of your strongest marketing organizations shows that their advertising efforts are being expended mainly in ten publications, comprising the best of their kind, with a total circulation of 12,673,000.

Among these ten publications used, a number are duplicated to the same subscribers (my own household subscribes to five of them) and it is safe to assume that one out of five of these 12,673,000 subscriptions is duplicated one or more times. This would justify a reduction of twenty per cent to arrive at the total number of individual subscribers. A large proportion of two of these publications, having a subscription of over three million, that is, the Saturday Evening Post and Literary Digest, circulate among other than housewives. Allowing for this deduction and the duplications, it is safe to assume that these ten publications cannot circulate among more than ten million individual housewife subscribers, and most likely less.

The back cover page in these publications is the most effectiev advertising positions. It is conceded by experts that, out of every one hundred subscribers, a full page advertisement on the back cover page will be read by a minimum of twenty to a maximum of eighty readers, according to the interest, color and attractiveness of the ad. Therefore, not more than eight million out of the ten million subscribers referred to can be expected to ever read a full page ad on the back cover page.

The next choicest location in these publications is the first page following the full page editorial matter of the publication. This is the best inside page, and by advertising experts is rated at seventy-five per cent as efficient as the back cover page. For a full page advertisement on this page, one hundred per cent efficient as to display and subject matter, the highest anticipation of readers would be sixty out of one hundred, or six million readers out of the subscription list of the publications referred to.

Now it is not possible that the various fruit organizations employing these publications should each one always occupy this choicest inside full page. Nor is it possible that, for display and subject matter, the advertisement should always be one hunded per cent efficient; yet, to be conservative, we will allow that the advertisement of each one of your various organizations using these publications is read by six million housewives of the ten million assumed housewife subscribers to these publications.

As there are fifteen million housewives in the United States daily burdened with the problem of providing for their households a dietary wholesome, attractive and economical, each of them equally interested in California and in your produce, you will realize that but forty per cent are being reached by these publications, AND THESE ONLY IN FRAGMENTS.

Now I say by all means keep up your publication advertising, but make it more effective. Place in the hands of every one of the fifteen million American housewives "THE STORY OF CALIFORNIA FRUIT FOODS," edited and compiled absolutely one hundred per cent efficient, and you not only reach and secure the co-operation towards the consumption of your products of those whom you do not now reach, but you make of every one of the six million readers of your advertisements in the publications referred to an interested and intelligent reader of what in your advertisements you have to say.

"THE STORY OF CALIFORNIA FRUIT FOODS" placed in the hands of every housewife, will make your publication advertising many times more efficient, while your advertising can be made to increase the efficiency to every housewife of "THE STORY OF CALIFORNIA FRUIT FOODS." Each will prove indispensable to the other.

"THE STORY OF CALIFORNIA FRUIT FOODS" must be complete. This project must be put over collectively, every branch of the industry participating.

No other branch of the industry of itself will prosper for long alone. The permanence and the success of every individual branch of the fruit industry are dependent altogether upon the prosperity of the whole industry.

The extensive consumption of just oranges and almonds or of just prunes and peaches alone will not consume the tonnage of these crops that will be consumed of them under an extensive consumption of every fruit product.

While I grant that it is possible for some one of your organizations alone, by efficient distribution and efficient advertising, to successfully distribute their individual product, to a degree that you do not feel the need of co-opeating collectively to put this over for the benefit of the fruit industry and your product as well. Such an organization may, for the time being, prove efficient in its individual capacity, but it can hardly be rated as one hundred per cent Californian.

NATURE'S LAW

"Now this is the Law of the Jungle as
old and as true as the sky;
And the wolf that shall keep it may
prosper
But the wolf that shall break it must
die;
As the Creeper that circles the tree-
trunk, so the Law runneth forward
and back;
For the strength of the Pack is the Wolf,
and the strength of the Wolf is the
Pack." —Kipling.

This plan is being enthusiastically endorsed by growers everywhere, and by prominent factors in the industry.

Had this plan been in operation, many millions would have been saved the California fruit grower during the present period of depression.

Every dollar you put into this plan is not an expenditure but is an investment absolutely imperative and that will be repaid you ten-fold from the proceeds of each year's crop, and one hundred-fold from the assured prosperity of your industry in the future, aside from the enhanced valuation of your orchard acreage.

In the present situation it is imperative that an organization be created and the task begun.

IT WILL BE UP TO THE ORGANIZED BRANCHES OF THE INDUSTRY TO ASSUME THE INITIATIVE IN CREATING THE ORGANIZATION THAT WILL PUT THIS OVER.

It is absolutely up to you and me, as individual fruit growers, to set aside every other consideration and at once directly bring your voice and your influence to bear upon the management of the marketing organization with which you are connected to take action with other organizations to CREATE AN ORGANIZATION THAT WILL PUT THIS OVER.

Your marketing organizations are democratic bodies and your Boards of Directors will follow out your desires.

It is vital to your success as a fruit grower and to mine, that you do your part to this end, and that you persevere—don't let go—keep your shoulder to the wheel. I am doing mine. Your success and mine depend upon this project being put under way at once.

J. E. Bergtholdt

Silva-Bergtholdt Co.
Newcastle, Cal.

In The Orchard

In the orchard, where insect pests infest the tops of the trees, a powerful sprayer is always necessary.

The American Beauty Dust Sprayer was designed to meet this very need. Its powerful blast forces dry insecticides to all parts of the tree, penetrating the center of every leaf and blossom cluster, thereby giving greatest protection.

In the control of Aphis, Thrips, Mildew, Red Spider and other pests *"Calispray"* dusts and the American Beauty Dust Sprayer are unequalled for economy and efficiency. The machine is operated by one man and places the dust only where needed and in its most efficient form. In orchard work 15 acres a day may be covered, with larger acreages in field or vineyard.

For best results use *"Calispray"* dusts made in our own factory — a brand, ready prepared, for every insect pest.

SUGGESTIONS FOR THE CONTROL OF RED SPIDER IN DECIDUOUS ORCHARDS

(Continued from Page 705.)

begins. In the Sacramento Valley this is the last of June or the first part of July. This date may be varied by local conditions or in different parts of the state, however the treatment should never be delayed until the attack becomes serious. Sulphur may be applied either as a liquid spray or as a dust. The latter method requires less time but should be repeated one or more times, while one thorough application of a liquid spray at the very beginning of an attack will frequently control the spider for the season.

Sulphur as a liquid spray may be prepared by mixing the dry sulphur with glue water or flour paste or the commercial forms of "sulphur pastes" or "wettable sulphurs" may be secured. The manner in which the mixture is prepared seems to be less important than the amount of sulphur which is used. Experimental results indicate that about five pounds of sulphur would be used per hundred gallons of spray mixture. The formula for the sulphur-glue water mixture is: Formula I. Sulphur (flowers or sublimed) 5 pounds, dry glue (dissolved in 1½ gallons of hot water) ¾ ounce, water 100 gallons. Mix sulphur and glue water into a thick paste and rub through a sieve into the spray tank with the agitator running. Flour paste may be substiuted for the glue water, using two pounds of the dry paste or three pounds of the wet paste such as is used by bill posters. Water is added to the paste and the five pounds of sulphur stirred in according to the directions given above. Apply these materials very carefully and on prunes give special attention to wetting the under surface of the leaf. On large trees, 20 to 28 feet tall, eight to ten gallons or more of spray will be necessary to thoroughly cover every leaf, particularly if applied with a gun. Careless or scanty spraying will only check the attack and on account of the rapid increase and dispersal of the mite a reinfestation soon occurs.

For heavy infestations of red spider use the following combination of lime-sulphur solution and sulphur: Formula II. Lime-sulphur (31 to 34 degrees Baume) on (almonds, 2 gallons; prunes and peaches, 1 gallon); flour paste (wet 3 pounds, dry 2 pounds); sulphur 5 pounds; water to make 100 gallons.

The combination spray acts much quicker than where sulphur alone is used and is of value chiefly when the attack has become severe and it becomes necessary to check the spider as quickly as possible. Flour paste will act as a spreader for the lime-sulphur solution and hence is preferable to the glue water formula. Dry lime-sulphur five pounds to 100 gallons may be substiuted for the liquid lime-sulphur solution if desired. Barium-sulphur is a new compound which will probably be found as efficient as the above materials.

Lime-sulphur solutions are more or less caustic and hence should be used at a temperature below 100 degrees Fahrenheit if possible. However, a slight injury to the foliage is preferable to an unchecked attack of red spider.

Dusting with dry sulphur has been advocated commonly, but in the last two years has frequently been less successful than formerly. It has the advantage of speed, it being possible to cover 20 or 30 acres a day with a power blower, but since two or more treatment are usually necessary, dusting may finally require as much time as liquid spraying. The prevailing winds of summer make it very difficult to apply sulphur as a dust thoroughly, and also have a tendency to shatter the material off from the leaves.

Dusting sulphur will flow more freely in applying it and be just as effective if a ten per cent filler of hydrated lime or powdered kaolin is added. Larger amounts than ten per cent of filler retard somewhat the action of the sulphur, while a 50-50 solution is decidedly inferior. The control of citrus red spider is similar to that of the common red spider. It sometimes, however, attacks earlier in the season and for this reason spraying might have to be done in May or June.

The most effective control for the brown mite is winter spraying with crude oil emulsion, 12 per cent lime-sulphur solution, 1 in 10, or dry lime-sulphur solutions at recommended strengths. The latter solutions were most effective when applied just prior to blooming, while the oil spray is probably safer if applied at least three or four weeks before blooming, and when the trees have not been subjected to drouth or drying winds. The oil emulsion has a higher killing efficiency than the lime-sulphur solution but since the latter are of value as a fungicide and in controlling the twig borer (Anarsia lineatella) they will probably be most desirable in almond orchards. The distillate oils, which have been tested, when prepared as emulsions or miscible oils, have in all cases proven inferior to crude oil.

Spring and summer control of the brown mite is similar to that of the common red spider. Lime-sulphur solution prepared according to Formula II is more satisfactory for spring use than sulphur used alone. Dusting with sulphur proved of little value until summer temperatures were reached.

AVOCADO REGISTRATION COMMITTEE REPORTS

(Continued from Page 705.)

We have examined interesting trees and fruit on the properties of Willard Smith, Villa Park; Mrs. Ida Shaffer, Pasadena; Dr. Miles, Alhambra; Mrs. Titus Phillips, Alhambra; C. F. Wagner, Hollywood, and others.

Some good fruit measure up so well otherwise to the desirable qualities required in a good avocado that we regret it when we find them disqualified for general use by the presence of a seed much too big and out of all proportion to the size of the fruit. Such fine fruit are the California grown by Milo Baker at Hollywood and the Cady by C. F. Cady, Los Angeles.

Two of the original West India Garden introductions have come into bearing with fine fruit maturing in the spring. The Montezuma, a green fruit with a thick granular skin, dull yellow flesh, free from fiber, or with only a very slight discoloration and the flavor of the best, good and rich, weight of one sample 18 ounces, seed 3 ounces, and the other fruit the Schmidt, with a green color, thick skin, deep, clear yellow flesh, free from fiber and the flavor smooth and rich; weight of one sample 20 ounces, seed 2 ounces.

At our fall meeting many fine fruit of his No. 1 Seedling were exhibited, cut and tested from his tree at Whittier by Charles H. Hamburg. It is a variety which he has now decided to call the "Quaker." The strong growing tree, ten years of age and 30 feet in height, with spread of 25 feet, comes from a seed sent him from Guatemala. It had a few fruits the previous year and 50 in 1920. Buds taken from it and put into other stock have taken well and made strong, healthy growth. The fruit is large, green in color, up to a pound and a half in weight, with seed of medium to small size, thick skin, clear cream colored flesh and excellent flavor and quality, a slight bitterness showing in one test.

The Anaheim, from a tree grown by E. C. Dutton at West Anaheim, on property now owned by Otto G. Keup, was exhibited at the last annual meeting, and five fruit were afterward tested by the committee. They ranged in weight from 24 to 18 ounces and the seed from 3¾ to 2¼ ounces. The fruit was light green in color, with a thick skin and attractive appearance, clear yellow flesh with a very small amount of fiber discoloration and good rich flavor in three specimens. The other two were not so good and were thought to be immature.

The Hoff, grown by J. E. Hoff at Hollywood, is a large strong tree from a seed planted in 1911. It had a few fruit in 1916 and 1917, in 1918 it had 35 fruit, in 1919 50, in 1920 100. The fruit is pear shape, green in color, with a thick skin, weight 12 to 20 ounces, with a small seed. It matures in the fall but remains on the tree without dropping. The fruit tested was picked January 14, samuled January 20, and found in excellent condition. It weighed 16 ounces, seed 2½ ounces. The color of the flesh was a clear, bright yellow, no fiber and the

flavor and quality extremely good. The following is an analysis of this fruit made by Mr. Chace in December: No. 142, analyzed November 15, 1920; specific gravity of fruit, 1.0013; seeds, 17.46 per cent; pulp, 76.17 per cent; skin, 6.28 per cent; water, 71.13 per cent; ash, 1.51 per cent; protein, 2.23 per cent; fat, 18.47 per cent.

The Billingsly. A large tree on the property of Ray Billingsly, Villa Park, Orange County. A spring fruit weighing 10 to 16 ounces. Weight of three fruit sampled 10½, 13 and 16 ounces. Weight of seed 1⅝, 1¾ and 1¾. Fruit pear shape to oval. Color light yellowish green, turning partially brown. Flesh clear, bright yellow with merely a trace of fiber, quality excellent, with a good, rich and agreeably distinctive flavor.

The Butternut, from a budded tree on the Ferguson place, North Whittier Heights, tested March 6, 1921; weight 12 ounces, seed 2 ounces. Shape round oval, skin thick, granular inside, leathery outside; color dark red, smooth and glossy, with a finely webbed appearance. Attractive looking. Flavor and texture good.

The Monroe, on the place of B. H. Sharpless at Santa Ana, is a green pear shaped fruit of fine appearance and good flavor and quality, weighing 14 to 18 ounces, a moderate sized seed and clear yellow flesh. Tree a good bearer.

The Knight variety has come into bearing with another fine fruit added to the credit of the introducer of the Queen and Linda. It is a very promising round green fruit. The fruit as well as the tree has excellent appearance and as to quality it is still under observation.

The Queen and Linda have been so widely planted that we now are in the way of receiving the experience with them from a large number of growers.

The Sherman Seedling No. 1, grown by E. Goodell Sherman, Hollywood, comes from a seed brought from Honduras and planted in 1910, according to an old diary of Mr. Habersham. Eight fruit, maturing this spring, form its first crop. They are very large and handsome, weighing from 20 to 30 ounces, with seed from 3½ to 4½ ounces, of an elongated pyriform shape and smooth yellowish green leathery skin. The seed in some of the fruit is slightly loose in the cavity, and the flesh is yellow with a very little fiber discoloration, not enough to be objectionable, remarkably smooth in quality and the flavor very fine and agreeably rich. The character of the wood growth in young trees is now on trial in several orchards.

The Lyon. The description of the Lyon given in the last annual report of the committee applies equally today. The report is absolutely correct, fair and impartial, and can easily explain how the extreme difference of view arises as to the value of the Lyon. It has none to those who have lost quantities of weak young trees and find shriveled fruit under those that remain. On the other hand, the remarkably large crops it produces, per tree and per acre, cause others to believe these troubles can be conquered and the variety become the poor man's friend, as a Monrovia grower calls it. Mr. Rideout has found that a sport or a bud variation has produced for him a selected tree, different from the others, maturing its fruit earlier and in tests to date giving healthy young trees. A fruit picked from this tree in January, 1920, was sampled by some of the committee the first week in February and the flavor found to be good.

The Dickey A is on the market, attractive in appearance and confirming its previous reputation of the possession of a fine rich flavor and a very small seed.

Three varieties claim consideration as winter maturing avocados; Dutton, Tiger and Dorothea.

The Dutton, grown by E. C. Dutton at West Anaheim on the place now owned by Otto Keup. Tree vigorous and productive, with crop off the tree before the following season's blossom. Crop matured from January onward last year, February onward this year. Fruit large, a pound or over, shape pyriform, color purple, skin thick and granular, seed medium to large. Two fruit sampled in March, 1920, weighed 15 ounces each, seed 3 ounces and 2¾ ounces, and doubtless were overripe as the flesh was dull yellow with discolorations around the seed, some fiber and flavor only fair. No samples were available this year, the fruit not being obtainable at proper maturity. Two other tests made in March, 1920, from fruit picked in February bring different and very favorable reports. Mr. Kinman writes he found the fruit submitted to him exceedingly palatable and first-class in every way, seed a little large but not excessively so, and a little bit of fiber at the blossom end. Dr. Coit writes he took the samples to Prof. Jaffa for analysis and testing and they found the fruit of "good size, texture and quality and it in every way gave us a very favorable impression. I was particularly pleased with the flavor. I think you are warranted in feeling proud of the fruit." The analysis showed 16.2 per cent of fat.

The Tiger, grown by Clair Bishop at Highland. Tree an upright grower and heavy bearer of fruit, weighing from 10 to 16 ounces and maturing from January onward. A sample fruit picked February 20 weighed 10½ ounces, seed 2 ounces. We find the seed ranges from 2 to 4 ounces. A fine looking pear shaped fruit, with a rough thick skin, purple in color. Flesh clear light yellow, of an average avocado flavor. Some fruit showed considerable brown fiber. This tree was produced from a seed received in 1914 from J. B. Walker of Hollywood and had a crop of 200 fruit the present season. It originated farther inland than any other variety of which we know and stands the hot dry air of the interior valleys admirably. Much better than other Guatemalan varieties growing near it.

The Dorothea, grown by A. W. Miller, Hollywood, from a seed of the well known Miller tree and believed to be a cross from one of the Mexican race. The tree is vigorous and productive. Crop 1918, 16 fruit; 1919, 30; 1920, 250. It blooms January and February, ripens mainly in December and January. Three samples, picked and tested in January, weighed 12 ounces, 8¼ ounces and 8 ounces; the seed respectively 1 ounce, 1 ounce and 1¼ ounces. Color light green with many yellow spots, skin leathery, flesh clear attractive yellow of good texture, no fiber and excellent flavor.

The committee report is based not alone on our own judgment but on the experience of the different avocado growers covering all parts of Southern California.

Letters for the committee or samples by parcel post for testing should be sent to the chairman at Upland.—Chas. D. Adams, chairman, T. U. Barber, Wm. Hertrich, C. F. Kinman, L. B. Scott.

OLIVE ASSOCIATION MEETS

The annual meeting of the California Olive Association, representing 800 growers and the majority of packers in the state, was held Monday, April 18, 1921, in San Francisco. All of last year's officers were reelected and the board of directors upon their reelection gave the advisory board power to act. After considerable discussion the assessment for the coming season was fixed at $7.50 a ton for all olives handled by packer members.

Financiers representing bonding houses of California have made a complete survey of business and financial conditions in the Salt River Valley of Arizona and report them to be excellent in spite of the general depression and the unsatisfactory markets for cotton.

ESSEX MOTOR CARS

E S S E X

ESSEX MOTOR CARS

Read What "Hard Drivers" Write of Essex Reliability

They say that under severest service the Essex stays solid, tight, and free of noises, with little or no repair outlay.

And note their economy experience. Some have owned six, eight, or more cars previously.

Their next car will also be an Essex. They say that.

The Essex does not grow old, because it is rigidly built. Adjustments are provided to take up wear. Thus it is always firm, quiet, smooth and easy riding.

Your dealer will gladly explain wherein Essex duplicates costly car construction.

"I cannot imagine more abusive service—than have given my Essex in 15,000 miles of prospecting work, in virgin, rocky country. Running as well today as when I got it. Two other cars in the same kind of service are 'shot'."

G. G. SAWTELLE, Pawhuska, Okla.

"Have driven my Essex 16,400 miles. Had driven eight different makes of light cars, and none would last me a season. I drive a car hard—bad roads, all weather. Upkeep has been practically nothing. Its remarkable performance and the satisfaction it has given has led to many more Essex sales as I believe I have been instrumental in selling more Essex cars than any of your salesmen. I have never been bothered with squeaks or rattles."

A. I. BRUETT, A. I. Bruett Piano Co., Milwaukee

"Drove Essex 20,354 miles in 7 months. Gas consumption averaged 19 miles to the gallon. Twenty-four gallons of oil were used. No repairs whatever were made during this period, and the engine was not cleaned until approximately 12,000 miles had been covered.

"I have driven cars for the last 6 or 7 years. Cars, with me, have to do exceptionally heavy service, and this year will be the first I have ever used the same car for the second season, as I am doing with my Essex.

"My work as a travelling salesman, necessitates covering four Canadian provinces. Part of my way lies through the Metepedia Valley; the roads are so narrow that it is necessary before starting to remove the windshield and top and to bandage the body and mud-guards with heavy cotton in order to keep the finish from being destroyed by the branches and bushes at the sides of the roads.

"Naturally it would be hard to sell me anything but an Essex in the future—not only for endurance, but for getaway, 'pep' and all around performance."

THE AUTO-OILED AERMOTOR
A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

A year's supply of oil is sent with every Aermotor

Some of the Accomplishments of the Legislative Committee

By R. N. Wilson

THE biennial legislative battle is over; the final rush and crush is passed; the smoke screen is lifting and results are beginning to show in their true light.

To the observant farmer the accomplishments along agricultural lines must be highly gratifying; for unquestionably greater progress has been made during the past year than ever before. The advancement is notable in that it has been far broader than

R. N. Wilson

the mere passage of bills. From the viewpoint of one who has been in close touch with legislative proceedings, some of the outstanding developments would seem to include the following:

The careful correlation and focusing of the legislative activities of 60,000 farmers.

The creation of greater harmony and a closer working relationship between various farm organizations.

Through a series of meetings the farmers came into more intimate touch with their college of agriculture and state department of agriculture, and, as a result, were able to obtain far more adequate support for these institutions.

A considerable number of well digested, constructive bills, which do not smack of class legislation, were passed.

The passage of several vicious bills was blocked.

The farmers, for the first time, maintained a permanent representative at the capitol.

Prompt and thorough information as to legislative progress during the session was provided as never before.

A confidence was established among the legislators which should aid materially in advancing future legislation.

The results obtained are not purely a matter of luck, not because public sentiment has recently leaned toward the farmer, although the value of the latter item should not be underestimated.

Some 18 months ago the commodity organizations, realizing that the legislative portion of their business should be permanent, organized the agricultural legislative committee, employing one man to devote his entire attention to legislation. Largely to the careful and persistent work of this organization, with the fine cooperation of other farm organizations, must the successful accomplishments be credited.

A new development in the legislative field was sprung by the farmers last fall when they made a careful investigation of the activities of the college of agriculture and the state department of agriculture. This work was done by six different groups of farmers representing 27 different farm organizations with a membership of approximately 100,000 members. Through this investigation the farmers not only gained a far more intimate knowledge of the activities of these great institutions, but they arrived at a thoroughgoing knowledge of their needs from the farmers' standpoint. These data were effectively used as a basis of information for the legislators time and again during the session. It will be remembered that following the farmers' investigation their conclusions were presented to the university regents, the budget board and the governor in a most forceful manner and there are many evidences that this presentation has not yet been forgotten.

Measures Blocked

Not the least part of the zest of life is furnished by clashes with those who do not think as we do, and a few serious clashes with those who proposed bills diametrically opposed to the farmers' interests were inevitable.

It is true that some of the most vicious bills, including the imitation milk bill and three bills stipulating unreasonable resuirements as to labeling and storage of food, were never brought out of committee, partly due to the fact that the farmers were on guard. Agriculture represents both capital and labor but was aligned with neither of them, nor was it burdened with their antagonisms. The sharpest skirmish came with capital over the oleomargarine bill, which was backed by a powerful subsidiary of the Standard Oil Company. After two heated arguments in committee, the bill was finally passed on to the floor of the senate with the assistance of the votes of some of the senators representing rural communities. It is now a well known fact that the oleo bill finally passed the senate under a compromise agreement that it would go no further and the rural members voting favorably on the bill in committee ultimately voted against it on the floor.

A clash with labor came over a bill introduced by the Egg Candlers Union, which would have required that all eggs sold at retail must be candled. Even the back yard enthusiast, who sells to his neighbors, would have been compelled to candle his eggs before each sale was consummated. A very clever demonstration of candling eggs and the possible findings in the way of rotten eggs, fertile eggs, etc., was made before the committee of agriculture in the assembly and made a very favorable impression. The poultry interests maintained that the measure was entirely impractical and the facts were so strongly on their side that when the bill was voted upon on the floor of the assembly many of the regular adherents of labor failed to support it.

The Long Bill, which would have forced farmers to market their products regardless of price, slipped unexpectedly out of the judiciary committee, to which committee it should never have been referred. This measure was an exact duplicate of the law placed on the statutes in Montana in 1919, and similar to laws in a few other states, but apparently the author did not realize its full portent. When this was shown him, he first asked that the bill be amended and later agreed that its passage would not be urged.

Important Cooperative Bills

Among the bills of most fundamental importance to agriculture, which, by the way, were the first agricultural bills signed by the governor, are senate bills Nos. 590 and 591, clarifying many of the points concerning our present cooperative laws which had been open to question following opinions expressed by the attorney general. One of these opinions was to the effect that cooperative organizations had no authority to make a profit for their members. That such funda-

mental questions should be definitely settled was vitally important, and the attorney general concurred in this belief. Geo. E. Farrand, who, together with Senator Harris, drew the bills which were afterwards submitted to the cooperative marketing organizations, has commented upon the measures as follows:

"The bills are intended to make more clear existing statutes concerning cooperative, non-profit corporations and associations. They do no more than recognize as lawful the acts which many, in fact most, cooperative corporations and associations in California are now doing. The changes in the laws made by these bills in substance are to make it more clear that such cooperative corporations or associations may, as incident to their marketing, handle such business as is necessary in manufacturing by-products or preparing the products of their growers for market, and to make it definite that such corporations and associations may have assets, though they are precluded from issuing shares of capital stock, and to acquire and own real and personal property, including shares of stock in other corporations. These changes remove any doubt as to the authority of these corporations and associations to conduct their business activities for their members for the profit of the members, or to use or employ any of their facilities in rendering incidental services to others, all, however, to be for the purpose of enabling such associations to be totally cooperative and to act at cost for their members.

"Certain other technical changes are made in the statute with reference to the manner of voting, and the like, but these do not affect the substance of either of the present titles under amendment.

"Insofar as the borrowing of money is concerned, the issuance of bonds and securities, the bills bring these associations and corporations under the jurisdiction of the commissioner of corporations, so that no likelihood of danger to the public interest is involved in recognizing the clear right which these associations and corporations have always thought they had to borrow money, and to evidence such money borrowed by appropriate note, mortgage, deed of trust, or other security."

Pure Seed Bill

Another measure of general interest is the pure seed bill, which passed after many years of vicissitudes. Almost the identical bill was passed last year, carrying an appropriation of $14,000, but unfortunately this was divided into two appropriations, invalidating the bill. At this session Senator Rigdon placed the body of the law in one bill and an appropriation of $15,000 in another, both of which were passed by the legislature and are now awaiting the governor's signature as this is written. California has become the dumping ground for poor seeds from other states where more stringent laws have been in effect, which situation should be entirely remedied by the pure seed law. In its present form the measure is satisfactory to farmers and seedsmen alike and promises large financial savings to all concerned.

THE PRESIDENT OPENS VALENCIA SHOW

(Continued from Page 703.)

packing houses under a commercial brand—First, silver cup, won by the American Fruit Growers, Inc., Lindsay; second, certificate, won by the American Fruit Growers, Inc., of Fullerton.

Class No. 7, for the best 12 boxes of lemons—First, $25 cash, won by the American Fruit Growers, Inc., of Orange.

Class No. 8, for the best eight boxes of Valencias—First, cup, won by the Anaheim Orange and Lemon Association of Anaheim; second, certificate, won by the American Fruit Growers, Inc., of Yorba; third, certificate, won by the American Fruit Growers, Inc., of Placentia.

Class No. 9, for the best four boxes of Valencias—First, gilt banner, won by the Anaheim Orange and Lemon Association of Anaheim; second, certificate, won by the American Fruit Growers, Inc., of Lindsay; third, certificate, won by J. R. Ragan of Orange.

Class No. 10, for the best four boxes of lemons—First, gilt banner, won by the American Fruit Growers, Inc., of Orange.

Class No. 12, for the best commercial pack on one-box lot of Valencia oranges (full boxes with cover on)—First, cup and $10 cash, won by J. R. Ragan of Orange; second, certificate and $5 cash, won by the Santiago Orange Growers Association of Orange; third, certificate, won by the Stewart Fruit Company of Anaheim.

Class No. 13, for the best commercial pack of one box lot of lemons (full box with cover on)—First, cup and $10 cash, won by the Anaheim Orange and Lemon Association; second, certificate and $5 cash, won by the American Fruit Growers, Inc., of Lindsay; third, certificate, won by the American Fruit Growers, Inc., of Fullerton.

Class No. 14, for the best feature display without mechanical action, entered by chambers of commerce or citrus fruit associations—First, cup and $75 cash, won by the Anaheim Orange and Lemon Association of Anaheim; second, certificate and $50 cash, won by the Anaheim Citrus Fruit Association of Anaheim.

Class No. 16, for the best feature display entered by individuals, firms or corporations—First, cup, certificate and $75 cash, won by the American Fruit Growers, Inc., of Los Angeles; second, certificate and $25 cash, won by the Stewart Fruit Company of Anaheim; third, certificate and $15 cash, won by C. C. Chapman of Fullerton.

Class No. 16-A, a special prize for the best feature display having mechanical action, entered by individuals, firms or corporations—Prize cup and $50 cash, won by the Pacific Electric Company of Los Angeles.

Class No. 17, plate of table displays, best plate of Valencias (five specimens)—First, certificate, won by the Anaheim Orange and Lemon Association of Anaheim; second, certificate, won by Fred Koch of Etiwanda; third, certificate, won by J. E. Cunningham of Anaheim.

Class No. 20, best plate of Valencias (12 specimens)—First, prize ribbon, won by the Anaheim Orange and Lemon Association of Anaheim; second, the Santiago Orange Growers Association of Orange; third, Fred Koch of Etiwanda.

Class No. 21, best cluster of oranges—First, certificate, won by A. E. Walkup of Orange; second, certificate, won by Walter Leiffers of Olive; third, certificate, won by W. L. Tadlock of Anaheim.

Class No. 22, best cluster of grapefruit—First, certificate, won by C. C. Chapman of Fullerton; second, certificate, won by Mrs. M. D. Livingston of Anaheim.

Class No. 23, citrus fruit by-products (commercial)—First, $15 cash, won by Hushmans family of San Gabriel; second, $10 cash, won by the Amberglass Products Company of Monrovia.

Class No. 24, for the best general displays of citrus fruit by-products made and entered by individual—First, $10 cash, won by Mrs. R. N. Allen of Anaheim; second, $5 cash, won by Mrs. M. D. Livingston of Anaheim.

Judges were H. E. Collins of Rivera, C. D. Hubbard of Carpinteria and J. A. McGregor of Fontana. A. S. Bradford of Placentia was chairman of the awards committee.

BROWN ROT ON DECIDUOUS

This disease is on the increase. From the experience of the past with the disease in citrus orchards and from a few observations of different orchard treatments on brown rot, the indications are that Bordeaux or lime-sulphur treatment will probably prove to be satisfactory control measures. This latter remains, however, to be confirmed by experiments. Observations show rather conclusively that this season's brown rot is decreasing in activity with the change to bright and warmer weather. However, it seems advisable to take measures that may prove adequate for control. Because of the lack of definite information some suggestions may not be amiss at this time.

Fall Spray Nursery Stock

The manner in which the infection seems to have taken place and the subsequent development of the disease would indicate that a fall spray of Bordeaux on all nursery stock would be a good form of insurance.

Soil Infection Possible

Evidence is at hand indicating that there is considerable soil infection in nursery yards. If this is correct and if weather conditions are favorable for development of the disease in these yards next year it may be very desirable to change the place for heeling in the trees where it can be done conveniently. If it is not practical to change yards it would probably be advisable to plow or spade up the land and spray the soil one or more times in the late summer or early fall with a good strong Bordeaux mixture.

SUTTER COUNTY PLANTINGS

A report received from Harry Stabler, county horticultural commissioner at Yuba City, indicates increased activity in 1921 new orchard acreages. A total of 2,457 acres was newly planted to fruit trees, which added to 682 acres of grapes planted out this year makes a grand total of 3,139 acres.

In spite of the fact that most of the mines of Arizona are closed or working only a few men, the assessments of mining property are based on a five year average production.

Walla Walla, Washington, recently shipped to Canada two carloads of rhubarb and 12 carloads of spinach.

Gill
One-piece Piston Rings
reduce oil consumption

because: they don't permit oil to enter the combustion chamber where it will be burned up without accomplishing *anything.* They keep oil down in the crank case and on the cylinder walls where it belongs. And at the same time Gill Piston Rings hold *all* of the gas in the firing chamber. None of it escapes past them. None of it condenses, and works down into the crank case where it thins the lubricating oil and makes it worse than useless. Gill Rings prevent that.

Identify the Gill One-piece Piston Ring by the joint, but do not measure its merit by the joint *alone.*

Gill Service is nation wide. There are more than 2,000 stocks of Gill Piston Rings in the country. Some one of these dealers is located near you to supply you with whatever size you may want and the number you want *when* you want them. If your garage or repairman or accessory dealer doesn't happen to carry Gill One-piece Piston Rings tell him to get them from his jobber or from the nearest of our 39 Branch Offices.

Was His Reasoning Sound?

IT WAS a pleasure to spend an evening with him. An organization of which he is a member had a representative in the city of Washington during last days of the Wilson administration and the beginning days of the Harding administration. He was exceedingly anxious to know how the new administration at Washington would meet the present and oncoming problems. A question of more serious moment to him, however, was how congress would meet the problems confronting it. He is no bolshevik—he is not even a socialist. He claims to be a patriotic, law-abiding American citizen. He lives it. He teaches it. He was—but wait, let him tell his own story.

"Why is the congress of the United States so slow, so conservative, so inefficient, so non-progressive, so devoid of initiative in meeting and solving great problems? It would seem that the representative law making body of the greatest republic on earth should be strong, virile, active, energetic, progressive, emphatic and irresistible in welcoming and meeting and solving great world problems; but if is exactly the opposite. Why? Here is the answer:

"Congress is dominated by lawyers. Look at the following table:

	Congresses	
	66th 1919-21	67th 1921-23
Lawyers	298	298
Bankers	29	26
Farmers	19	21
News publishers	20	20
Manufacturers	14	16
Teachers	12	13
Merchants	12	12
Insurance	11	11
Real estate	14	11
Physicians	2	4
Owners public utilities	7	5
Clerks	....	....
Ministers	1	1

"I am making no stricture against the profession of law. I am merely stating that congress should not be dominated by such a large majority of men who, of necessity, must have the 'lawyer type of mind.' Let me explain what I mean by the 'lawyer type of mind';

"Suppose one man lets his pigs or his chickens get on his neighbors' property and destroy his growing crops. The aggrieved party goes to a lawyer's office. What does the lawyer do? Turns to his books. Studies law and custom and usage and precedent as it has been from the time when the mind of man runneth not to the contrary. Always backward looking, always hemmed in by what has gone before, always bound by established and proven and accredited facts.

"The world needs the lawyer type of mind, but in connection with it, the world needs another type of mind, the flying machine type of mind, and the congress of the United States will never blaze a pathway through the forest of the ages toward the fixed star of permanent stability and helpfulness for all mankind without raising its eyes sometimes from the beaten path for its feet to the unbeaten path of the skies. What we want, in congress and out of congress, is men of vision, men of initiative, men who are not bound by the red tape of custom, men who are eager to undertake and accomplish the impossible."

GROWING SUGAR BEET SEED

One of the first requisites of a permanent and satisfactory beet sugar industry is an adequate supply of seed of good quality. It has been scarce and as a result the production of sugar beet seed in the United States has made rapid progress during the past few years. The present annual requirement in this country is approximately 16,000,000 pounds, of which about 50 per cent is now produced within the nation's borders. With the continued development of the sugar beet industry more and more seed is required each year, but it is confidently expected by specialists of the United States department of agriculture that eventually the total American requirement will be grown in this country.

Investment Required Large

The development of this industry, according to the bulletin, has been greatest in the irrigated sections of Colorado, Montana, Utah and Idaho, and special reference is given in the bulletin to the growing of sugar beet seed in this region. The industry is best adapted to large operations, the investment required for special machinery being so great that the business is not really profitable on less than 100 acres. It is to the growing of sugar beets on a large scale that the instructions in the bulletin refer.

The sugar beet plant is a biennial and the roots do not, under normal conditions, send up seed stalks and develop seed until the second year. Beets of small size are grown the first season, are stored in pits known as silos during the winter, transplanted in the spring, and the seed is harvested at the end of the second season.

Only small sized roots not over 16 ounces in weight are used for commercial seed production. The eight ounce beets are usually considered the most profitable. These are known among seed producers as stecklings.

Roots for commercial seed production are usually started about the same time as beets intended for factory purposes, though some growers have had better success by starting their stecklings a little later, as in June. July sowings may be satisfactory if conditions happen to be just right, but usually contain a large percentage of roots too small for profitable handling. To keep the roots from growing too large, seed is generally sown at the rate of 10 to 16 pounds per acre and the plants are left unthinned. It is important that the seed be of highest quality and, because an even stand is highly desirable, the bulletin recommends that germination tests be made. Roots standing in open, exposed places are apt to develop too large to make good stecklings. This crop should be cultivated and kept in a vigorous growing condition until harvest.

Beet roots naturally start quickly and early cultivations are very important. If the soil is not stirred after the first irrigation, the earth frequently shrinks away from all but the lower part of the roots, resulting in a drying up of the beets and a decided unevenness in the maturing of the crop.

In arid sections, all seed crops may safely be cut while the foliage is still green and before the seed balls have become dry enough to shatter. Harvesting must be done quickly to prevent shattering of seed. The stalks are cut close to the ground with hand sickles and immediately shocked in bundles about 30 inches wide at the top. In 10 to 20 days they are usually dry enough to thrash or stack.

The yields of sugar beet seed in the Rocky Mountain states average approximately 1,000 pounds to the acre, with a range of 300 to 3,000 pounds.

NEED FOR STANDARDIZING CONTAINERS

TO eliminate fraud in the marketing of fruits and vegetables by the substitution of short measure packages at full measure prices is one of the principal objects of specialists of the United States department of agriculture now making a study of the hundreds of different types of containers now in use. For example, baskets which contain seven-eighths of a bushel are frequently used as bushel baskets, it being difficult to detect the short measure. In Farmers Bulletin 1196 from the bureau of markets the specialists discuss the need for standard containers for fruits and vegetables and describe how the public is sometimes defrauded because of the many types and sizes of containers now in use.

Since the passage of the federal standard barrel law in 1915 there has been steady progress in the work of

A Time Saver on the Farm

INTERNATIONAL Motor Trucks are big time savers on the farm. One farmer living ten miles from town makes the round trip with an International in less than three hours. It used to take a whole day with horses.

There are fewer chores than when horses do the hauling. The sturdy, reliable International requires little attention. Unsurpassed International service prevents delays and assures low cost operation. This saving in time alone makes the International truck more than worth its cost on the farm.

The four-cylinder block-cast, valve-in-head engine has abundant power and sturdiness to meet all farm hauling demands. Every part measures up to the rigid standard of quality set by International engineers. Capacities range from 1,500 to 10,000 pounds. Body types include grain-tight boxes, stock racks, hay racks and other styles.

Let the nearest International Motor Truck dealer show you why International trucks increase farm profits.

INTERNATIONAL HARVESTER COMPANY
OF AMERICA (INCORPORATED)
CHICAGO U S A

92 Branch Houses and 15,000 Dealers in the United States

eliminating unnecessary and deceptive sizes from the list of containers used in marketing fruits and vegetables. The passage of the United States container act, establishing standards for grape baskets, berry boxes and small till baskets, followed in 1916.

Multitude of Sizes Increases Cost

The serious lack of uniformity of containers increases the cost of marketing because of the greater expense of manufacturing a large number of unnecessary styles and sizes and by breakage in transit, which is sometimes directly attributable to the difficulty of loading odd sized containers. There are in common use at present about 40 sizes of cabbage crates, 20 styles of celery crates, 30 lettuce crates or boxes, 50 styles and sizes of hampers, 15 styles and sizes of round stave baskets and marketing baskets varying in size from 1 to 24 quarts, whereas relatively few standard sizes would satisfy all demands of the trade. In many cases the 6 quart market basket, the 14 quart peach basket, the ⅞ bushel bean hamper and the 5 peck lettuce hamper are confused with peck, half bushel, bushel, and 1½ bushel baskets.

AMOUNT OF DYNAMITE NEEDED TO BREAK BOULDERS

Everyone admits that large rocks in fields that are cultivated are bad from every standpoint. Yet we see big boulders on farms wherever we go. "How much dynamite would it take to break up that rock?" (pointing out a stone in one of his fields), is a question often asked by a farmer of someone he thinks has had experience in blasting.

This is a question that can be answered with some degree of accuracy. Different kinds of rock are of varying degrees of hardness The shape of a boulder also has a bearing on the subject. For instance, a smooth, round stone is harder to break than a flat one.

There are three methods employed by practical blasters to break boulders: Mudcapping, which means laying the explosive on the stone and covering it compactly with stiff mud; snakeholing, meaning to tunnel or bore under the boulder, loading the charge in the dirt up against the under side of it; and blockholeing, which means drilling into the stone itself and loading the charges in the hole.

Mudcapping requires the least labor, but the most dynamite; blockholing, vice versa. Snakeholing is the 50-50 method as between labor and dynamite.

As a general rule, it may be stated that a boulder of average hardness, 1½ feet in diameter, may be broken with a pound of 50 per cent straight N. G. dynamite, if mudcapped; with ⅓ pound in a snakehole or with ⅛ pound in a blockhole. A 2 foot boulder could be snakeholed or blockholed as economically as the 1½ foot stone, but it would probably take ½ pound more dynamite to mudcap it. A 3 foot stone would take 2 pounds for a mudcap, ¾ pound for a snakehole or ¼ pound for a blockhole. A 4 foot rock is usually too big to break with a single mudcap shot, and will take about 2 pounds of dynamite for a snakehole blast or ⅜ of a pound for a blockhole. A 5 foot boulder would need about 3 pounds for a snakehole shot and ½ pound for blockholing.

It is best for a green hand at boulder blasting to make trial shots. For instance, try a stone with the charges suggested above. Watch the result. It may show it is necessary to increase the charge somewhat or may be that less dynamite can be used.

Tamping is the important feature of boulder blasting. If the tamping is compact, the minimum amount of dynamite will be necessary and the work is most certain to be successful in every way.

MAPPING LIGHTNING ZONES FAVORED BY FOREST EXPERTS

The time worn theory that "lightning never strikes twice in the same place" has been modified by forest experts of the United States department of agriculture to this extent: Lightning very often strikes in nearly the same places. It has its zones, in other words, where its appearance may usually be counted on with each electrical storm.

With the accumulation of data on causes and locations of fires in the national forests, these lightning zones could be mapped out and protective measures introduced — such as fire lines, regulated grazing and cleaning out of dead trees—which would more or less automatically control lightning fires at the start, the foresters believe. If these lightning zones were so mapped they would doubtless show a markedly close relation to certain types of topography, and sometimes more or less localized sections of many forests.

Next to campers and sparks from locomotives, lightning ranks third as the source of fires in the national forests. The records of the forest service of the department show that for the years 1914-1918, inclusive, lightning caused on the average 30 per cent of all fires reported. However, during 1920, a very unusual season, over 50 per cent of the 6,078 fires that occurred in the national forests were set by lightning.

NATURE GUIDES IN YOSEMITE

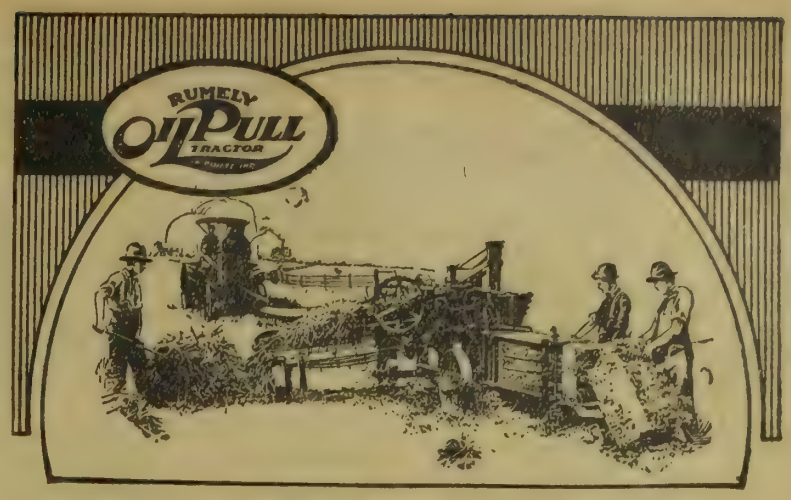
Dr. H. C. Bryant of the University of California, who knows intimately Sierra trails, will be at Yosemite national park again this year on Nature Guide Work. Dr. Loye H. Miller of the Los Angeles branch of that institution will entertain visitors with his imitations of wild bird music. Last year these scientists conducted nature study field excursions. They directed sleeping bag trips into the high Sierras which are Yosemite's back-of-beyond. They kept office hours in Yosemite Village to answer questions. They also conducted a wild flower show continuously throughout the season. They assisted 27,047 visitors to a better knowledge of the miracles of Yosemite's out-of-doors. This will be offered again under the joint auspices of the national park service and the California fish and game commission.

The California Nature Study League which is cooperating in this work will again have compact nature study libraries to assist Yosemite visitors.

CALIFORNIA'S AVOCADO SCOUT

A recent letter from Wilson Popenoe, government plant explorer in quest of things good to eat, written from some little village in a practically unknown region of Southern Ecuador, said he felt about as much out of the world as he ever had felt or believed he would feel, that he was going over some trails which explained why the country could not advance, to say nothing of the other reasons. He is finding many new fruits of undoubted value, all of which are forwarded to Washington, to be later distributed to those applying who will properly care for and report upon their development.

A well kept garden in summer means a well filled larder in winter.



Cheap, Dependable Power on the Belt

A Rumely OilPull tractor will materially decrease the cost of every belt operation on your farm—baling hay or straw, filling the silo, grinding feed, etc.

For the OilPull is specially adapted, through superior design, for belt work. The belt pulley is placed well up on the right hand side so the operator, without leaving the cab, can line up, back into the belt and start and stop the belt. Then there is the patented front axle shifting device which gives ample belt clearance without the necessity of sacrificing any of the strength of the OilPull frame.

The OilPull is built from the ground up to use cheap kerosene for fuel and the world records it has held for the last nine years prove its efficiency in burning kerosene.

It is famous for dependability and long life. You never hear of stopping the baling job to tinker with the tractor, if it's an OilPull. And an OilPull works on and on for years—in fact, many of the first OilPulls built twelve years ago are still working regularly after a dozen years' continuous service.

These are a few of the OilPull advantages that should recommend it to you.

Four sizes—12-20, 16-30, 20-40 and 30-60 H. P. Each is an outstanding performer—a dependable power plant. Communicate with us.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Loan to Ex-Soldiers

There are newspaper reports that the state legislature has passed bills relating to loaning money to ex-soldiers and sailors. When will these funds be available and who has charge of it?—Subscriber, Corona.

After the legislature passes bills, it is necessary for the governor to approve them. They usually do not go into effect until 90 days after approval, so that at the present time none of these bills are laws of the state. It would probably be necessary for you to wait until summer before any definite information could be had.

Tax Exemption

How much property is a person allowed free of taxation? An automobile is jointly owned and I also own a mule. Can the tax collector require me to pay taxes upon both? — Subscriber, Thermal.

The only exemption from taxes generally prevailing is $100, the amount of furniture and fixtures in the home. The tax is not against the individual, but against the property. In the case of the auto, for any payments which you would make you would be entitled to collect one-half from the joint owner.

Trees on Line

I agreed with my neighbor to put in a row of trees upon the property line, each putting in one-half of the trees. I have put in my half row, but feel sure that my neighbor does not intend to put in his. I understand that my neighbor will have a right to one-half of the fruit growing on these trees. Is this correct and is there any way to avoid this difficulty?—Subscriber, Los Angeles.

In the case of trees planted on property line, each party in the absence of some contrary agreement is presumed to own one-half of the trees thereon planted and is thereby entitled to one-half of the fruit. The trees cannot be removed without the joint assent of the parties. Doubtless, a written contract acknowledged and recorded could be drawn which would entitle you to the whole of the fruit of the trees on this line. Such would be necessary in view of the fact that it is a grant of interest in real property.

Wind Break

A neighbor is planning to set out a wind break of eucalyptus trees two feet from the line. It is well known that beans do not grow within 15 to 20 feet of such trees—often further. Can we do anything to prevent him from planting these trees? Can we compel him to plant further from the line?—Subscriber, Santa Paula.

In a case in the state of Vermont, an injunction was issued preventing the planting of trees where it was shown that the roots and branches would be a serious injury to the lands of the plaintiff. In this county it is difficult to tell just what the decision of the court would be, as there are many conflicting decisions. A case is now pending in the appellate court which will probably determine the law in this state.

Orphan's Fund

A widow with three children from 12 to 16 years of age has a small unimproved ranch, from which her income is very small. Would she be entitled to a mother's pension? If so, how much and where should she apply?—Subscriber, Tulare County.

There is an appropriation both by the counties and by the state for assistance for the maintenance of half orphans maintained by the mother. The amount of this assistance is not to exceed $20 per month per child, one-half of which is paid by the state and one-half by the county. The mode of invoking this aid is to file a petition with the county board of supervisors, setting forth the facts in full, as to the necessity of aid. It is well to have this petition verified by the mother and also by five citizens of the county. It is thereupon filed with the board of supervisors, which has an investigation made and then makes such order as it deems best in the circumstances. If the board refuses aid, the mother has the right to appeal to the state board of control.

The boys are "knockin' um dead"

To produce large crops of quality fruit, trees and vines must be free from insect pests. It takes less money to clean your trees now there's only a few bugs, than it will when there's millions of 'em.

There's a dry spray for every one of the pests, and the "boys that know what's what are using NICO-DUST DRY SPRAYS, for Nico Products knock 'em dead.

Neither is it necessary to use expensive machinery to apply these dusts. It is possible to cover 15 to 20 acres in a day as well as to completely dust trees 20 to 25 feet high. Just use one-man hand operated Sprayers. They are sure shooters.

Every day delayed means shorter crops and poorer quality, so don't hesitate longer, but see any of the following dealers for NICO-DUST DRY SPRAYERS today:

Eleagnus in Coachella

Editor California Cultivator: I note your letter from Peter Bisset in the issue of May 7 re Tamarix and Eleagnus (page 617) wherein he says no Eleagnus has been distributed in Coachella Valley. I received 16 plants four years ago (some of the varieties introduced by Frank N. Meyer from China and Turkestan). These have grown vigorously and fruited the past two years with no care and very little water. I propagated some this spring from cuttings. They root very easily, grow fast, and, if pruned, make a shapely small tree. They are very ornamental, with silvery foliage and profusion of small, yellow, heavily scented blossoms in spring. The wood is hard and dense, making excellent firewood. Can send you cuttings if you wish them. Winter is the best time to root them as they are deciduous.—W. F. A. McIntyre, Thermal.

PLANTINGS IN KINGS COUNTY

County Horticultural Commissioner L. O. Haupt of Hanford, in a recent report says: "The planting season has closed showing a heavy planting of trees and vines, especially the latter. Shortage and high price of vines curtailed the planting somewhat. The following were inspected and planted besides stock grown by the growers themselves which was not inspected: Apricots, 25,956; peaches, 33,141; prunes, 22,777; miscellaneous (trees), 5,286; grapevines (rooted), 1,189,652. The Tilton was the principal variety of apricots planted; Lovells lead in the peach varieties, while prunes were limited to the French variety almost entirely. About half of the vines were Thompson Seedless, as this variety was the only one that could be secured at reasonable prices."

Bee Hives---Transferring

By Henry Perkins

I AM frequently asked which size of hive is best, an eight or a ten frame. I invariably answer that it is largely a matter of choice on the part of the beekeeper. The bees seem to do equally well in either size. There is this difference: the eight frame brood chamber being one-fifth smaller than the ten frame size, requires less bees to occupy it and therefore will require a super sooner in the spring.

During the heavy brooding and extracting season the eight frame hive will require two supers when the ten frame hive may need but one. If the flow is a heavy one all strong colonies should be supplied with two supers irrespective of size. I think the main reason why some beekeepers adopt the eight frame hive is that they are lighter and handle easier. This is quite an item, especially to the migratory beekeeper. Ninety-five per cent of the hives used in California are the ten frame size. Whichever size is adopted the other should be eliminated, for they don't work well together. The eight frame super is too narrow for the ten frame brood chamber and vice versa. I would advise the beginner to buy his first hive already put together and equipped with full sheets of comb foundation. With a correctly assembled hive as a pattern to work from it is a simple matter to put up others from flat material. A new hive should be given two coats of paint. White is the best color.

To transfer a colony from a box hive to a standard hive is not as difficult as some suppose. It should not be attempted except when bees are strong and during a flow. Set the new hive with full sheets of foundation cover off beside the box hive. Now pry the bottom off the box and set it on the top of the new hive. Close the spaces that may occur with strips of wood so as to compel the bees to use the hive entrance. Examine them in about ten days. If conditions are right you will find that they will have begun work on the foundation in the hive. When several combs are nicely drawn it is time to smoke the queen down and put on a queen excluder. To do this make several openings in the top of the box through which to blow smoke. Smoke vigorously for several minutes, meanwhile pounding on the box. Now lift the box a few inches and give it a jounce or two and the chances are ten to one the queen will be in the hive. Put on the queen excluder and restore the box to its original position above the queen excluder. In three weeks time all the brood in the box will have hatched and the combs will be filled with honey. The colony will now be installed in the new hive where it can be easily handled. The box may now be disposed of and a super put on in its place. It must be remembered, however, that this system will only work during a good flow and good weather.

One very common way of accumulating bees is by means of decoy hives. An old hive makes the best decoy. If you use new hives for decoys put an old comb or two in each one to give them the beehive scent. Set them in a grove, or, better yet, up in the crotches of trees, not too many in one place. There is no rule to go by in placing decoy hives. Some places seem to be luckier than others. I have placed as many as ten decoys in one eucalyptus grove and caught a swarm in every one, while in another grove near by I did not get a one. It is useless to put out decoys except just before the swarming season. I am often asked how to hive a swarm. It is easy. Let them settle first. Don't smash up the wash tub to bring this about. They will settle anyway before taking flight, 99 times out of a hundred. Now put a comb of brood in a hive with a full set of frames and set it so the swarm may be shaken down at the entrance. They will go in without any coaxing. If they settle on the limb of a tree too high to reach, get a basket and a ladder. Shake them into the basket and dump them in front of the hive as before described. If they return to the limb it is evident that the queen is still there.

Efficient Production of Extracted Honey

By G. W. Bercaw

WE have found the following method of producing extracted honey on a commercial basis the most practical for Southern California, assuming, of course, that there is a constant flow of nectar under normal climatic conditions. This plan, however, might not work out so well in colder climates.

Towards the closing down of the active period, or when the rainy period commences, put a full depth super hive over the brood chamber, or lower story. Do not disturb the brood chamber during the last extracting for the season, this extra super to be provided with full drawn combs ready to fill with brood, honey or pollen, as the colony may feel inclined to do during the winter season when it is warm enough for activity, and towards the spring time. Do not put queen excluders between these two supers, but allow bees and queen full access to both portions of the hive, above and below, in order that both may be filled as much as possible with brood at the very earliest flow in spring time, which in some localities is as early as February.

Keep a close watch over them, and as near as a person can estimate the time before a heavy flow of honey, allow about 21 days, and then put a queen excluder between these two super hives, allowing all the brood and stores in top hive that you possibly can, taking each frame out and shaking it at the entrance of the colony, making sure that the queen is in the lower story of the colony, this shaking process to be done after the excluder is put between, getting and keeping the queen below without fail

As the young bees emerge these combs will be filled with honey and other stores, thereby increasing the capacity of the colony. This operation will produce an extra strong colony of bees, boiling over, so to speak, with queen below and excluder between the queen and the upper story, and when the flow comes these bees will fill the upper story in ten days so long as they do not cast a swarm of themselves and the flow in the fields is on. It might not all be capped over within this time, but rest assured nature has taught them when to cap it. This capping will depend largely upon the state of the weather and rapidity of evaporation: if this part of the operation (capping) seems slower than it should be, give them more space to work in by adding another super hive over the one already on.

When putting queen excluders on it is a good plan to examine the lower story for excessive amounts of drone comb and work it in to the upper super as much as possible. If full frames are removed they may be replaced with full sheets of comb foundation, and the good judgment of the apiarist will have to be depended upon.

It is presumed by the writer that all beekeepers who take good care of their yards work the drone combs into the surplus department, or upper story, with the worker combs below in the brood raising department of the colony.

Perhaps a great many drones will appear in the second super after excluder is placed between, but by occasionally raising the hive cover they will all escape and not return to it. These drones are an essential part of the apiary, if of good stock, where young queens are mating more or less every day during the early part of the season.

We have given this plan compre-

(Continued on Page 727.)

The Aldrich: *upright* or *grand*—a good piano modestly priced

THE Aldrich piano—upright or grand—is made according to our own specifications.

It is made according to standards that we have evolved out of forty-three years of painstaking piano merchandising.

Upright or grand, in any of its several models, the Aldrich, in our belief, successfully fulfills this ideal:

An instrument that we can recommend, at a price certain to be attractive.

Citrospray *versus* Fumigation

After a careful inspection of orchards sprayed with Citrospray for Citrocola Scale one of the oldest and largest growers in Southern California writes:

"In looking over the orchards that have been sprayed with Citrospray will say that I found it very satisfactory.

"Comparing it with adjoining orchards, which were fumigated, will say that the sprayed orchards showed just as good as they did."

This grower will use Citrospray on several hundred acres this year as a result of his investigations.

The cost of spraying with Citrospray is about 50% of the cost of fumigating.

What are you going to do, Mr. Reader?

MEMORIAL DAY

On this returning floral day,
When golden morn adorns the blue,
We softly come and fondly lay
A tribute on your graves anew.

Roses that whisper hope we bring,
Carnations rich and lilies rare,
Garlands of memory scattering
Their incense on the sacred air.

For us your daring march was made
In deadly storm of shot and shell.
For us to live sweet life you paid
In fadeless glory where you fell.

While countless ages roll along,
Earth's royal pageants pass away,
Your matchless deeds extoll'd in song
Shall consecrate this holy day.
—St. Paul Pioneer Press.

HOW TO MAKE A DRESS FORM

THE greatest difficulty of home dressmaking is fitting one's self. This is largely overcome by having a satisfactory dress form. A form which is a perfect likeness of the figure may be made by using a knit undervest as a foundation and covering it with several layers of gummed paper.

As the person for whom the form is to be made must stand during the process, the dress form should be made quickly. To do this the services of two to six people are needed. It is essential to have all materials and equipment at hand and conveniently placed before beginning to make the form.

Materials Required

Cheap, tight fitting, knit undervest with high neck and short sleeves.

Material to form collar foundation. (Muslin or knit pieces from bottom of shirt or sleeves may be used.)

Large roll gummed paper ½ to 1 inch wide. ("50-pound" quality is most satisfactory. This may be secured at most first class stationery stores.)

Pieces of cardboard about 18 to 24 inches.

Water container and sponge. Pencil. Needle and thread. Scissors. Yardstick. Washbasin and towel. Tapeline.

Directions for Making

As the dress form is to be made on the figure the model should wear comfortable shoes with heels the height she usually wears. She should remove her outer garments, see that the underclothing is smooth and well fitting, then put on as a foundation for the dress form a tight fitting undervest with high neck and short sleeves.

To make it easier to remove the form when finished, cut off buttons and buttonhole strips from undervest and sew up the opening.

Record waist measure.

Cut half the roll of gummed paper into 6 to 18 inch strips with diagonal ends. Cut four longer strips to define the long lines of center front and center back and an additional long strip for the waist.

Paste a strip of gummed paper around the waist to form a tight belt. Paste a strip vertically on each side one-eighth inch from center line of front and back (see Fig. 1). The quarter inch spaces thus made may be left partly uncovered so that it will be possible to cut through them easily and remove the halves of the dress form.

Except for these quarter inch spaces, paste strips of gummed paper over the entire vest. When pasting the strips, let them overlap from one-half to two-thirds the width of the strip. (See Fig. 1.) Make the strips smooth and press them firmly in place. It may be necessary to clip the edges of the strips in some places to make them smooth. Extend the form to cover a small portion of the upper arm, having the model hold arms slightly away from her sides. This may be done by bending her elbows a little and resting her hands on the lower part of the hips.

Add a second layer of paper, placing the strips at an angle to the first strips. Make the dress form firm enough to retain its shape by adding as many more layers as are needed.

Unless the shirt already has a collar attached, cover the neck with a piece of material, fitting it carefully and attaching it to the form with gummed paper (Fig. 2). Cover this collar foundation with strips one-half inch wide, placing them perpendicular to the neck line. Allow them to extend one or two inches below it.

Mark the hip line so that it will be an equal distance from the floor all around (Fig. 2). Measure the distance from the hip line to the floor and record this measurement. Draw short lines at intervals across the center

front and back as a guide for joining the halves of the form (Fig. 3).

Cut through the quarter inch spaces left uncovered in the center front and back of the form (Fig. 3). Carefully remove the halves.

Cut along the marked hip lines.

Hold the halves of the form up to the light to find the thin spots. Reinforce them with additional paper.

Measure the waist line on the halves of the form.

If the waist measure of the form is larger than the recorded waist measure, cut a strip equal to one-quarter of the difference from each side of the front and back.

With short strips of gummed paper join the halves of the form, matching them at the pencil lines. Reinforce the center lines with vertical strips of gummed paper.

Trim the edges of the neck and arms and bind them with short strips of paper one-half inch wide.

To make a base for the form, place it upright on the piece of cardboard and trace around the bottom of the form. Cut the cardboard on this line and fit it into the bottom of the form, trimming off the edges of the cardboard if necessary.

Attach the base to the form with short strips of gummed paper.

The Cultivator Patterns

3121. Child's Dress with Bloomers—Cut in 4 sizes: 4, 6, 8 and 10 years. Size 8 will require 3¼ yards of 36 inch material for the dress and 1¼ yards for the bloomers. Price 10 cents.

3524-3284. Ladies' Costume—Blouse 3524 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3284 cut in 7 sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. To make the dress for a medium size will require 8 years of 36 inch material. Its width with plaits extended is about 2½ yards. TWO separate patterns 10 cents FOR EACH pattern.

3519. "Tiny Tots" Play Garment—Cut in 3 sizes: 6 months, 1 year, and 2 years. A 1 year size will require 2¼ yards of 27 inch material. Price 10 cents.

3344. Dress for Work or Porch Wear—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 6 yards of 36 inch material. The skirt with plaits extended measures about 1¾ yards. Price 10 cents.

3370. Girl's Blouse Suit—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size will require 3⅞ yards of 38 inch material. Price, 10 cents.

3514. Misses Dress—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size will require 5⅛ yards of 40 inch material. The width of the skirt at the lower edge is about 2½ yards. Price 10 cents.

3507. Ladies' Corset Cover—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A Medium size will require 1⅞ yards of 36 inch material. Price 10 cents.

3510. A Comfortable Apron—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A Medium size will require 6¾ yards of 27 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

For use in fitting waists the form may be placed on a table. To make it convenient for fitting dresses or skirts it is necessary to mount the form on a standard. Make the standard the exact height of the distance from the hip line to the floor.—Dept. Home Economics, Ohio State Univ.

EGG BREADS FOR SPRING BREAKFASTS

Eggs and milk are plentiful and now is the time to make egg breads. The milk and eggs that go into muffins and cakes are not lost; you get it all back in the bread. There is more food in cornmeal muffins than in wheat biscuit and less meat can be served with such breads.

Below are suggestions for seven breakfasts and recipes for seven egg breads.

Sunday

Cornmeal Waffles, Honey, Rice and Milk: One-half cup cornmeal, ½ cup flour, 1 tablespoon melted butter, ½ teaspoon soda, 1 cup boiled rice, 2 eggs well beaten, 1 teaspoon salt, 1 cup sour milk. Sift together the flour, soda and salt; add the other ingredients and beat thoroughly; have irons hot and well greased.

Monday

Corn-rice Muffins, Baked Potatoes, Chicken Hash: One cup cornmeal, 1 cup boiled rice, 1 cup milk, 2 eggs, 1 tablespoon fat, 1 teaspoon salt, 2 teaspoons baking powder. Mix cornmeal, rice, milk and shortening together; beat five minutes; then add well beaten eggs, beat two minutes, then add the baking powder. Bake in hot greased muffin tins or in shallow pan. Boiled hominy may be used in the above recipe instead of rice.

Tuesday

Buckwheat Muffins, Boiled Hominy, Bacon: One cup milk, 1 tablespoon fat, 1 tablespoon syrup, 1 egg, 1 teaspoon salt, 4 teaspoons baking powder, 1 cup wheat flour, ⅞ cup buckwheat flour. Sift dry materials together. Add to the cup of milk the melted fat, syrup and beaten egg. Combine these two mixtures, stirring lightly without beating. Bake about 30 minutes in a moderately hot oven.

Wednesday

Spoon Bread, Baked Potatoes, Salt Fish: One cup white cornmeal, 1½ cups boiling water, 1 cup sweet milk, 1 teaspoon salt, 2 teaspoons baking powder, 2 eggs. Sift meal into a bowl. See that the water is boiling vigorously. Pour over the meal, stirring at the same time. When lukewarm, add the sweet milk, the well beaten egg yolk and beat thoroughly. Add the baking powder and last fold in the stiffly beaten whites. Pour into a hot well greased baking dish and bake in a moderately hot oven 30 minutes. Serve from the baking dish with a spoon.

Thursday

Rice Crumpets, Syrup, Oatmeal: One and one-half cups milk, 1 tablespoon fat, 3 eggs, 1 teaspoon salt, 2 teaspoons baking powder, 1 cup boiled rice, 1 cup cornmeal, ½ cup flour. Combine as for muffins. Cook on hot greased griddle.

Friday

Barley Muffins, Hash Brown Potatoes, Bacon: One cup milk, 1 tablespoon fat, 1 tablespoon syrup, 1 egg, 1 teaspoon salt, 4 teaspoons baking powder, 1 cup wheat flour, 1½ cups barley flour. Follow directions for making buckwheat muffins.

Saturday

Oatmeal Muffins, Creamed Potatoes, Scrambled Eggs: One cup milk, 1 tablespoon fat, 2 tablespoons syrup, 1 egg, 1 teaspoon salt, 4 teaspoons baking powder, ½ cup wheat flour, 1¼ cups oatmeal. Sift the salt, baking powder and the flour together, mix in the oatmeal. Add to the cup of milk the melted fat, syrup and beaten egg. Combine these two mixtures, stirring lightly without beating. Bake about 30 minutes in a moderately hot oven. Use granulated oatmeal or put rolled oats through food chopper.

It isn't wise to speak the truth at all times. Silence is often more satisfactory.

HOUSEHOLD QUERIES

Another Poem Requested

Would some of the subscribers of the home department please send the words of the song, "The Mill Never Grinds With the Water That Has Passed." I am very anxious for the words of that song.—Subscriber, Long Beach.

We presume the poem given below written by Sarah Doudney, afterwards Mrs. Clark, is the one requested. Other references to grinding with water which has passed are found in Turkish and Persian Proverbs by Trench. One in particular is:

"Oh, seize the instant time; You never will
With waters once passed by impel the mill."

Another reference in the works of Herbert: "The mill will never grind with water that is past."

The authorship of the song has been claimed by several writers. However, Miss Doudney is now recognized as the author. The song written by her is:

THE LESSON OF THE WATERMILL

By Sarah Doudney

Listen to the watermill
Through the live-long day,
How the clicking of its wheel
Wears the hours away!
Languidly the autumn wind
Stirs the forest leaves,
From the fields the reapers sing,
Binding up the sheaves;
And a proverb haunts my mind
As a spell is cast:
"The mill cannot grind
With the water that is past."

Autumn winds revive no more
Leaves that once are shed,
And the sickle cannot reap
Corn once gathered;
Flows the ruffled streamlet on,
Tranquil, deep and still;
Never gliding back again
To the watermill;
Truly speaks that proverb old
With a meaning vast—
"The mill cannot grind
With the water that is past."

Take the lesson to thyself,
True and loving heart;
Golden youth is fleeting by,
Summer hours depart;
Learn to make the most of life,
Lose no happy day,
Time will never bring thee back,
Chances swept away!
Leave no tender word unsaid,
Love, while love shall last;
"The mill cannot grind
With the water that is past."

Work while yet the daylight shines,
Man of strength and will!
Never does the streamlet glide
Useless by the mill;
Wait not till tomorrow's sun
Beams upon thy way,
All that thou canst call thine own
Lies in thy "today;"
Power and intellect and health
May not always last
"The mill cannot grind
With the water that is past."

Oh, the wasted hours of life
That have drifted by!
Oh, the good that might have been,
Lost without a sigh!
Love that we might once have saved
By a single word.
Thoughts conceived but never penned,
Perishing unheard.
Take the proverb to thine heart,
Take and hold it fast,
"The mill cannot grind
With the water that is past."

DOLLARS VS. IDEAS

You have a dollar,
I have a dollar,
We swap.
Now you have my dollar,
And I have your dollar,
We have neither gained a whit.

But you have an idea,
And I have an idea,
We swap.
Now you have two ideas.
And I have two ideas.
That is the difference between
Dollars and ideas.

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

The New Pacific Dehydrators League

By Arthur W. Christie

INTEREST in dehydration, which gradually awakened during the late war, has recently grown phenomenally. During the past two years about 150 new dehydrators, with an aggregate capacity of 1,350 tons per charge, have been erected in California, and these figures will be considerably increased in 1921.

This year California expects the largest fruit crop in her history. Probably the severe April frosts have seriously reduced expected production in certain sections, but this may only be a blessing in disguise. There is no escaping the fact that the profitable disposal of the 1921 fruit crop is a serious problem.

Financial conditions in the canning industry are such that many canneries will be unable to operate this year and those which will operate can do so only on fruit prices about one-third of last year's prices. The total amount of fruit which will be canned is expected to be 25 per cent less than in 1920.

The fresh shipment of fruit east will probably exceed any previous year, but this increase will be small in proportion to the increased production. Shortage of refrigerator cars and other transportation facilities, coupled with high freight rates, necessarily limit fresh shipment.

After a review of the entire situation it seems inevitable that a larger quantity of fruit must be dried than ever before. This is a logical disposition of the surplus crop because dried fruits can be produced, transported and marketed much more economically than in any other form. Unfortunately, many sections are insufficiently provided with sun drying facilities, especially trays. At present prices efficient dehydrators can be erected just as cheaply as to provide the land, trays, tracks, etc., necessary to dry an equivalent quantity of fruit in the sun. In addition to this we have the added advantages of dehydration in furnishing a cleaner, better product under controlled conditions. The year 1921 will emphasize the importance of dehydration to California horticulture.

The canners as well as the producers of sun dried fruits have already realized the importance of organization in the standardization and marketing of their products and are now reaping the benefits of their foresight.

If dehydrated California fruits are to attain the importance their quality merits two considerations are of paramount importance, namely: Standardization of the products of various plants; introduction of the products to the trade.

Realizing the necessity for action a group of representative dehydrator operators recently met in San Francisco and organized the "Pacific Dehydrators League." The objects of this league, which is copied very closely after the very successful Canners League of California, are to bring in closer touch those persons engaged in the dehydration of fruits, vegetables and other food products, to diffuse accurate and reliable information on dehydration, and to procure uniformity and certainty in the production and marketing of dehydrated products. The charter members of the new organization are: A. R. Sprague, Caladero Products Company, Atascadero; J. B. Howell, National Ice and Cold Storage Company, San Francisco; C. Grange, Grange Dehydrating Company, Yountville; S. M. Simon, Burbank Canning Company, Burbank; J. T. Cowles, Setchell de Journell Company, Santa Rosa; W. H. Ewell, Ewell Fruit Company, Watsonville; E. D. Valliant, prune grower, San Martin; L. A. Walton, fruit grower, Yuba City; Fred Brandt, Brandt Dehydrating Company, Healdsburg; R. L. Puccinelli, Puccinelli Dehydrating Company, Los Gatos; M. S. Yamasaki, California Evaporated Products Company, Los Angeles; C. A. Shephard, National Ice and Cold Storage Company, Gilroy.

At the first annual meeting on March 29 the first seven of the above representatives were elected as a board of directors from which the following officers were elected: J. B. Howell, president; C. Grange, first vice president; J. T. Cowles, second vice president; C. A. Shephard, secretary-treasurer; A. R. Sprague, C. Grange, J. T. Cowles, executive committee.

E. D. Valliant will represent the league in negotiations with dried fruit packers, W. H. Ewell will deal with apple problems, and S. M. Simon represents the league in Southern California.

The initiation fee was fixed at $100 and monthly dues at the rate of 10 cents for each $1.000 of capital in plant investment, minimum dues being $2.50 per month.

The league has already started active work not only in securing additional members but in planning helpful assistance to its members during the coming season. The University of California, as represented by Professor W. V. Cruess and the writer, has been made an honorary member in order that the league might keep in close contact with the investigational work in dehydration.

The formation of this league is unquestionably a step in the right direction and it is hoped that the league will grow in strength and service to the dehydrators of California.

All persons interested in dehydration are urged to get in touch with the Pacific Dehydrators League, the office of which is located in 406 Postal Telegraph Building, San Francisco.

EAT MORE CALIFORNIA FRUIT

The Bergtholdt idea is given new impetus by endorsement by some of California's largest producers. Mr. Hecke of the state department of agriculture, Mr. Daniels, state market director, the governor and others are fully endorsing it. We are glad to quote from letters as follows:

Governor Wm. D. Stephens

"Your plan is a good one, worthy of encouragement and adoption. If the housewives of America can be educated to realize the quality and value as food of California fruits — fresh, dried or canned—the demand for them will grow to such proportions as will, with fair and just freight rates established, insure the profitable cultivation of every acre of California soil adapted to fruit raising."

Geo. H. Hecke, Director of Agriculture

"I congratulate you upon coming to the front with a workable scheme for making more widely known the good things that inadvertently so many millions never see, hear of, nor use.

"It occurs to me that you are not advertising California fruits in the ordinary way, but in carrying out your plan you are going to tell housewives of the wholesomeness and goodness of these products, call them to their attention, and after they are introduced and once sampled they will advertise themselves. Science has determined that the fruit portion of a meal is as essential to the well balanced ration as meat, bread and vegetables.

"The California department of agriculture is advertising California fruits, and that is the most acceptable way from the consumer's point of view. Through the standardization regulations the purchaser, even at a great distance, is assured that 'what he orders he will get'—full measure, properly matured, well packed, fresh and wholesome.

"I agree heartily with your plan and wish you success."

Gilbert B. Daniels, State Market Director

"Any wisely conceived and concerted movement that will add to the cooperative marketing efficiency of the state of California naturally attracts the thought and interest of this office.

"To not only establish a market for the products of our orchards but to stabilize land values, to develop the fruit growing districts and put them on a solid basis, is a movement worthy the best thought of all California.

"Therefore, it is with more than the usual amount of interest that I unqualifiedly endorse the movement suggested by the editorial comment of the agricultural and horticultural press of this state. Be assured that you can count upon this office in promoting the idea in whatever degree possible."

AMERICAN DELEGATE TO ROME

William H. Stevenson, vice director of the experiment station of the Iowa State Agricultural College, has been appointed permanent delegate of the United States to the International Institute of Agriculture at Rome, according to an announcement just made by the United States department of agriculture. The appointment became effective May 1, and was made to fill the vacancy caused by the resignation of Dean Thomas F. Hunt, president of the State Agricultural College of California, who served as the United States member of the permanent committee of the institute while he was on sabbatical leave from the university.

It is planned that Prof. Stevenson will spend two or three weeks at the department of agriculture in Washington in order to become familiar with its organization, work and officials, and to get suggestions for the improvement and development of the service of the International Institute of Agriculture at Rome which will be of great interest and value to farmers and business men of the United States and other countries.

As the permanent delegate of the United States, Prof. Stevenson will be a members of the permanent committee of the institute, which is made up of one delegate from each of 61 member countries. This committee constitutes a board of directors which meets periodically to plan and carry out the work of the institute. The board is charged especially with carrying out the program outlined by the general assembly of the institute, which meets every two years. The permanent delegate will look after the interests of the United States, such as improvements in reporting crop conditions, production and prices of agricultural products in all countries, and in working out world tables showing surplus or deficiencies in crops. He is also one of the United States representatives at the biennial meetings of the general assembly.

PREVENT FIELD AND FOREST

Abundant and warm winter rains extending well into spring have made this an exceptionally good growing season in every section of California. Along every road and highway and covering the hills and valleys is a luxuriant growth of grass, grain and hay, all of which will be dry within a few weeks. Then it will burn like tinder. Any burning match, cigar, cigarette or tobacco will start a fire that will spread rapidly, soon get beyond control, and cause the destruction of much forage, grain, hay, timber, improvements and watershed cover.

During 1920 there were over 2,100 field and forest fires in California, of which about 700 were caused by lightning. The other 1,400 were caused by tourists, hunters, campers and others and nearly all of them could have been prevented if people had only been careful. The grain destroyed would have fed over 80,000 people a year and the timber burned would have built 5,000 good houses. The other property and commodities destroyed were worth more than the grain and timber. Very few of the lightning fires destroyed any property, leaving careless people to be charged with the whole loss.

Be careful in order to prevent field and forest fires—that is the slogan. Everyone is helping to boost it—the United States forest service, the state board of forestry, the schools, the automobile associations, the California Forest Protective Association, farmers, timber owners, merchants, resort managers and county supervisors.

CARGOES OF GIFT CORN

Bearing in her hold the first of the gift corn donated by the farmers of America through the American Farm Bureau Federation to relieve the starving in Central Europe, the steamship Gdansk of the Polish-American Line slipped her moorings at the Brooklyn Army docks, New York, recently and steamed out New York harbor on the first lap of her voyage to Danzig, Poland. No demonstration, save for the goodbyes of friends of her more than 800 passengers—mostly Poles returning to their native land—marked the sailing of the Gdansk on the farmers' errand of mercy.

The Gdansk's cargo consisted of 37,500 bushels of American grown corn in the form of corn flour, especially ground by a New York mill.

ROEDING IN JAPAN

A card to the Cultivator from an obscure village in Japan reads: "I wish you could be with me for a few days to enjoy visiting the many beautiful spots. There is such a variety of plant life and such a variety of scenery one cannot but help enjoying a spot like this—away from the bustle of the larger cities.—Geo. C. Roeding."

Coachella Valley onion shippers are not only going to grade their crop in accordance with U. S. standards this season but have decided to tell the trade through an extensive advertising program the superior merits of their product. An advertising fund is already available for use this season and it is planned to create an assessment of one-fourth cent per crate to continue advertising in the trade papers next year. This crop, reaching the Eastern markets about three weeks or a month after the Texas onion crop has started, always meets with considerable competition, but this year with the use of federal grades, a careful inspection system and a national advertising program, there is no question but that the Coachella Valley onions, which are really of superior quality, will compete more favorably than ever with the Texas crop.—H. H. W.

COMBINATION SALE
BURR FARM——AGEE BROS

60---REGISTERED HOLSTEINS---60

GUARANTEED BREEDERS—TUBERCULIN TESTED
SOLD ON MOST LIBERAL TERMS

Thursday, June 9, at 10 A.M.
at Burr Farm, Los Angeles, Cal.

Most of the offering is made up of fresh and heavy producing young cows, with a few heifers well along with calf, and only two or three open heifers. The females include:

A 27 POUND JUNIOR 3 YEAR OLD daughter of It, out of a 27 lb. 3 year old daughter of the century sire Changeling Butter Boy. Now fresh and on yearly test.

A 27 POUND granddaughter of Johanna McKinley Segis, now on yearly test and bred to King Korndyke Pontiac 20th.

A 26 POUND COW that milked 711 lbs. in 7 days. Now on yearly test and bred to King Pontiac Tola Ormsby.

A 25 POUND COW, now on yearly test and bred to King Pontiac Tola Ormsby.

TEN OTHERS with records above 20 lbs. butter in 7 days, and several with yearly records up to over 740 lbs. butter.

MANY OF THESE CHOICE FEMALES are in calf to King Korndyke Pontiac 20th, Sir Veeman Korndyke Pontiac, King Pontiac Tola Ormsby, Toyon Fayne Valdessa, or Sir Manuel Hengerveld, each of which is out of a 30 to 36 lb. dam or a dam that made over 1,000 lbs. butter in one year, or both.

EIGHT YOUNG BULLS IN THE OFFERING

Four of these are sired by Toyon Fayne Valdessa, every one out of an official record dam, one each by Sir Veeman Korndyke Pontiac, Segis Pontiac Abbekerk, Sir Veeman Helena Korndyke, and King Pearl Segis Pontiac, out of high class dams.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

TERMS OF SALE: One-third cash, balance in twelve equal monthly payments with approved note and livestock insurance on deferred payments, but arrangements for credit must positively be made before sale, otherwise terms are cash.

whose sons have sold for more money than those of any other bull of the breed
P.S.—Can also spare a few fresh cows of high production.

Work Out Dairy Marketing Plan

Delegates from 21 states and 61 cooperative dairy marketing organizations were present at the National Milk Marketing Conference held in Chicago, May 3 and 4, at the call of the American Farm Bureau Federation. The resolutions, passed without a dissenting voice or vote, provide as follows:

The president of the American Farm Bureau Federation, with the advice and consent of the National Milk Producers Federation, was authorized to appoint a committee of 11 men, representative of the dairy industry of the United States, to study the various dairy marketing organizations, provide plans for marketing organizations in organized territory, strengthen existing organizations, recommend plans for the correlation of the various dairy products cooperative marketing activities in a national way, and consider such other problems as may be deemed of value in the interest of the producers and the consumers.

The American Farm Bureau Federation was requested to appoint a dairy marketing specialist to cooperate with the Committee of Eleven and to function in the interests of marketing dairy products in general.

The American Farm Bureau Federation, in cooperation with state farm bureau federations and milk producers organizations, was requested to undertake a producers advertising and publicity campaign designed to increase the consumptive demand for dairy products.

The Capper-Volstead bill, clarifying the federal laws so as clearly to authorize the cooperative marketing of farm products, was endorsed.

Congress was asked to amend the warehouse act to include dairy products and thereby permit better marketing and financing.

A protest was filed against present freight rates on agricultural products, and the senate investigation was commended.

The manufacture of butter substitutes out of vegetable oils was opposed as injurious to the development and health of present and future generations.

Legislation was urged to prevent the manufacture and sale of filled milk and to prohibit the replacement of 40,000 American dairy cows by the "cocoanut cow of the South Sea Isles."

An hourly wage was demanded for the farmer and his help that will comport with the hourly wage of equally skilled labor in other industries, and a tariff was urged giving the products of the farm protection equivalent to that accorded the products of the factory.

The appreciation of the milk producers of the country was voiced to the American Farm Bureau Federation for calling the conference and inaugurating a movement for the more extensive and intensive organization of dairy farmers in cooperative marketing associations.

Secretary J. W. Coverdale of the American Farm Bureau Federation called the conference to order and was elected permanent chairman. A two day program had been carefully worked out by R. C. Pollock, E. B. Heaton and S. W. Tator of the American Farm Bureau Federation staff covering the cooperative marketing plans in vogue for the large cities, for cities of less than 75,000 population, and for small towns; the problems in unorganized territory; the cooperative marketing of butter and cheese, and the disposal of skimmilk and whey. The gathering proved one of the most vital marketing conferences ever held, and it is believed that its ultimate effects will be far reaching.

Report of C. C. A. Marketing Committee

This is the most critical time of the year for the cattlemen of the state of California. Some owners are apparently being forced to sell at the reduced prices offered by the packers. If possible, hold your cattle. There is no surplus of beef cattle in the state, and if owners will hold off selling for a month or perhaps less than a month the supply will be spread out over the proper time and seven cents for cows and eight cents to eight and one-half cents for steers will be realized for number 1 fat cattle.

Week ending April 30, 1921: Number of cattle slaughtered in San Francisco. 5,500; Oakland, 900. Week ending May 7, 1921: Number of cattle slaughtered in San Francisco, 4,525; Oakland, 750; Los Angeles, 2,525. Week ending May 14, 1921: Number of cattle slaughtered in San Francisco, 3,125; Oakland, 1,400; Los Angeles, 2,770; (674 from Idaho).

The above figures show a decrease each week in the receipts of cattle in San Francisco and an increase in Oakland and Los Angeles. Chicago price today is ten cents higher than a week ago. Prices in eastern northern markets have advanced steadily since April 28.

No contracts are being made. Only day to day or week to week "buys" are being brought into the market centers. From every channel and every source of information we are assured of this fact: There is a shortage of beef cattle in California.

Do not ship on consignment under any circumstances. Do not be misled by prices quoted in the daily papers f. o. b. San Francisco and other central markets, as in many cases their price quotations are erroneous, inasmuch as packers pay the same or higher prices in the country the same day. Do not offer half fat cattle for sale as beef as this invariably has a tendency to depress the market. Report to R. M. Hagen, Secretary, 224 Sharon Building, San Francisco, any sales of beef cattle.

Last week fat grass steers sold f. o. b. Los Angeles at eight and one-half cents for May and June delivery. Also fat steers sold f. o. b. Anaheim at eight and one-fourth cents last week Veal sold last week at Anaheim at ten cents. One car veal is being delivered to Los Angeles this week at 12 cents. In Imperial steers have recently sold at eight cents f. o. b. cars there. Los Angeles buyers have recently been operating as far north as Stockton and it is expected that buyers from Portland and Seattle will be in the market for California cattle in the near future.

GOATS AND GOATS

By Dr. C. P. De Langle

Probably the most numerous milk goats in the country are those which can claim no pure bred ancestry and are known as natives or common goats. "Native," however, applied to a goat that can trace no ancestry is a misnomer, as only the wild goats of the mountains are really natives, and these have never been domesticated. Among our common goats we find all colors, sizes, and sometimes traces of individual breeds of typical races. Some of these have furnished fine specimens. Beside the Mexican goat we have the Catalina Island and the Guadalupe goat, some of which have proven good milkers, and when all the does are bred to pure bred bucks they have developed into fine grades which are profitable for home or dairy use. Although these goats are multicolored and of varying shape the great majority are white, and though generally spoken of as scrubs they have furnished individuals giving 3 to 5 quarts per day and over. They are not profitable when giving less than one quart. They make good foundation stock when selected nearest to the breed desired and crossed with pure breds.

There are other types of goats that have been imported from time to time. The Alpine are claimed to be the greatest milkers of any in their native land. Then there are Spanish goats, goats with very short ears, a few scattered representatives of the Scandinavian and German goats, the most numerous being the Guggisburger, and many others all having some good points. But none are to be compared with the adopted type in this country, the Swiss breeds and the Anglo-Nubians, and all their variations which have been found to be the best dairy animal for domestic purposes. They are indeed man's best friend and the most intensive and economical milkers here.

Feeding Pigs

As the season of the year which brings a great percentage of the year's pigs approaches we naturally find the subject of the rationing of young pigs an interesting one. Little pigs do not need any feed other than their mother's milk for the first two or three weeks of their lives. When they have reached this age they will begin to nibble on shelled corn, a little of which should be fed them in a place outside the pen. By the time they are from three to four weeks old they may be fed a small amount of skimmilk in which has been mixed a little ground feed, such as shorts. They should have a trough of their own where it cannot be reached by the mother.

The amount of mixed feeds and shelled corn given small pigs may be increased till they are ten weeks old, when they should be weaned. When they are deprived of their mother's milk, which up to their weaning time supplies the basis of their nourishment, it is very important that they be fed a ration capable of producing the most rapid growth and best health. At the time of weaning the feed should not be greatly changed except to increase the amount until the pigs have become accustomed to the loss of the mother's milk. If pasture is available the quantity of corn may be increased. If the pigs must be kept in a dry lot, a larger proportion of soft feeds should be used.

It is to be remembered that the purpose in feeding pigs from the age of two months up to the age of six or seven months is not to fatten them but to cause them to grow large frames and develop good constitutions. If they are fattened too early it stops their growth and reduces their vitality, thereby making it unprofitable to continue feeding them up to full maturity. Growing hogs, therefore, require muscle and bone making feed instead of a ration that will fatten them. They need exercise to promote their growth and give them strong, vigorous frames for the taking on of fat. For these reasons pasturage should supply the basis of the young hogs' ration. Clover, alfalfa, peas, rape, vetch and other succulent plants are the cheapest and best feeds for the period between weaning and fattening time.

To this green feed will be added a certain amount of corn or other grain in order to make a balanced ration, but the poorest and most expensive way to grow pigs is to shut them in a dry lot and feed them a ration of corn alone. The farm lacking well arranged hog pastures is not ready for the business of making money out of pork. No matter what other ration may be fed pigs, milk is always desirable for milk is highly palatable and contains more of the necessary food elements than any other feed.

The following are suggested as rations suitable for growing hogs that have, in addition, access to good pasturage:

1. Corn, 60 per cent; shorts, 30 per cent; tankage, 10 per cent.
2. Corn, one-third; wheat, one-third; ground oats, one-third.
3. Corn, one-half; shorts, one-half.
4. Corn, 60 per cent; shorts, 20 per cent; linseed oil meal, 20 per cent.
5. Corn, one-third; milk, two-thirds.

My experience has shown that if pigs must be fed in dry lots, ration No. 1 will produce double the gain that can be secured from corn alone. —M. Stroud in Farmer's Guide.

NUMBER OF GOATS

Before the great war France had about 1,500,000 milk goats; Spain, 3,000,000; Italy, Switzerland, Germany, Austria, the Balkans and Greece have all bred large numbers. But the herds were sorely depleted during the war, and it will be some years before they can be built up to the high standards that had been reached before the war. Argentina has 4,000,000; Brazil, 10,000,000; India, 30,000,000. In the United States we have been slow to recognize their value, and the number of registered and thoroughbred animals is comparatively small—only a few thousand. The first importations were made in 1904, and some of the best stock now in this country are descendants of these early importations. Importation of goats has since been greatly restricted by the bureau of animal industry, department of agriculture.—Sherwood in Angora and Milk Goat Journal.

CARE OF MILK AND UTENSILS

First and most important in caring for milk is cleanliness. The stable, cow and clothing of the milker should be clean as well as the utensils. Milk is clean when taken from the cow and great care should be taken to keep it clean. We should be sure water used in the milk house is clean and pure. The milk house should be well screened and kept free from dust. All utensils, including separator, should be scalded and sunned daily. Milk should be strained through several thicknesses of cheese cloth and cooled quickly. Milk also keeps sweet much longer when cooled quickly. The cow should be brushed and the udder washed and wiped dry before milking. Also the cow should not be fed while being milked. The hooded milk pail helps keep out dirt, and milk cans should be kept covered—Missouri Farmer.

CHOICE SHORTHORNS FOR STRALOCH FARM

A carload of Shorthorns has just arrived from the East, consigned to Straloch Farm, Davis, of which Mr. C. Harold Hopkins is the proprietor. These cattle were bought from well known Eastern herds by J. I. Thompson. One yearling bull is included, Braywood Collynie, bred in Scotland and imported by Wm. Hartnett. He is a Broadhooks, sired by the Duthie bull Collynie Victor Star, whose full brother went to the Argentine some five years ago at 3,500 guineas. He will be used as the junior herd sire, following California Model. Among the cows is a two year old Potts' Emma heifer with a white heifer calf secured from R. N. Marshall of Iowa, in whose herd Imp. Gartly Lansdowne is making a great record. There are two heifers in the lot, one a Marr Beauty and the other a Broadhooks, that were in the first prize young herd at practically all of the central Western state fairs last year. These two and three others are by Choice Cumberland, bred by the Millers of Missouri, and who was undefeated in his class, and senior champion in 1916. His get were first and second at a very considerable number of the leading state fairs last year. Another daughter of his, a Jealousy, is a full sister to a Cumberland cow shown so successfully last year by the Millers. Outstanding among the others are a roan Orange Blossom, a red Lady Dorothy, two Marr Missies and two Clippers, one of the Clippers being sired by Radium. There are three six year old cows in the shipment, each one of which has raised one or more outstanding show calves. Eight head are mated to Villager's King, an outstanding son of Villager, and rated one of his very best breeding sons.

The addition of such choice material will greatly strengthen the Straloch herd, which already contains a distinguished collection.

SIMPLEX SILO

pronounced by agricultural experts "scientifically correct"

Two Kinds of Saving

25% Reduction in the Price of the SIMPLEX is only one of them

The first saving in buying a Simplex Silo is the 25% reduction in price. The second is the year-after-year saving of ensilage, due to the fact that the Simplex is built scientifically correct.

The one-piece staves of the Simplex eliminate end joints and prevent spoiled silage through leakage. The Clear Oregon Pine gives its inner walls a smoothness that makes air pockets and honey-combing impossible.

The Crisell Tangent Top automatically keeps the Simplex in a true circle. The steel hoops and Patent Interlocking Anchorage System bind the Simplex rigidly to its base, giving it strength to resist inside pressure and high winds.

These points, complying with scientific requirements of what a correct silo should be, plus the 25% reduction in price, make the Simplex the soundest silo investment on the market today. To know complete details will actually mean money in your pocket when you are ready to buy a silo. Mail the coupon now.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

June 9, Burr Farm and Agee Bros., Burr Farm, Los Angeles.

Shorthorns

May 25, Caledonia Farms, West Sacramento.

May 26, Howard Vaughn, Dixon.

Herefords

May 27, Finnell Stock Farms, Galt.

The annual ram sale conducted by the California Wool Growers Association will be held at the university farm, Davis, June 16 and 17. It is planned to offer several hundred head of rams, together with a number of ewes, representing the various breeds.

V. F. Dolcini of June Acres Stock Farm, Davis, has been doing some official testing in his small Holstein herd and reports the following results: A junior four year old daughter of King Korndyke Sadie Vale 22d, 22.75 pounds butter; two senior two year old daughters of Sir Imperial Snowball, a grandson of Rag Apple Korndyke, made 12.50 and 11.3 pounds of butter eight months after calving; a senior two year old by the same sire made 17.10 pounds and a junior three year old made 17.63 pounds; another junior three by the same sire made 20.36 pounds butter from 431.5 pounds milk.

William Carruthers of Live Oak has claimed November 2 as the date for his fourth public sale of Shornhorns. It is Mr. Carruthers' intention to offer 30 head of females and 15 bulls of his own and all of Scotch breeding.

The Sunny Brook Ranch, Willits, owns a half-sister to Pietertje Prospect Colantha, the bull that sold for $27,000 in the recent Brentwood Sale. This cow, Cantata Domino Sir Skylark 3d, being by the same sire, Dutchland Governor Sir Colantha. She recently dropped a bull calf sired by the Sunny Brook junior herd sire, Ensign Korndyke Model Pontiac, a son of Chimacum Spring Farm Pontiac and Korndyke Model Hartog 2d, the 27.5 pound sister to Lady Aaggie Echo Hengerveld, world record three year old.

McCloud Bessie Quidee, a Holstein cow owned by the McCloud River Lumber Company, Sisson, has recently completed a seven day record of 31 pounds of butter from 600 pounds of milk, and a 30 day record of 124 pounds of butter from 2,793 pounds milk.

L. W. Wing Jr., manager of the Elkhorn Farm, Watsonville, reports the sale of three Ayrshire heifers and a bull to the K. F. & L. Company, Hawaii. The bull is Ithan's Secretary of Elkhorn, a son of Highland Ithan, the grand champion at several of the leading fairs in 1919. The heifers include Elkhorn Heatherflower, Elkhorn Thistledown and Elkhorn Patricia. The first two heifers were in the Elkhorn show herd of 1919.

Segis Pietertje Prospect, the world's record milk producer, owned by Carnation Stock Farms, Seattle, has freshened again after completing her wonderful production of over 37,000 pounds of milk in one year, and on official test has increased her former seven day butter record to over 39 pounds.

Adirondac Wietske Dairy Maid, the famous Holstein cow owned by Bridgford Holstein Company, Patterson, recently dropped a fine heifer calf by King Segis Alcartra Prilly, thus a full sister to the yearling heifer that sold for $4,500 in the recent Brentwood National Sale. She is now on official test and at the present writing had enough to her credit to give her an average of over 39 pounds butter in seven days for her last three consecutive freshenings, an average that is unapproached by any other cow in the world. She is also credited with three consecutive seven day records above 800 pounds of milk, and is starting off fully as well as last year, when she made nearly 1,300 pounds of butter in 365 days.

Miss Valley Mead De Kol Walker, the famous dam of King Korndyke Pontiac 20th, Sir Aaggie De Kol Mead, and Prince Aaggie Mead, owned by A. W. Morris & Sons, Woodland, has just freshened, dropping a heifer calf to the service of Sir Pietertje Ormsby Mercedes 43d, the son of Sir Pietertje Ormsby Mercedes, formerly owned by Toyon Farm Association.

In anticipation of a large entry list in the livestock show at the Southern California Fair at Riverside, the directors have voted to increase the premium list by the addition of one place in each class. This makes the prizes in the aged classes $20, $15, $10 and $5 for the four places and will materially increase the prize money of the lucky ones.

H. H. Kildee of Ames, Iowa, has been invited to judge the dairy cattle and an Eastern judge for the hogs is being sought.

R. N. Clapp of Nuevo has just received a very nice Holstein cow in a shipment from the East. She is Nancy Calamo Korndyke and was sired by Paul Calamo Korndyke, who was many times grand champion at the national show. She is out of Nancy Spofford, a great show cow. The young cow is a show cow herself, having been undefeated at the national as well as at all the big Eastern shows as a junior calf, junior yearling and two year old. She has never been tested but should make a good record as she is a half sister to Nancy Lucy Hengerveld, the 40 pound Maxwell cow.

Alex Wilson of the Italian Vineyard Company has shipped a fine fall boar, which he calls Guasti's Leader Champion 23rd, to the Arcady Farm at Roundout, Illinois. The youngster combines the Grand Leader and Laurel Champion blood lines, being by Grand Leader's Grandson and out of a Laurel Champion sow. His new owner is Arthur Meeker, who is vice president of Armour & Co. The young boar is a very good example of the type of Berkshire so much in demand.

GROWING AND FEEDING ROOTS

There are thousands of small farmers—dairymen, feeders and others—who should grow and feed roots to stock. As a rule this class does not appreciate the value of roots in the ration of milk cows, feeder steers and sheep. Roots are primarily intensive crops, large quantities being grown on small areas. Larger farmers with their silos do not need roots for their stock in the same sense that smaller farmers do.

The roots best adapted for stock feeding are beets, carrots and turnips. Beets are the standby with cattlemen and some poultrymen. The varieties grown for this purpose are in the mangel and sugar beet classes. Mammoth Long Red gives the largest yield and the flesh is deep red. Golden Giant is a yellow mangel much relished by stock and poultry. Of the true sugar beets, Giant White is probably best for stock feeding. This yields almost as heavily as the true mangels and the roots contain a larger percentage of nutritive feed.

Carrots are a crop less easily harvested, as a rule, but one variety, White Belgian, grows one-third above ground and is not difficult to dig. This is worth growing as a change from the beet ration. We like, also, to feed carrots to the horses. When not working hard in the winter the grain ration can be lessened if carrots are available for feeding. Yellow Belgian is another variety used only for feeding to stock.

We do not consider turnips of so much value as mangels and carrots, but they are so easily grown that farmers will do well to consider them to feed to the young stock and also to the sheep. We have also fed them to the dairy cows without any ill effects. Turnips are exceptionally easy to grow. Prepare the ground in early August in the northernmost states and sow the seed broadcast. Farther south the work may be done later. Purple Top Globe is a quick growing variety. Cowhorn is another. The yellow sorts like Yellow Stone and Purple Top require a longer season for development.

Any soil that will produce a good crop of corn will grow mangels and carrots. It is well to plant the seed in May, in order to give the roots a whole season for development. These are intensive crops but when consid-

erable acreages are grown it is necessary to economize in labor as much as possible. For this reason, then, the rows should be far enough apart to use the horse cultivator. Ground not naturally full of weed seeds will produce a crop without much hand work. Sow the seed thinly and hack out spaces so the plants will finally stand ten inches apart in the case of mangels and eight inches in the case of carrots. Common carrots may be grown closer together. It may be necessary to pull a few weeds and surplus plants by hand, but the cultivator and the hoe in hand can do the most of it. Turnips of the rutabaga class can be grown in about the same way as mangels and carrots. The land does not need to be as rich, however, and rutabagas do best on new land just plowed

I have fed all kinds of roots to cows giving milk without any unpleasant results. Even turnips can be fed daily without harm to milk or butter, we believe. Our method is to feed a half peck or a little more just after milking in the morning. It is the heavy feeds of roots which cause the milk to show an undesirable flavor. Right feeding is harmless in this respect. Heavier feeds may be given to the steers, young stock and horses. For horses carrots are the best feed. Mangels are probably best for sheep.—C. H. Chesley in Indiana Farmer's Guide.

SELLS DUROCS

Renewed interest in Guernsey cattle has caused W. H. Dupee of Santee to sell his entire herd of Edgemoor Durocs to Cash and Kyne of Perris. The herd included the great young boar Royal I Am, which Mr. Dupee bought from Donald Graham, and High Sensation Lady, the gilt purchased from the Winsor Ranch last year. There were 168 head in all, including some litters by Scissors and 11 beautiful junior yearling gilts, seven of which were out of the Winsor gilt by Great Sensation 3rd. Mr. Dupee has a shipment of 26 two year old Guernsey heifers on the way out from the East to supplement the 40 head now on the place.

He has very recently been offered a price far above that ever paid for a Guernsey bull for the young bull, Masterpiece of Edgemoor, which he is keeping to head his herd. Masterpiece was sired by Royal Rose King of Edgemoor, who was by Imp. Itchen May King, the grand champion at the 1920 National, and was out of Balladia, who made 934 pounds of fat and is the state champion aged cow for the breed. He is out of Jessebel of Edgemoor, a 748 pounds two year old daughter of Ne Plus Ultra, and therefore combines many of the great May Rose blood lines.

CHAMPION OF ARIZONA

Theresa Belle 3d, owned by the University of Arizona, is making a great record. She made 117 pounds milk in a day, and is now on year test and going strong. She freshened November 20 and was started on test November 24. In four months she has made 11,933.3 pounds milk, 336.5 pounds butterfat. Her official records are 790.5 pounds milk, 29.37 pounds butter in seven days, 3,258.3 pounds milk, 123.57 pounds butter in 30 days.

Theresa Belle 3d was bred by F. W. Allis of Madison, Wisconsin, and was purchased with a number of other cows by the University of Arizona in 1917. To give some idea of the record this cow is making, we publish the monthly score of her production:

	Pounds		
	Milk	Butterfat	Butter
Nov., 7 days	453.5	19.17	23.9625
Dec.	2946.4	97.098	121.3725
Jan.	3342.8	99.744	124.43
Feb.	2639.6	79.821	99.775
Mar., to 28th	2551.	70.663	88.325

—Holstein-Friesian World.

Hogs that are given skimmilk, tankage or leguminous pasture commonly possess strength of bone sufficient for heavy feeding. Feeding additional mineral supplements, however, increases the strength of bone.

Through the feeding of mineral supplements to swine it has been found possible to prevent much of the loss caused by breaking down of hogs before or when they are sent to market.

ANNOUNCEMENT

SIR AAGGIE DE KOL MEAD 286173

We have sold to Mr. Fred Hartsook, Lankershim, Calif., a half interest in **Sir Aaggie De Kol Mead,** founding a plan which we are confident will result in substantial results in Mr. Hartsook's herd, in our own herd, and that will be of very large benefit to the many breeders who have introduced the Aaggie Acme-De Kol of Valley Mead breeding into their herds within the past few years.

It will be remembered that only a short time ago we announced the sale to Mr. Hartsook of a half interest in **Sir Prince Aaggie Mead.** The latest transaction involving the interest in **Sir Aaggie De Kol Mead** thus makes it possible for both Mr. Hartsook and ourselves to have in our herds in constant service a son of **Miss Valley Mead De Kol Walker,** each one sired by a bull carrying the strongest Aaggie Acme breeding.

Miss Valley Mead De Kol Walker now has three sons in active service, the two mentioned above owned by Mr. Hartsook and ourselves, and **King Korndyke Pontiac 20th,** owned by Burr Farm, Los Angeles.

King Korndyke Pontiac 20th has nearly a dozen good sons heading high class breeding herds in California and Nevada, including the $41,000 bull **King Korndyke Pontiac Acme,** heading Anita M. Baldwin's herd at Santa Anita Rancho.

Sir Aaggie De Kol Acme, sire of Sir Aaggie De Kol Mead, has even a larger number of sons heading high class breeding herds in California, New York, Kansas and other states.

Breeders have been attracted to this line of breeding strictly upon the merits of the Aaggie Acme and De Kol of Valley Mead families as producers and proven transmitters of great production, and this blood is now so firmly placed in so many good breeding herds that individuals carrying it possess a stable and substantial value that is not present in individuals whose family connection in the breed is not so well regarded.

You may link your own herd up with these popular and valuable families through the use of a herd sire bred strongly in the Aaggie Acme-De Kol of Valley Mead lines. Let us talk it over with you, for perhaps we have on hand right now just the young bull that will fit most profitably into your breeding herd.

A. W. Morris & Sons Corporation
Woodland, California

HIS DAM

Miss Valley Mead De Kol Walker 250936

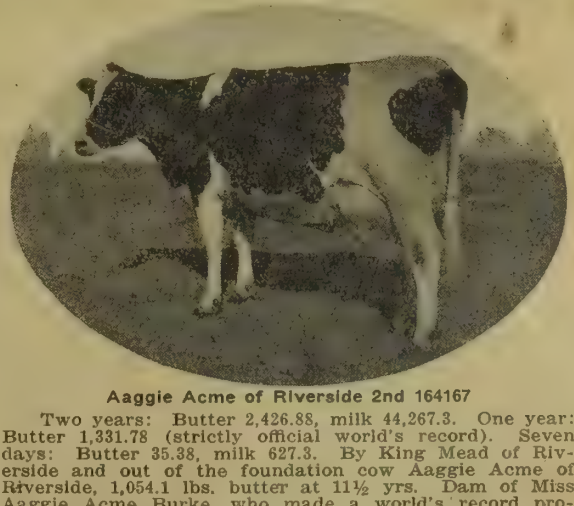
Two years: Butter 1,903, milk 38,986.7. (Records made at 2 and 3 years of age, both short years because of calving within 12 months of previous freshening.) One year: (At 3 years) Butter 1,113.58, milk 21,975.8, second highest butter record in class when made. Seven days: (At 3 years) Butter 36.81, milk 688.6. Won California Dairy Cow Competition over all ages and breeds as a junior 3 year old. Broke world's records eight months after calving both as a 2 and 3 year old. Widely rated as one of the breed's greatest females.

HIS SIRE

Sir Aaggie De Kol Acme 185724

12 A. R. O. daughters, his first five to finish 305 day records averaging well over 600 lbs. butter and over 16,000 lbs. milk as first calf 2 year olds. His sons head many good herds, including the $9,250 Sir Aaggie Mead, owned by W. J. Higdon, the $11,000 Sir Aaggie Mead De Kol, owned by Arfmann & Amos, New York, and others that have sold well up into four figures. One of his daughters topped the F. W. Kiesel females, and ten of his young daughters sold for an average of over $800 in the same sale. He is the first bull in California to have sired 100 living daughters, and they promise to be real producers. He is sired by a son of Aralia De Kol and is out of the great dam shown below.

HIS SIRE'S DAM



Aaggie Acme of Riverside 2nd 164167

Two years: Butter 2,426.88, milk 44,267.3. One year: Butter 1,331.78 (strictly official world's record). Seven days: Butter 35.38, milk 627.3. By King Mead of Riverside and out of the foundation cow Aaggie Acme of Riverside, 1,054.1 lbs. butter at 11½ yrs. Dam of Miss Aaggie Acme Burke, who made a world's record production of 24,338.9 lbs. milk as a junior 2 year old, making 1,034.66 lbs. butter, third highest for age in the breed, only 1,000 lb. junior 2 year old in California, and as a junior 4 year old she made 35.38 lbs. butter from 726.4 lbs. milk in 7 days and is again on yearly test. She is the dam of the $41,000 bull King Korndyke Pontiac Acme.

MOLASSES

"..... fell off in milk production about 15%"

The Wolf Rathbone Company, Patterson, Cal., operate a large dairy. Naturally they have done everything possible to raise milk production per head.

The results they have secured with Pure Hawaiian Molasses are interesting to every man who has cows. The letter says further:

"We ran out of Molasses for several days and found that the cows fell off in milk production about 15% at first, later increasing to about 11% below the flow when Molasses was fed. When Molasses was again fed, the cows slowly returned to the former flow of milk, or nearly so."

There is a moral here. It is: Feed Molasses, and be sure you **always** have it on hand!

Our booklet, telling how cheaply Molasses can be fed, and how to feed it, is yours for the asking. Write for it today.

April Winner of Cultivator Prize

By F. W. Woll

FIVE grade cows owned by J. A. Genzoli of Loleta, Humboldt County, had the highest average production of butterfat for grades in the state dairy cow competition during the month of April, viz: 83.04 pounds, and the California Cultivator prize for this month was therefore awarded to Mr. Genzoli.

The production by the individual grades for the month was as follows:

	Age Yr.-Mo.	Days in Milk	Milk Lbs.	Butter Fat Prct.	Fat Lbs.
Blue Spot	5-11	22	1896	4.9	92.90
Maggie	5-0	36	1383	6.1	84.36
Jill	5-0	25	1434	5.7	71.74
Fannie	7-0	17	1488	5.4	80.35
Sarah	5-1	27	1686	4.5	75.87
Average		25	1577	5.3	83.04

These cows are described by the owner as "common," but whatever their breeding may be, their production is certainly very uncommon. They stand first among groups of five grades in 26 different dairy herds that competed for the California Cultivator prize the past month. Of this number the average production of all but four came above 50 pounds of butterfat for the month, and only one fell below 40 pounds. Five grades produced, on the average, over 50 pounds of butterfat in the herds owned by the following dairy farmers: J. A. Genzoli, Loleta, 83.04 pounds; Arden Dairy, El Monte, 75.63; N. Hauk, Alton, 69.74; Leo Christen, Waddington, 68.75; H. L. Wakeham, Santa Ana, 67.06; Napa State Hospital, Imola, 66.87; Eug. Biondini, Ferndale, 66.50; W. F. Early, Grizzly Bluff, 65.31; Peter Iversen, Grizzly Bluff, 65.23; Earl Graham, Compton, 62.36; M. L. Pontoni, Arcata, 63.05; W. B. Gries, Ferndale, 62.10; W. Terkelsen, Ferndale, 61.68; Giacornini & Pedotti, Waddington, 61.49; J. B. Harbers, Waddington, 60.60; Adohr Stock Farms, Van Nuys, 58.50; F. F. Pellissier, Whittier, 58.05; El Mirador Dairy, Pasadena, 56.76; Los Angeles County Farm, Hondo, 53.76; S. H. Green, Grimes, 53.34; R. H. Walrath, El Centro, 53.02, and J. C. Broady, Palm City, 51.58.

These and other dairy herds that competed for the Cultivator prize the past month represent widely separated sections of the state, showing that no one locality has a monopoly on good cows. This is the first time that the prize has gone to Humboldt County, but it is not likely to be the last judging by the showing made by herds in this county during the past month.

158 Willowmead Holsteins Average $220

One hundred and fifty-four head of Holstein cows and heifers and four bulls were sold in the Willowmead sale at Sacramento, May 18-19, for a general average of $220. In view of the fact that the entire lot was sold without having been tested for tuberculosis, and only a small number having official records, the average was regarded as fairly satisfactory. It is doubtful if there has ever been a sale in this state in which such a large number of cattle were absorbed by so few buyers, 17 being represented in the sale list. However, the bulk of the offering was taken by seven buyers.

J. R. Bush of Merced was the heaviest buyer, taking an even 50 head at prices well over the average of the sale. C. A. Fisk, Bryte, a new man to enter the business, selected 29. Dr. E. J. Weldon of Sacramento took 17 of the better young things. Thos. Gordon of Hanford bought 13. R. Potter and R. Zangl of Los Angeles secured 11 and ten head each.

No unusual prices characterized the sale. The top price was $750, which was paid by Mr. Bush for the good cow, Minnewawa Louise 3d, with a 32.28 pound seven day record to her credit. The same buyer paid $625 for the 26 pound Copa De Oro Sairy Aaggie Jane, and $525 for the 24 pound Salambo Korndyke 2d.

Practically the whole offering carried the service of one or the other of the two Willowmead herd bulls, Colony Zarilda Newman, son of Zarilda Clothilde 3d De Kol, holder of the world's strictly official milk record of 33,427 pounds, or Prince Echo Sylvia Segis, a grandson of the famous May Echo Sylvia.

The sale included the entire milking herd owned by Mr. McGillivray, who still owns over 300 head of registered females.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company. Col. Ben A. Rhoades of Los Angeles wielded the hammer and was assisted from the ring by Col. John Davis of Manteca.

A representative list of sales follows:

3. Minnewawa Louise 3d, July, 1912, 32.28 lbs., 7 yrs.; C. J. Sullivan, Sacramento, $750.
4. Ruby Louise Pietertje Burke, Oct. 1915; C. A. Fisk, Bryte, $450.
5. Minnie Mecthilde Louise, Sept. 1914; C. A. Fisk, $450.
7. Fairy Princess Colantha, Sept. 1913, 20.05 lbs., 2 yrs.; R. Zangl, Bellflower, $380.
8. Princess Helena Pontiac Burke, Dec. 1915; J. R. Bush, Merced, $260.
9. Lady Bettina Korndyke, June 1913, 15.53 lbs., 2½ yrs.; C. A. Fisk, $200.
10. Dora Clay Korndyke, June 1913, 17.52 lbs., 2½ yrs.; R. Zangl, $295.
11. Dora Korndyke Pontiac Burke, Jan. 1917; R. Zangl, $225.
12. Carlotta Colantha Johanna, Nov. 1913, 17.16 lbs., 2 yrs.; C. A. Fisk, $200.
13. Johanna Jean Pontiac Burke, Feb. 1917; C. J. Sullivan, $345.
14. Inka Tritomia Maiden, July 1914; E. J. Weldon, Sacramento, $475.
15. Korndyke Juliana Colantha, Sept. 1914; C. J. Sullivan, $265.
16. Katrine Beauty Korndyke, July 1913; R. Potter, Los Angeles, $285.
17. Kathleen Korndyke Elsa, Sept. 1914; Thos. Gordon, Hanford, $210.
21. Hazel Irene Pontiac Burke, Mar. 1917; J. R. Bush, $210.

WHEN A PURE BRED IS NOT A PURE BRED

By R. P. Royce

The ever present and persistent pessimist who delights to make himself and others miserable by holding that there is no new thing under the sun may be disturbed to learn that his contention is no longer tenable. It has remained for the legislature just closed to bring to light a striking example of a brand new shining "thing," the like of which the world has never known. You see, for a good long time, in fact ever since the establishment of the first breed of livestock, the world in general and the livestock people in particular have been laboring along under the impression that they had a fair working knowledge of what constituted a pure bred animal. It has been the accepted impression that a pure bred animal was the offspring of sire and dam both of which were eligible to registration in the recognized herd, stud and flock books. Of course that application came about through universal and modern acceptance of the term. So far as we know there is no reference to the term in the early written records of history or literature. Neither has the term been established by agreement among modern nations. It just came to be accepted that p-u-r-e-b-r-e-d meant an animal whose sire and dam were eligible to registration, just as c-o-r-n meant corn and c-o-w meant a female bovine. Now comes Senator Rigdon, chairman of the agricultural committee of the senate, with a bill duly passed "to improve the quality and regulate the number and use of bulls running upon the open range" which says that "no person shall permit to run upon any open range of this state any bull over eight months of age that is not a pure bred bull of recognized beef breed . . . for the purpose of this act the term 'pure bred bulls' is hereby defined as bulls bred in a herd of one of the recognized beef breeds, the ancestral sires of which must have been registered bulls of the same breed for at least four generations, and the dams of which must have been cows of the same breed of good quality."

There is this consolation, the law makers at least believe that a "pure bred" bull should have four registered sires back of him—just how far back is not made plain.

Thousands of Dollars Added to Cattle Profits

OUT of every five bushels of *whole* grains fed your cattle, *one bushel goes to the manure pile without being digested and is a total waste.*

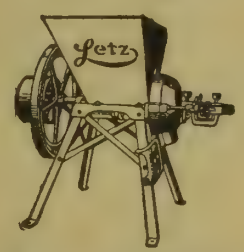
But *ground* feed is *all* digested. Feeding it, means a 20% cut in feed costs, also fatter, higher priced stock. Come in and let us show you without any obligation, how easy it is to get these results with the

LETZ *America's Leading Feed Mill*

The *fine cutting* of the Letz is due to the 848 keen cutting edges of the patented Letz Grinding Plates. In one operation cuts, grinds, *pulverizes* into finest meal all grains and grasses, wet or dry; and cannot clog.

Grinds corn, shelled or on cob—snapped corn—or complete stalk, ear, leaves, and all. Grinds oats, hulls and all; grinds barley, rye; special attachment for alfalfa, clover, millet, Kaffir corn and other roughage crops. Grinds into finest flour.

Plates are self-sharpening—can be run together empty for hours without injury—average 2000 bushels of moderately fine cut meal before replacement is necessary.



Grinds the finest flour. Has 10 big exclusive features any one of which makes the Letz superior to any other process. Let us prove it. See a Free Demonstration today.

Yucaipa Valley apple trees have set too large a crop and orchardists are thinning heavily. One grower counted 2,000 pulled from one tree and crop still too thick.

Prehistoric Life Enriches Present Day Soil

CALIFORNIANS delight in delving into the days of old, in fact into other periods when animals other than those occupying the earth today existed here. The tar pits of La Brea have yielded up the mastodons, the saber-toothed tigers and other prehistoric animals and they have been reconstructed in our greatest museums and educational institutions. Many of these have been declared to be the finest preserved of any discovered on this earth. We have sometimes felt that this sport is comparatively modern, but it seems that in the good old 49'er days the work had already begun. In Bret Harte's "The Society Upon the Stanislaus" he describes the society, some of its functions and one particular event in the society's existence in the following lines:

Now, nothing could be finer, or more beautiful to see,
Than the first six months proceedings of that same society,
Till Brown of Calaveras brought a lot of fossil bones
That he found within a tunnel near the tenement of Jones.
Then Brown he read a paper, and he reconstructed there,
From those same bones, an animal that was extremely rare;
And Jones then asked the chair for a suspension of the rules,
Till he could prove that those same bones was one of his lost mules.
Now I hold it is not descent for a scientific gent
To say another is an ass—at least to all intent;
Nor should the individual who happens to be meant
Reply by heaving rocks at him to any great extent.
Then Abner Dean of Angel's raised a point of order, when
A chunk of old red sandstone took him in the abdomen;
And he smiled a kind of sickly smile, and curled up on the floor,
And the subsequent proceedings interested him no more.

Now if we might change "red sandstone" to "gray limestone" we might apply a portion of the above to a development at present under way in the quarries near Lomita in Los Angeles County. Chunks of lime from these quarries are now being used to jar certain non-productive conditions out of orchard soils. Many thousands of tons of a deposit have been discovered. That deposit consists of a mass of pure lime, largely of decomposed marine shell. In this shell deposit is also found a mass of decayed or decaying bones. Occasionally these bones are found partially petrified but as yet none of these have been found sufficiently well preserved that any of the neighbors have endeavored to reconstruct one of Brown's mules.

The existence of these deposits has been known for several years but not until about a year ago has the work of bringing them out and making them available for soil correction been carried on under direction of S. Maus Purple. Liberal applications have been made on many of the orchards of Orange County and these orchards are today showing a liberal setting of fruit and a healthy condition. Amongst these orchards are those of A. S. Bradford near Placentia where 200 acres have had an application of 12½ tons per acre. The trees are loaded with fruit. Another was that of C. E. Basten, also near Placentia, where 20 acres, which he said was almost defoliated, had yellowed leaves, the trees endeavoring to grow in a soil which was the consistency of putty, had been brought out with a wealth of dark green foliage and set an immense crop by the application of 15 tons per acre. These trees are 21 years old. Fred L. Sexton, an orange grower with orchards near Anaheim (also enthusiastically pushing the sale of the decomposed shell) calls special attention to the Fullerton orchards of Ralph Carhart, where an application of five tons to the acre had wrought what he termed an almost miraculous change in appearance and the bearing of the grove. This orchard bearing only indifferent crops was one of the very first to make applications of the lime. Soil conditions had been materially improved and the trees were loaded almost to the breaking point with good sized, high quality oranges.

Analysis shows this lime to contain a trace of nitrogen, 1.84 per cent phosphorus, and 54 per cent of pure calcium. It has also about one-fourth of one per cent of sulphur. Prof. Gilbert Bailey of the University of Southern California declares it one of the most satisfactory forms of lime he has seen. In one particular especially did he call attention to the fact that this form of lime could be freely used with poultry manure or other manures where nitrogen is largely in the form of ammonia and easily lost. This form of lime would act more as an absorbent and preserve rather than dissipate the ammonia.

It appears that the benefit from the application of this lime has been partly in giving to the soil needed elements, but more in creating a soil condition congenial to the myriads of soil bacteria and enabling them to work.

EFFICIENT PRODUCTION OF EXTRACTED HONEY

(Continued from Page 715.)

hensive test and find it the best one we know of. If the colony should cast a swarm of itself it will not produce the amount of honey that it would otherwise.

In the manipulation of each individual colony it is presumed that the bees are of good stock, strong and healthy. If this is not the case, get them that way. Requeening every two years is the best plan for good vigorous stock. It is a very good idea to requeen in a yard of 200 stands about 100 each year. And we consider that it pays the beekeeper or producer of honey either to raise his own queens or purchase good healthy stock and not allow inbreeding. We prefer the three band Italian bee as the best all around bee as it seems more resistant to the ravages of bee diseases than others.

This plan of operations requires considerable time if bee yards are large, but if one expects a crop of honey it is work, work all the time, and you will only get out of your apiary just in proportion to what you put into it, the same as in any other occupation.

In California there is very little time during the year that bees cannot fly and our crops extend over several months, though some months are not so productive as others.

Queen excluders should be used in the production of extracted honey as this is the only method by which the queen may be kept away from the extracting super of the colony. When brood of any age is allowed in the extracting super good clean edible honey cannot be produced, but these excluders should not be allowed to remain on the colony during the winter or closed period.

I have written this article, assuming beekeeping on a commercial scale. It will apply to large or small beekeepers, even those of only 25 to 50 colonies.

The United States bureau of plant industry has from time to time received seeds of most excellent passion fruits and it is strange some of them have not been universally distributed in California, where all members of this family grow well.

In 1910 the department sent out photos and a description of Passiflora ligularis. From the latter we quote: "One of the best of the passion vine fruits. It is about the size of a hen's egg, with a parchment-like skin, containing a sweet acidulous pulp surrounding the seeds. It grows on a vine which clings by tendrils, and is cultivated on verandas and arbors, producing fruit in a few months after planting. The fruit is used in making sherbets and refreshing drinks. It is recommended for sub-tropical regions or for greenhouse culture."

Let no pleasure tempt thee, no profit allure thee, no ambition corrupt thee, no persuasion move thee to do anything which thou knowest to be evil; so shalt thou always live jollily: for a good conscience is a continual Christmas.—Benjamin Franklin.

Principles of Culling

By Jean A. Koethen

CULLING, as it is carried on on commercial poultry ranches between the months of May and November, is based for the most part on two fundamental principles: first, that the profitable layer must be a long distance layer—that is, she must lay a good many months without interruption; second, that whatever interferes with production is detrimental to profit and constitutes a reason for segregating the hen that is interfered with, if not for disposing of her altogether. When a hen stops laying the first question we have to ask is, "Why?"

Now some hens quit laying or lay only tentatively and without much spirit because they have not the constitutional vigor necessary to consistent production. Such a hen may be spotted by her lusterless eye, her feeble, desultory ways. Does she stand back in a corner when the others are squabbling over their dinner? Off with her head. Does she loaf on the roost in the morning when the others are scratching, or seek it before supper is over? Is her crop only half filled when she goes to roost? Is her comb pale and shrunken? Out with her. She is a slacker, not because she is lazy but because she is a weakling. On up-to-date ranches every hen that stops laying for any reason whatever before the first of July is eliminated. She is not a long distance layer.

But the two things most likely to interfere with the laying of a normally vigorous and healthy hen are broodiness and molting. Hence we cull first for broodiness and second for molting.

Eliminate the Broody Hen

On one ranch every hen that goes broody before the first of July is eliminated. If she goes broody so early in the season she will go broody again, and the hen that stops laying every month or so and begins to cluck will never lay 200 eggs. Most likely she will not reach 120. The hen that goes broody after July 1, but goes broody only once, is permitted to remain, but she is banded and not allowed in the highest class. The hen that goes broody twice is eliminated.

Cull for Early Molting

On another ranch early molting is made the supreme test, second only to vigor. No hen that molts before September 1 is allowed to remain in the flock. The hens that go into the molt after September 1 are divided into three classes: those that molt before September 15, those that molt before October 15 and those that molt before November 15. The latest molters are banded as the choicest layers and are used in the cockerel breeding pens. The others are second and third class, according to time of molting.

Such a rule may seem arbitrary to some and likely to cut out some deserving hen, but the fact is that many hens do pass the test and lay for a year or more before they molt. If these hens are carefully selected and used as breeders to the exclusion of other birds just as good looking and typey, improvement of the flock is inevitable. Two years ago the necessity of breeding up was urged because of the high price of feed. Feed has gone down but the low price of eggs still demands improvement. If eggs are cheap we must increase profits by cutting expense and that means making one hen do the work of a hen and a half. When feed bills are less smaller egg checks will not be so serious a matter.

Color Test

The color test is really only a molting test. Heavy production tends to fade the color from shanks, vent, beak and earlobes, and when the production stops the color returns. A hen that in June shows bright yellow shanks and beak has not been laying heavily. She may have already begun to molt, and she may have done so little laying that the color has never faded. Whatever the reason, she may safely be eliminated.

Beginning with June, the color test may be used for culling out unprofitable birds, and in September, October and November it may be used for classifying the layers. In October the hen with the bright yellow shanks and beak and glossy feathers is the one that has already finished molting, and the ragged, faded bird is the long distance layer. Hens may be classified as good, better, best, according as they show much or little yellow color, but the bright colored birds are the early molters and the faded ones the late molters, so it narrows down to a molting test after all.

FIFTY POULTRY FARMS FOR EX-SERVICE MEN

Plans to subdivide a limited area of land at Delhi into 50 five acre poultry farms providing homes for 40 ex-service men besides ten experienced poultry raisers were announced recently by the state land settlement board at the University of California College of Agriculture. These plans are announced by Professor Elwood Mead, chairman of the state board. Professor P. I. Dougherty of the poultry division has inspected the land and has reported favorably upon it. The area under consideration is located on First Avenue, one mile east of the board's office at Delhi.

That the presence of 25,000 or 30,000 hens would be enough to justify the establishment of a cold storage plant is the belief of Professor Dougherty, it is stated. Such a plant could be established in connection with the arrangements for the cooperative marketing of other products.

Professor Mead today invited experienced poultry raisers desiring to participate in this development to confer with him at his offices in 100 Agriculture Hall, University of California.

Poultry Queries

Conducted by Jean A. Koethen

Broken Rice

I would like to know the value of broken rice for chickens. Should it be fed dry or cooked?—Subscriber, Simi.

Broken rice may be used up to 1/3 of the scratch feed if it is cheaper than other grains, but it is not as good for the growing chick as corn or wheat, and its use should be limited. According to Professor Jaffa, its nutritive ratio is from 1:12 to 1:14; that is, it is very fattening indeed, and not so well adapted to the building of bone and muscle and deep tissues as wheat bran, which has a nutritive ratio of about 1:4. It may be mixed dry in the scratch or cooked quite dry and fed as a sort of wet mash once a day.

To Postpone Laying

How can I keep my White Leghorn pullets, hatched in February, from laying before September? At present I am feeding a mixture of milo, wheat and growing scratch night and morning, and a growing mash with about 1/3 bran added, which is before them all the time, also plenty of chopped green alfalfa.—Subscriber, Del Rosa.

At the university farm pullets are held back from laying too early by replacing the laying mash, when they are 3½ to 4 months old, with a mixture of 95 per cent bran and 5 per cent bone meal. Along with this, they should have all the greens they will eat, and as much range as can be given. They are kept on this maintenance mash till it is time for them to begin to lay, which is about the age of six months and then are given a regular laying mash. The scratch used with the maintenance mash should contain considerable cracked corn, so that the birds may have a little surplus fat on their bodies when production commences.

Good Egg Record

Between January 1 and May 10 my 16 Barred Rock hens laid 1,180 eggs. Is this a real egg record? They run at large, and till the last four weeks have picked their own living from a

barley straw stack and corn ensilage —Mrs. C. E. H., Riverside.

That is an average of 56¼ per cent, which is very good, especially considering that they have not had a regular egg ration. Had they had a laying mash and some wheat at night in addition to their corn and barley, they might have reached an average of 180 or over. Doubtless the exercise they got scratching for their living was largely responsible for their excellent production.

Blood Streaks

Can you tell me why many of my eggs are streaked with blood?—Subscriber, San Diego.

These blood streaks come from slight hemorrhages in ovary or oviduct, and are believed to be due to forcing. Leghorn pullets that are fed a heavy laying ration or a ration containing stimulants which push production beyond the normal are quite likely to show such streaks in their eggs. The cause, of course, suggests the remedy. Add bran to the mash, cut out condiments, feed more greens, and give the pullet a chance to slow down in production and build up her constitution.

Roupy Turkeys

My turkeys are dying. On examination I find that nearly all have canker in the throat and under the tongue. There is coughing and rattling in the throat, and when they are held head down mucous runs out of the windpipe. I find the lining of the crop also partly covered with this yellow cheesy substance, and there is stringy greenish diarrhoea. Some live a week and some die suddenly on the nest. I have given permanganate of potash and used it in the drinking water.—A. J. B.

Your turkeys have diphtheretic roup. They should be separated at once from the rest of the flock and put so far away that contagion cannot be carried. Wash your hands with an antiseptic after treating them, and do not carry vessels from their yard to the flock. You will have to swab out their mouths and throats with peroxide of hydrogen or a 50 per cent solution of hydrochloric acid, and then spray with the following solution: Extract of witch hazel, 4 tablespoons; liquid carbolic acid, 3 drops; water, 2 tablespoons. Use the spray twice a day after the throat has been cleaned out. Permanganate of potassium is useless except as a head dip. Dipping the head in a solution and holding it there a few seconds is often effective when only the nostril is to be reached, but does not reach the throat and windpipe.

Swollen Abdomen

Two of my R. I. Red hens three years old had such a swelling of the abdomen that I was obliged to kill them. The skin turned dark and feverish; droppings thin and white. They moped several days and would not eat. The ration consists of scratch feed, rolled barley and bran, lettuce and table scraps. They have been laying well.—A. W. M., Los Angeles.

As those hens were old, I suspect they were so fat they could not readily lay the eggs they manufactured. Perhaps a broken egg clogged the oviduct or there was a rupture, and blood poisoning followed. There was probably nothing you could have done for them.

Depluming Scabies

Some of my hens become bare of feathers in spots, and others are almost naked. I have looked for some sort of mite but can find nothing. Please tell me what to look for and a remedy.—Subscriber.

You cannot see the mite that is working there without the aid of a microscope. Some of the feathers have very likely been pulled out by the hens themselves, and there is no stump, but if you look closely around the stumps that do show near the bare spots you will find masses of tiny epidermal scales. Under the microscope these are found to be full of mites. The remedy is to rub into the skin every four or five days one of the following: Balsam of Peru, diluted 1 to 3 with alcohol; oil of caraway ointment (1 to 5); sulphur, 1 dram, carbonate of potash, 20 gr., lard or vaseline, ½ ounce, mixed into an ointment. Be sure you treat every affected bird.

Onions: Supplies heavy, market weak. Stocktons: White Globes and Browns, cold storage stock best 1.00, poorer 60@ mostly 12½. Coachella and Imperial Valleys standard crates Wax 1.15@1.25.

VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock May 24, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Artichokes: Supplies heavy, market steady, 75@1.00; few fancy, 1.25 doz.

Asparagus: Market steady; supplies liberal. Local: Mostly 13@16 per lb. Northern, 10@13 per lb.; poorer, 7@9.

Beans: Supplies liberal. Per lb., Green Kentucky Wonders, 14@17 per lb., green pods, 12@14 per lb.; Wax, 11@13 per lb.

Beets: Doz., 30@40.

Cabbage: Field crate best mostly 3.25 @3.50; poorer, 2.25@2.35.

Carrots: Doz., 35@40.

Celery: Supplies light, market firm, best per cr., 11.00.

Corn: Supplies moderate, market steady, best 60@75 per doz.

Cucumbers: Local best, 1.75@2.00 doz.; Hothouse, mostly 1.50@1.75.

Eggplant: Supplies moderate. Imperial, mostly 17@20 per lb. Mexicans, mostly 12@15 per lb.

Lettuce: Local field crate quality poor, 75@90; best, 1.00@1.25.

Peppers: Supplies liberal, market

Peas: Local, best 12@15; poorer low as 10 per lb.

steady. Imperial Valley, Bells and Chilis, best, 25@30 per lb.; Mexicans, Bells and Chilis best, 22@25 per lb.

Radishes: 20@25 doz.

Rhubarb: Local strawberry 1.10@1.25 bx.; jobbing 1.00@1.15; Crimson Winter, 60@80.

Spinach: Mostly 25@30 doz.

Squash: Summer, best, 80@1.00; jobbing, 70@90; Italian, 75@1.00 per flat.

Tomatoes: Supplies liberal, market weaker. Imperial Valley, per crate, best 1.90@2.15; poorer 1.60@1.75; jobbing, 1.75 @2.00.

Turnips: Do, 45@50.

FRESH FRUITS

Cherries: Supplies moderate, Black Tartarians mostly 18@20; poorer 14@16.

Apricots: Supplies light, market steady, mostly 2.50@3.00 per 20 lb. bx.

Blackberries: Supplies moderate, market steady. Best 5.00@5.50; few low as 4.50.

Loquats: Best mostly 7@9.

Strawberries: Supplies moderate, market weaker. Per crate, 30 pints, best 4.75@5.25; poorer 3.00@4.00; fy., 5.75.

Raspberries: Supplies moderate; best, 4.50@5.00; poorer, 3.75@4.25 per 30 pint crate.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm on good stock. Local: per box, market pack 2.00@2.50, special packed brands 3.00@3.25.

Lemons: Supplies heavy, market dull, wide range in prices. Local: packed box 1.50@2.25, few high as 2.75, loose 75@1.00 per box, per lug mostly 40@50.

Oranges: Supplies firm, market firm. Navels, market pack, large sizes 3.00@3.50, small low as 1.75, special brands, large sizes 4.00@4.75, small sizes 3.00@3.50. Valencias, best brands, all sizes 3.75@4.00, packing house culls 50@75, few best 1.00@1.75 per box.

HONEY

As reported by the Bureau of Markets: Southern California, Los Angeles: Supplies of White honey light, of Light Amber grades heavy. Movement slow, market dull. Carloads f. o. b. usual terms, per lb. White Orange Blossom 10@12; White Sage 10½@12½; White Alfalfa 7½ @8½; Light Amber Sage, 8@9; Light Amber Alfalfa 6½@8. Hawaiian, White 7; Honey Dew honey 4½. Recent hot winds have badly hurt Orange and Sage honey prospects and with southern Sage already seriously damaged by cold and dry weather, a very light crop of the lighter colored honeys is forecasted. The Alfalfa crop is probably normal. High retail prices are still maintained throughout California, and hurt honey distribution locally. Some large shippers expect a firm market, account light crop this year; other factors are still pessimistic. New honey will move in light quantities this month and next, but shipments in large quantities are not expected before July. Beeswax: Sacked in l. c. l., Light 25@30; Dark, low as 23 per lb.

GRAIN AND FEEDS

Grain Exch. price bid May 24:
Corn: Bulk, No. 2, Yellow 1.65.
Bran: Kansas, 31.50@32.00.
Kaffir: Eastern, No. 2, 1.75@1.80; No. 3, 1.66¼@1.75.
Milo: No. 2 Eastern bulk, 1.93¾@2.00.
Barley: Carlots 1.31¼@1.32½.
Barley: Carlots 1.37½.
Wheat: Mixed feed 37.00@50.00.

HAY

Alfalfa Growers of California report under date of May 23:

Continued light receipts of alfalfa hay, continued with a good demand and absence of selling pressure, gave the market and upward tendency throughout the week and led to an increased business in round lots for prompt and nearby shipment.

The movement of alfalfa hay is still very light for this time of the year; prices remain firm and demand good. The production so far this season is materially smaller than last year up to this time. This is partly caused by the light yield of the first cutting in most sections of the state and partly by the lateness of the season, on account of unfavorable weather conditions, as a result of which in most parts of the state they are almost a full cutting behind last year.

Reports from reliable sources show considerable damage to hay down as a result of the prevailing weather. Weather bureaus report rain very general throughout the state. There were 540 tons received in Los Angeles, week ending May 21.

There were 320 tons received on the Los Angeles tracks the week ending May 14 with 40 tons held over as against 320 tons the week before.

Rabbit Alfalfa	27.00
No. 1 Dairy	23.00
Standard	20.00
Stock	15.00

About 50 per cent of the grain hay south of Tehachapi was cut before the rain. This will be nearly a total loss.

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	20.00@28.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	20.00
Standard	16.00
Straw	10.00@13.00

LIVESTOCK

Western Meat Company prices are:

HAY AND FEED

Alfalfa Growers of California report under date of May 23:

No. 1 Dairy	17.00
Standard Dairy	15.00

Under date of May 21, A. W. Scott Co. says:

receipts of hay for the past week were 937 tons as compared with last week's arrivals of 839 tons. As yet only a little new volunteer and some new first cutting alfalfa have appeared on the market and have been slow to sell at our quotations below. No new grain hay has yet been reported sold either on our local market or in the country.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	18.00@20.00
Wheat Hay, light 5-wire bales	15.00@18.00
Tame Oat Hay	15.00@17.00
Wild Oat Hay, old crop	11.00@13.00
Wild Oat Hay, new crop	10.00@12.00
Barley Hay	11.00@13.00
Alfalfa Hay	14.00@16.00
Alfalfa Hay, new first cutting	10.00@12.00
Stock Hay	10.00@12.00
Barley, Ground	31.00@34.00
Barley, Rolled	28.00@30.00

CONCRETE PIPE TESTS

Concrete pipe is a necessity to California, that is, good concrete pipe. So much poor stuff has been made, however, that Farm Adviser Hodgson has lately considered it necessary to hold eight pipe testing demonstrations in various parts of Los Angeles County to show the chief points necessary to consider when making or purchasing concrete pipe.

To make these meetings of greatest value Mr. Hodgson secured the services of Fred F. Foster, field manager of the Associated Pipe Manufacturers of Southern California. So great a range of pipe was shown in commercial material submitted that one piece broke at four pounds pressure while another held up to 80 pounds pressure, though in ordinary field work pressure is seldom more than 20 pounds. Some poor pipe showed seepage of water at but two pounds pressure. Good pipe should become better with age, but poor pipe rapidly deteriorates.

Cement of the best only should be used, sand must be clean, and either crushed rock or clean gravel used, resulting, with the addition of a little rock dust, in a concrete pipe of great density and proof against age. The mixing should be uniform, and this means thoroughness with a good machine, after which proper curing will bring a top-notch pipe; a curing of not less than ten days. If concrete pipe is manufactured according to recognized standards and specifications it should improve with use and age. These necessary standards have been recommended by the Los Angeles section of the American Society of Civil Engineers and adopted by the Southern California Associated Concrete Pipe Manufacturers, and all purchasers of pipe should insist that it conform to these standards. The cost of standardized pipe is proportionately no greater than that of inferior grades.

Enter Alkali

The United States government is authority for the statement that where excessive amounts of alkali is present in the surrounding soil, some other material than concrete is necessary. Right here is where clay pipe comes to the rescue, for clay resists the action of alkali if well burned, even though the burned clay is not impervious to water.

In 1917 the federal government issued a bulletin dealing with the subject, entitled Technologic Paper No. 95. In the May number of "Reclamation Service," E. C. Bebb, United States reclamation engineer, in reporting on a continuance of the experiments, says: "Summing up, our experiments seem to indicate that surface disintegration of the poorer grades of concrete begins with concentrations of about two-tenths of one per cent (in waters of the sulphate type) and that severity of the action increases until with concentrations of two to three per cent even the best concrete disintegrates rapidly. * * * Alkali salts are not uniformly distributed throughout the soil or through seepage waters and it will be difficult to determine in advance the concentrations to which a structure may later be exposed. As was to be expected durability appears to be dependent upon impermeability, which in turn is mainly dependent upon richness of mix and gradation of aggregates. * * * Salt in solution is the primary cause of the trouble."

SAN FERNANDO FAIR

San Fernando Valley proposes to hold a real fair. It will be one of the earliest fairs in the state, following immediately after the state fair at Sacramento. The dates chosen are September 13-18. One of the outstanding features will be a practical working tractor demonstration. A still exhibit will be made on the fair grounds while nearby the Lopez ranch 700 acres of fine sandy loam has been secured as demonstration field. A great number of tents are to be erected, in fact, there will be under canvas 125,000 square feet of exhibit space. The biggest tent of all will be devoted to tractors. Others will be occupied by trucks, trailers, pumps and irrigation, motor cars, power farming generally, machinery and implements, horticulture, agriculture, home economics, poultry, livestock. The fair will be under the direction of the San Fernando Valley Fair and Market, Inc., of which Dr. W. H. Gundrum of Owensmouth is president and M. G. Dial of San Fernando is chairman of the fair committee. E. R. Elkins is director of fair. R. M. O'Neil will be director of tractors, trucks, power farming, machinery and implements. The poultry department will be under the management of E. I. Hammond of Riverside. The premium list will aggregate about $5,000.

DOWELL ROADS BILL

At the April meeting of the American Farm Bureau Federation in Washington the following resolution was passed:

"We earnestly approve the local building of farm-to-market highways by the use of federal and state and local funds. Until such roads are built we emphatically oppose the construction by the federal government of a few hard surface transcontinental roads. Regardless of the character of the roads which are built, an adequate amount of such funds should be provided for their maintenance and repair. We urge the administration of federal road funds be in the hands of the United States department of agriculture."

Congressman C. C. Dowell of Iowa has introduced a bill, H. R. 5693, which meets much more closely the American Farm Bureau Federation's demands for farm-to-market roads than the bill introduced some time ago by Senator Charles E. Townsend, chairman of the committee on post roads. The Dowell bill continues the supervision of the federal funds in the bureau of roads in the department of agriculture. It requires each state receiving federal aid to designate through its highway department a connected system of roads interstate in character not exceeding seven per cent of the total road mileage in the state and to classify the system in two groups—primary or interstate, and secondary or intercountry. The state highway department is required to submit to the secretary of agriculture project statements setting forth proposed construction of any rural post or other roads, and to furnish to him any surveys, plans, specifications and assistance that he may require. The secretary is prohibited from providing any funds until the state has adequate money for the maintenance of federal aid roads and by law shall have placed maintenance work under the direct control of the state highway department. The federal money is to be matched with state funds. At least 60 per cent of the federal aid will be expended on the primary or interstate roads of state systems until completed. Exacting requirements are provided for the maintenance of all federal aid roads. The Dowell bill permits the secretary of agriculture and the states to determine the width of roads according to local conditions or requirements.

ALMOST TWINS

The prevailing belief that a double yolked egg cannot hatch is almost disproven by an experience of Mrs. C. E. Hibbard of Riverside, who writes:

"On Sunday, May 8, one of our hens came off with 12 chicks. Thinking the hatch was over, as no more eggs were pipped, we let her off to eat. Returning to the nest some 20 minutes later, we found another egg containing a dead chick. This chick had two bodies, two sets of wings, four legs and feet, but only one head. The two bodies were joined from neck to tail. They were covered with down, and we have every reason to believe they would have hatched if the egg had not been broken. We have put this curious chick in alcohol and intend to keep it."

WEATHER REPORT

San Francisco, Cal., May 21, 1921.

Comparison of Various Methods of FUMIGATION

Last Season Shows Favorably for Liquid Hydrocyanic Acid

Convenience, Economy and Efficiency

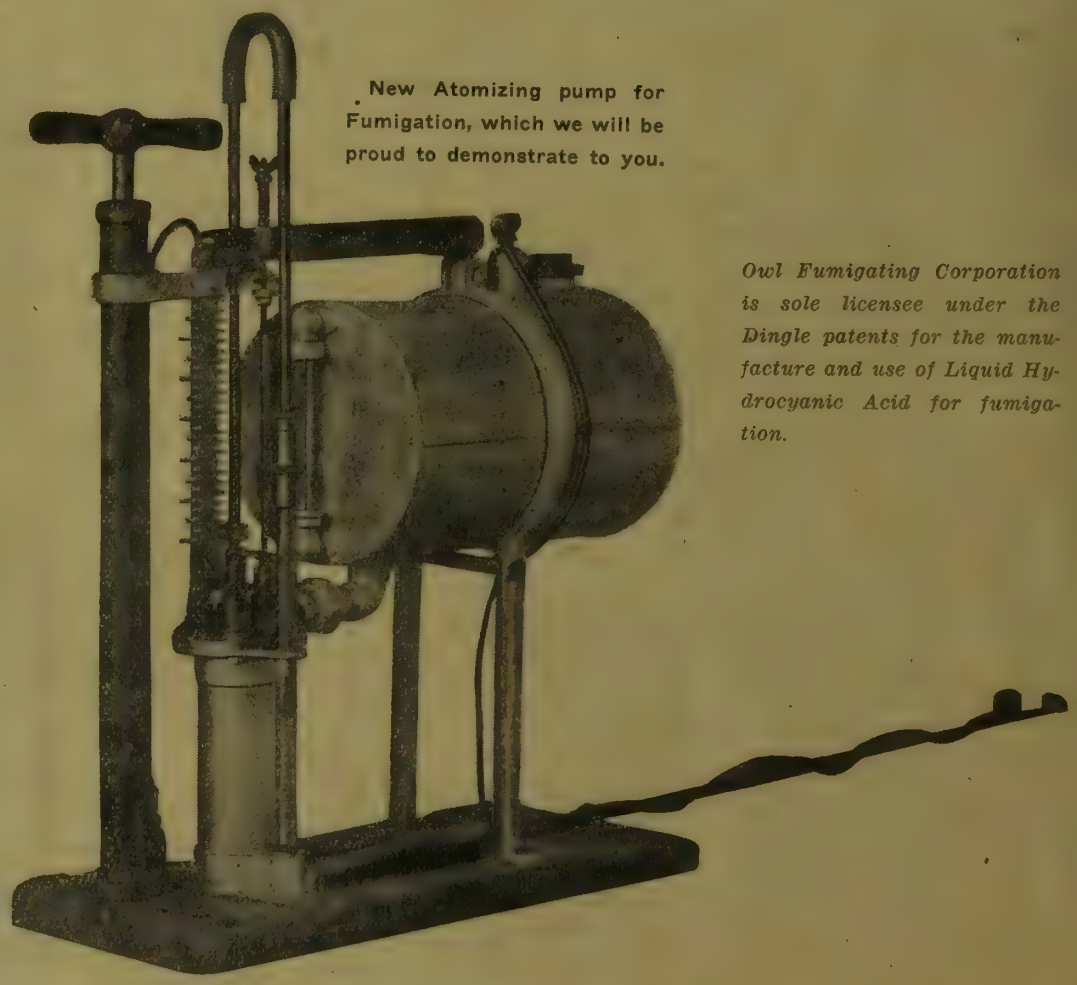
Require Its Use

We have developed a type of atomizing pump

Entirely Different in Principle

The unsatisfactory features of **ALL** previous devices have been eliminated.

Accurate dosage quickly measured, and delivered as a mist, so extremely fine, that it quickly vaporizes, together with substantial yet simple design, mark this Pump as the superior of any yet offered.



New Atomizing pump for Fumigation, which we will be proud to demonstrate to you.

Owl Fumigating Corporation is sole licensee under the Dingle patents for the manufacture and use of Liquid Hydrocyanic Acid for fumigation.

The accuracy, efficiency and success of this pump have been proven by actual operation.

Aero Brand Hydrocyanic Acid with this **pump** and our **service** will be extremely valuable to you this season.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

That is not a photograph of a load of hay on the cover. In fact, it is altogether too large and, we might add, too valuable for a load of hay. Its appearance was that of a great stack of gold rather than roses. It is said that Portland and other sections of the Northwest are so congenial to roses that there they are at their very best, but no rose producing section in the world ever gave a more striking vision than did the original of this photograph. It will be another year before this scene will be repeated, but if one will remember about the first of next May and drive to San Dimas in eastern Los Angeles County he will doubtless see a repetition of this wonderful picture in the rose bush growing over a large lathhouse of Mr. Teague's nursery.

* * *

The king of England has his first box of California Navels which was shipped all the way by water. Hence "the Master of the Household presents his compliments to the donor and is commanded to thank him very much for the boxes of oranges and lemons from the California Fruit Growers Exchange of Los Angeles which have safely arrived and been offered for the King's acceptance. The gift is very much appreciated." By the way, the All-Western Committee on Transportation is meeting in Seattle this week. The shipment of Northwestern apples and of California citrus fruits has proven so successful that it is determined that more complete refrigeration equipment may be installed which will permit inter-coastal ocean shipments of all kinds of perishable farm products. The present movement is being encouraged particularly by the citrus growers, who state: "Excessive railroad freight rates forced growers to look into the possibilities of water transportation. This method through various tests has proved entirely practicable as well as economical. The enthusiastic support of apple growers in the North and their pledge to cooperate with us in guaranteeing a tonnage which will interest steamship companies to establish adequate facilities for carrying our commodities, is gratifying and proves that water shipping may be made permanent and that a good percentage of Western perishable crops in the future may move to Eastern markets by all-water routes."

* * *

Speaking of freight rates: It is reported that hundreds of producers of annual crops are refraining from growing more than will be necessary to maintain their existence. The recent reduction of 20 per cent on a few of the products of the coast helps a little, but it must be remembered that the freight rate is still vastly higher than prior to the war. And it probably is remembered that most of the prices being reecived by the farmer after delivery to the Eastern market are vastly inferior to those prior to the war. There is little response by the farmer when urged to produce more under such conditions.

* * *

Now comes cooperation and rural credit. "The purpose of the rural credit society is to standardize paper for agricultural production in the open market and thus give the farmer access to the financial and industrial centers for the sale of such paper, whereas he is today restricted to the local deposit banks. This would not only materially reduce the interest rate which the farmer would have to pay, but it would provide the machinery for the capitalization of the actual tiller of the soil who possesses honesty, energy, frugality and farming experience."

All the 1921 plum crop of Tulare County has been bought by one firm and will be packed at Exeter.

KEEP IT WHERE IT BELONGS

"The sales tax will affect the farmer very disastrously because first he would have to pay the income tax, and on top of this he would have to pay the sales tax, because he would not be able to pass it on as the price of his merchandise is fixed beyond his control. In addition to these two taxes he would have to absorb as a consumption tax all that the trusts and closely controlled corporations are able to hand back to him, so that the farmer would be practically left with three taxes; an income tax, a sales tax, and the consumption tax on the articles he buys, such as agricultural machinery, fertilizers, etc., which are closely controlled and the price of which can be fixed by the manufacturer.

"Those who advocate the repeal of the excess profits claim that it is taking capital from corporations that is needed in the business and that business is being thereby strangled. This claim will not bear close investigation. If it were true, the first sign of it would be that the people had refused to put their money into corporations. Figures show for the last three years that the amount of money put into corporations with a capital of over $100,000 was in 1918, $3,000,000,000; 1919, $12,000,000,000; 1920, $13,000,000,000.—H. C. McKenzie of the Federal Farm Bureau.

E. L. PAYNE

Those who were subscribers of the California Cultivator a decade ago will recall that the legal department and the answers to legal questions were in the hands of Edward L. Payne, and possibly some were aware that he gave up active work in the Cultivator and relinquished his practice at law in order to engage in farming in the Antelope Valley. The recovery of his health was the principal reason for his seeking the outdoor life. He made farming a success, as he did his law practice, but was compelled also to relinquish farming, and a few weeks ago was commanded to cease from his earthly labors.

JIMMIE DE CAMP

Those who have read articles in the columns of the Cultivator which touched upon "Driver Trouble" and other problems of interest to operators of automobile and tractor may recall several appearing within the past two years by James De Camp. A practical driver himself and with fine faculty for conveying to others ideas which he secured by practical everyday work, he wrote some exceptionally fine articles on farm power. It is with greatest regret that we are compelled to announce that he will write no more. He died last week at his home in Highland Park, Los Angeles. Although only 23 years of age Mr. De Camp had been on the staffs of the Los Angeles Times and California Cultivator for several years. With all his ability as a writer he was a remarkably fine character and one who did all in his power to add his share to the world's happiness.

H. O. GARDNER

One of the first to see the value of the federal farm loan and to encourage the organization of local loan associations was H. O. Gardner of Los Angeles. He was active in the formation of several different associations and became secretary of several of them. The largest of these was the Southern California association, which had members in several counties. Loan association work has been so nearly dormant during the past year that Mr. Gardner's work until recently has been very limited, but since the favorable decision of the supreme court has been planning extension of his activities and the making through the associations of many new loans. His work is now ended by his death which occurred last week, but the farm loan activities will be continued by his son, who has been associated with him. Mr. Gardner died in the harness for he continued work at his desk until long after he should have been under the care of a physician.

PAYS THE FREIGHT

A representative of the transportation department of the American Farm Bureau Federation appeared at the interstate commerce commission's hearing in Denver on May 19 and presented the following statement:

"The prices of farm products are set by competitive conditions. The price of farm products is fixed at the market and not at the farm itself. The farmer receives the market price less the freight. The manufacturer adds the freight to his cost of production. It is because the farmer must so pay the freight in every case that the increase in freight rates affected the agricultural interests of the nation so seriously. When you add to this increase in the marketing costs the unprecedented fall in prices of farm products it becomes evident that the farmer has reached the crisis and must be able to put his hay, grain, livestock, fruits and vegetables on the market at a less cost if he is to avoid bankruptcy.

MORE POWER

It is anticipated that it will be but a short time until California's population will be increased by another million, and John Willis Baer's estimate is that for every million increase in population there will be needed 700 million of new money to be invested in public utilities. In fact, it will require more than the 700 million, for it seems that that percentage was based on the needs of the entire country, whereas California's magnificent distances and engineering problems of mountain and valley make more costly investment necessary. To quote Mr. Baer:

"In other words, we must face the fact that California will require a great deal more money than the average state in the Union because of her rapid increase in inhabitants, her size and her scattered population, and it is important that not only banks and financial houses of California, but the public generally, recognize the fact that if California is to keep up her present growth her people must themselves be prepared to provide the utility companies with the monies necessary to furnish the economic necessities for this growth, especially in regard to the development of our hydro-electric power. The California situation is such that these investments are perfectly safe, due to the control by the railroad commission of our hydro-electric utilities."

The need for funds for financing these public utilities, especially the conservation of floods and making possible their use through all the year to develop water for pumping and other farm activities was never so great as now and its cost perhaps never so high, and other needs for Eastern and foreign capital are such that California is called upon to finance her own. Hence our farmers are appealed to for aid in financing that which will add to their own prosperity.

But in this connection we are reminded by an item in a central California paper that entire justice is not always given to irrigators and users of power on the farm in the matter of rates. This item referred to the fact that some farmers were being compelled to cancel contracts for electric power because of the new rates approved by the state railroad commission being so high that alfalfa production at least becomes impossible. One farmer reported his alfalfa was costing him exactly $5 per ton water pumping bill. Alfalfa production at any such cost at present day prices is a physical impossibility. Every step possible should be taken to increase hydro-electric power, but unless its cost can be reduced it is hardly worth while to capitalize.

California Cultivator

Vol. LVI, No. 23 | Los Angeles, June 4, 1921 | One Dollar Yearly

"Save the West"

By Walton T. Farrar

WITH the industrial horizon of the Pacific Coast clouded by the paramount issue of excessive and prohibitive railway freight rates, producers of high tonnage per acre commodities have started concerted action in order to save their crops from impending annihilation.

Such an alarming condition has arisen that growers of the Pacific Coast have commenced a campaign to "Save the West." A fight is being waged against legislation which tends to throttle the heavy shipping interests.

The first point of attack in the "Save the West" battle is the transportation act of 1920. This act is declared by C. C. Teague, president of the California Fruit Growers Exchange, to be the most vicious piece of legislation ever enacted.

An annual net income of 6 per cent upon all railway property is guaranteed by this act. Teague charges that the 33 1/3 per cent increase established by the interstate commerce commission in 1920 is traceable directly to this clause.

He claims that it pools a group of worthless railroads of the country with the better roads and allows them to exist through taxation of the heavy tonnage producing interests. Many of these roads are small lines with no tributaries of high tonnage producing territory and have no reason for existing.

The fruit growers of the Pacific Coast, including the states of Washington, Oregon and California, during the coming season will have a total of more than 100,000 cars of fruit, the largest part of which will be distributed in the eastern coastal zone of the United States. With this factor in view, the fruit growers, who have capital invested exceeding $300,000,000, propose to form a central organization which, acting in close cooperation with similar organizations in other sections of the country, together with commercial organizations of many municipalities, will present a powerful and united front in the fight for just and reasonable rail rates.

That not more than 50 per cent of the vegetable acreage of the state is planted to crops this season and that this deplorable condition may be traced directly to the present excessive freight rates is the statement of Thomas O'Neill, president of the California Vegetable Union.

The entire vegetable crop of California was sold last fall at a price below the cost of production. The reason any was shipped was because the crops had been matured and the growers thought it better to sell at a price below cost of production rather than at a total loss. The same condition applies to all vegetable producers.

A report just issued by a representative committee of the principal food producing and shipping interests of the state shows how the present freight rates adversely affect the prosperity of the west's great industries.

A complete survey of the field was made before the committee reached the conclusion that the increase in freight rates as allowed under the transportation act of 1920 has practically placed a mortgage upon the entire acreage of the growers, in most instances taking more than the average return of profit from the industries.

The added tax on each acre of the twelve principal food products of California is shown in the following table compiled by the committees:

	Added tax per acre
Lemons	$187.67
Oranges	192.38
Rice	19.49
Beans	10.65
Raisins	17.87
Grapes	162.51
Olives	28.60
Walnuts and Almonds	15.08
Prunes (dried)	35.75
Apricots (dried)	17.88
Peaches (dried)	21.44
Apples (fresh)	160.87

The only remedy for this deplorable condition, in the opinion of the committee, is the repeal of the transportation act of 1920.

That the entire commercial fabric of the Pacific Coast will be undermined if the present excessive freight rates are not reduced, is the assertion of G. Harold Powell, chairman of the producers transportation committee, appointed by State Market Director Daniels at the request of Governor Stephens.

"This is the most serious situation that has ever confronted the west," he says. "It not only threatens the citrus and vegetable industries with complete ruin, but affects every other industry in the state."

The members of the committee which compiled the facts and is preparing the data for the fight to be made before the interstate commerce commission are: G. Harold Powell; C. C. Teague, president of the California Fruit Growers Exchange and the California Walnut Growers Association; J. F. Niswander, president California Peach and Fig Growers, Inc.; Herbert Hazeltine, president of the American Fruit Growers; Thomas O'Neill, president of the California Vegetable Union, and J. L. Nagle of the California Fruit Exchange.

A Fig Growers School

By E. M. Boland, California Peach and Fig Growers

WHAT is believed to be one of the most forward looking steps taken in behalf of members of a marketing association was successfully launched last month by the California Peach and Fig Growers of Fresno when the traveling school for fig growers was held.

That it is destined to grow to be one of the most valuable activities of the association is the prediction of horticultural experts who followed the progress of the venture with considerable interest. If, for no other reason, they state, it will prove a valuable medium for the exchange of ideas, the lack of which has handicapped the farmer for years. It is pointed out that it is only in recent years that the growers of the country have had a medium for exchanging ideas outside of their immediate neighborhood.

The traveling school idea originated with Ira J. Condit, former professor of horticulture at the University of California, and now at the head of the horticultural department of the California Peach and Fig Growers. The system of intensive study of growing problems has long been a part of the courses given at the agricultural colleges of the country and the practice has been adapted for the use of association members growing figs.

In preparing to establish the school Professor Condit reviewed a number of inquiries received from growers in the San Joaquin Valley and selected what were considered the most important in growing a fig of high quality. Particular localities where these problems were more frequently met and other localities where they had been successfully solved were placed on the itinerary and arrangements were completed for a week in the field which would include a visit to the localities and orchards selected and discussions and demonstrations staged by practical growers which would effectually answer whatever questions had come up during the year. It was also possible through this method to get the ideas of a number of successful growers and to expound various theories as well as search for new developments.

That the fig industry is in its infancy as far as general knowledge of methods that should be pursued to bring the California fig to its highest standard was established. There are in the state a great number of orchards whose output ranks in quality with the very best fruit grown in Asia Minor. This has been established by experiments of the department of agriculture through shipments to Smyrna where the California product was pronounced to be figs grown in the Meander Valley where the best Asiatic figs are grown.

The methods employed in these orchards however were little known outside of that particular district, but through the medium established by the traveling school growers from other parts of California were enabled to acquaint themselves with these practices.

For the purpose of districting the sections covered and stressing certain conditions to be found in the various districts, the territory covered was divided into the Modesto, Merced, Madera, Fresno and Clovis, Reedley, Dinuba and Tulare districts.

Members of the association were invited to join the school at whatsoever point was convenient, an advantage which proved valuable to many busy growers who were able to accompany the school for a few days only. A number, however, made the entire trip and it is estimated that during the week over 300 growers participated.

Through the medium of the widespread exchange of ideas it is believed that fig culture in California will be raised to the highest standard ever attained. Already the quality of the California fig is high and it is through quality that the association hopes to bring about a tremendous increase in consumption in this country. The spirit of cooperation will be in vogue from orchard to consumer and promotion work to popularize the fig will be increased in proportion to the increase of production.

In a report covering the first traveling school Professor Condit makes the following summarized observations that will be acted upon by the association in planning future schools:

There is a need for more definite information regarding methods of culture, caprification and harvesting figs.

There is need for more careful study of soil and soil moisture condition in order to produce maximum crops of optimum quality.

There is need for summer pruning of young vigorous Calimyrna trees in order to induce branching, it having been found practicable and with promise of good results.

That top-working of fig trees can be done successfully if proper methods and care are used but that failures are common if the work is done carelessly or improperly.

That pinching back the new growth of capri trees in May forces out mamme figs in June when they are readily caprified.

That frost damage to fig trees is more severe than at first thought, some crops being entirely ruined and young trees being severely injured.

That sour sap does occasionally affect frosted fig trees following spring frost.

No question that has a bearing on the industry will be neglected, in planning future classes, according to Professor Condit.

It is believed by officials of the association that through the interest that was created in the state in fig culture the yield of the highest grade fruit will be materially increased this season. Figs of the first grade handled by the association will be put out this fall under the "Blue Ribbon" brand.

By gradually improving orchard conditions it is hoped to materially increase the tonnage for the "Blue Ribbon" brand and thus eventually establish it as the standard quality in the markets of the country.

Agricultural News Notes of the Pacific Coast

Northern California

The Shasta County strawberry crop is estimated at 8,000 crates.

Stockton reports benefit from the May rains except on hay and cherries.

On May 14, there were 2,500 lambs shipped from Rocklin, Placer County

Sonoma hop growers are depressed over the low price of hops, now but 20 cents a pound.

The 1921 bean acreage in Sacramento County will be more than 10,000, perhaps 12,000.

Nine farm centers in Yuba County have combined to help boost a county fair at Browns Valley.

Sacramento reports May rains a heavy injury to hay but damage to the cherry crop very light.

Northern counties sheep men have commenced their annual drive of sheep to mountain grazing grounds.

Northern counties are preparing to celebrate "Rice Day," so designated for June 11 by Governor Stephens.

A Sutter Basin company will plant 700 acres of milo, following the barley crop; the land is now being plowed.

El Dorado County is reported by the farm adviser to be growing a larger acreage of potatoes than for several years past.

Yolo Maize, a new variety of milo, is being introduced by the state farm at Davis to farmers of the Sacramento Valley.

A Jersey cow belonging to the Beckley Dairy Farm at Grimes, Colusa County, gave birth to two fine calves, but at three weeks apart.

Thirteen pure bred Corriedale sheep arrived in San Francisco from New Zealand, May 20, as first class passengers on the liner Marmara.

The Petaluma branch of the American Poultry Association announces the next annual convention to be held in Washington, August 8-13.

A Berkeley man has invented a method of replacing air in a fruit car with carbonic acid gas, and two cars shipped to New York were in better state than fruit in iced cars.

Growers of livestock are forming an association which expects to hold its first convention in San Francisco in September, under the direction of the state agricultural department.

The big fruit packing plant at Emoryville, Alameda County, was last week sold by the Western Canning Company to the Virden Packing Company. It employs 1,500 hands.

Farm bureau meeting in Tehama County centers are: Westside, Monday, June 6; Orland, 8; Jacinto, 10; board of directors, Saturday, 11; Codora, 13; Capay, 15; Plaza, 17; Grapevine, 22; Larkin, 24.

The California Development Association, the California Industries Association, and representatives of various chambers of commerce met in Sacramento May 21, to devise ways of bringing city and rural interests closer together.

Meetings of Tehama County farm bureau centers: Squaw Hill, June 6; Dairyville, 8; Antelope, 9; Oak Park, 10; Corning, 16; Bend, 17; Liberal, 23; Bowman, 25; Los Molinos, 27; directors meeting at office in Red Bluff, June 25 at 10:30.

Central California

Tulare County now has 60,000 acres of bearing orange trees.

Stanislaus County's first ripe peaches were shipped from Ceres, May 25.

The Stanislaus County Veterinarians Association was organized at Modesto, May 25.

A new milk condensary is nearing completion at Oakdale, Stanislaus County.

Kings County farm bureau has fixed upon November 17 as the big annual "pork day."

Over 2,000 persons attended the county farm bureau picnic at Santa Cruz, May 15.

The veterinarians of California and Nevada will meet in convention at Fresno, June 6.

Mariout barley is gaining in favor; Monterey County planted 5000 acres of it this spring.

San Jose is building a plant to place strawberries in cold storage for the soda water season.

Porterville, Tulare County, had a Valencia orange crop of 65 carloads, all shipped during May.

The first park commission of Corcoran, Tulare County, tackled the city's new park June 1.

In the Turlock section of Stanislaus County 3,000 acres of cantaloupes have been planted this spring.

At a recent hog sale at Fresno, one lot of 68 brought $9.10 per cwt., the highest price in many months.

Clovis, Fresno County, reports frosts cut the Muscat crop to 60 per cent of normal and Malagas to 30 per cent.

Sixty carloads of fatted cattle left one ranch at Woodlake, Tulare County, during the first two weeks of May.

A new factory at Kingsburg, Fresno County, will manufacture grape juice, grape syrup and other fruit products.

The movement of alfalfa hay in the San Joaquin Valley is officially reported as very light for this time of the year.

The California state board of examiners will hold examinations for prospective veterinarians in Fresno, June 6, 7 and 8.

A Holstein cow owned by R. H. Davis, of Modesto, Stanislaus County, recently produced 21 pounds of butter in seven days' official test.

The apricot crop in the Aromas district of Santa Cruz County is heavier than estimated at the late frost period and will run over 600 tons.

Farmers southeast of Bakersfield are fighting the sewer farm as overflows and waste water are damaging crops and endangering health.

The Watsonville, Santa Cruz County, chamber of commerce is trying out a new and promising mechanical device for picking apples directly into the box.

All ballots on the election of the voting board of the reorganized California Prune and Apricot Growers, Inc., should be at the San Jose office before midnight of June 6.

The largest "vacuum pan" or milk evaporating machine on the Pacific Coast has been installed in the Carpenter plant at Tulare. Its capacity is 12,000 pounds of milk an hour.

Southern California

The first carload of cantaloupes left Brawley May 21.

Imperial Valley tomato crop will run to about 200 carloads.

Ten cars of cantaloupes went east from Imperial Valley on May 25.

The estimated onion crop of the Coachella Valley is 750 carloads.

The Escondido Valley Poultrymen's Association is a new corporation.

Solano County shipped 38 cars of lambs on May 15, bound for Chicago.

More than 1,000 acres of grapes were set out in Imperial County this year.

Fontana, San Bernardino County, has 200 acres of spuds for shipping.

A "Festival of Dates" will be held at Indio, Riverside County, October 21-23.

Blythe, Imperial County, is shipping dressed chickens, under ice, to Los Angeles hotels.

Imperial Valley's first carload of cantaloupes brought $5950 in Chicago, $17.50 a crate.

Wintersburg and Smeltzer, in Orange County, shipped 3,300 sacks of beans by water last week.

Ventura County beet growers estimate the late rain will increase the beet crop 25 per cent.

Many volunteered fields of cotton in the Valley are up some two feet high and growing thriftly.

The apple growers of the Yucaipa Valley, San Bernardino County, held a banquet at Yucaipa, May 17.

The Auto Club has completed road signs so that Death Valley is now safe for autoists and other travelers.

San Bernardino County farmers report grasshoppers more numerous than ever before known in that section.

On May 19 the San Fernando Valley Alfalfa Growers Association was formed at a meeting held in Van Nuys.

The Escondido-Palomar district of San Diego County will hold a big two-day barbecue at Palomar during June.

Ventura County beans that were up passed through the rain without injury. Fields just planted must be replanted.

The Associated Lumber Dealers of Southern California will hold their annual picnic in Orange County Park, June 11.

More than a ton of apricots a day were picked from the Pioneer Orchard, Brawley, Imperial County, for the last half of May.

More than 1,000 carloads of Mexican tomatoes, bound for Los Angeles, have entered the United States at Nogales, Arizona, to date.

Unseasonable cold weather in the Coachella and Imperial Valleys has delayed ripening of apricots and cantaloupes about two weeks.

A big warehouse at Ventura was burned May 23, with a loss of more than $100,000, of which $70,000 was grocery supplies.

The president of the Santa Ana Walnut Growers Association says the walnut crop will be 40 to 50 per cent greater than last year.

The Anaheim Citrus Fruit Association has just completed a packing-house, which starts this week, and has a capacity of ten cars a day.

The Coast and General

San Francisco received its first car of Mexican watermelons the first week in May.

There are about 10,000 acres of alfalfa in Mexico, just across the line from Imperial Valley.

Western Washington reports possession of 1,250,000 hens producing annually 15,000,000 dozen eggs.

Travelers in the Red Lake district of Coconino County report having seen four mountain lions in one group.

Truck gardeners of the Hood River section of Oregon are shipping heavily of asparagus to Pacific Coast points.

The planting of alfalfa and other crops for hay in Arizona has increased 12,000 acres over that of last year.

The wheat crop in Arizona this year will be about 80 per cent of normal, according to the early estimates at this time.

A recent snow fall in the extreme northern range country of Arizona has at least temporarily relieved the water shortage.

A controversy over the line between Maricopa and Yavapai Counties in Arizona is to be taken to the supreme court for final decision.

Arthur Beloat of Buckeye, known as the calf roping champion of Arizona, was severely injured recently in an accident caused by the falling of a horse he was riding.

The growers of Pima cotton in Arizona will be represented in the Second World Cotton Conference to be held at Liverpool starting June 13, by Hon. Dwight B. Heard of Phoenix.

A considerable number of cattle have been shipped from the ranges of Arizona, especially from the sections where drouth is being felt most. For the first time in the history of that state the Yuma Valley is specializing in the feeding of steers.

Exports of Egyptian cotton from Alexandria to the various countries of the world show a marked decrease compared with the corresponding period of 1920. The imports of the United States from Egypt are only about one-tenth of that of 1920.

The Southwest Cotton Company, owners of 30,000 acres of land in the Salt River Valley, has been reorganized and the firm is to be known in the future as the Valley Ranch Company. At the present time there are three large ranches owned by this company.

The Phoenix chamber of commerce offered a $25 prize for the best slogan which should be typical of the Salt River Valley. More than one thousand answers were received. From these the committee, after spending several days going over them, selected the following as the official slogan, "Rich, Resolute, Ready, Phoenix, Salt River Valley."

State Immigration Commissioner P. R. Milnes has been busily engaged in returning to Mexico citizens of that country who were brought here last fall to harvest cotton. All but about 1,500 of the 14,000 have been returned. Before Mexican labor is again imported to pick cotton white labor will be given opportunity to sign up with the cotton association.

The Honey Situation

By E. H. Tucker, Economic Statistician,
First National Bank of Los Angeles

IT is only recently that the honey industry has become a specialized, important industry in the United States. This development has taken place almost entirely in the state of California and is to a great extent the result of the activity of cooperative marketing associations.

Heretofore, statistics as to honey production and consumption in the United States have been almost negligible, because of the fact that the production of honey was maintained as a side line by the average agriculturalist. The development of the honey industry upon a scientific commercial basis has created the necessity for accurate information as to honey production and for a careful scientific analysis of the honey situation. As a consequence, the research department of the First National Bank of Los Angeles and the Los Angeles Trust and Savings Bank has undertaken a careful study of the honey situation in the United States and the state of California. While it has been impossible to secure as detailed information as might be desired, because accurate statistics have not been maintained in the past, it has nevertheless proved possible to secure a considerable amount of accurate data with regard to the industry.

California produces approximately 15 per cent of the honey produced in the United States. Iowa is the second state, producing six per cent of the entire crop of the United States. New York, Illinois, Michigan and Wisconsin each produce approximately four per cent, and Pennsylvania, Georgia, Florda, Ohio, Indiana, Missouri and Colorado three per cent. No other state produces more than two per cent of the entire honey supply of the United States.

California alone markets the major proportion of its honey production outside of the state in which it is produced. As a general rule from 70 to 90 per cent of the commercial honey produced in California is marketed outside of the state and from one-third to one-half of the honey marketed outside of the state in which produced is California honey.

Careful estimates as to commercial honey production in California during the past 20 years are given below:

Year	Pounds
1900	2,208,000
1901	8,112,000
1902	5,125,000
1903	8,400,000
1904	1,040,000
1905	10,000,000
1906	4,510,000
1907	7,120,000
1908	4,524,000
1909	11,532,000
1910	4,080,000
1911	9,500,000
1912	4,710,000
1913	3,720,000
1914	7,950,000
1915	9,360,000
1916	8,100,000
1917	6,500,000
1918	5,500,000
1919	6,350,000
1920 (not final)	9,500,000

The chief of the field service of the department of agriculture estimates that 180,000,000 pounds will approximate the total honey production in the United States during 1916, and states that it is his belief that these figures are within 10 per cent of the actual production. Upon this basis it is estimated that the total production for the United States was about 150,000,000 pounds in 1917, 180,000,000 pounds in 1918, 210,000,000 pounds in 1919 and 250,000,000 pounds in 1920. It may be, however, that the 1920 production of honey in the United States totaled as much as 300,000,000 pounds. This is the estimate made by Dr. E. F. Phillip, apiculturist of the bureau of entomology.

Commercial honey is produced almost exclusively in the form of extracted, or bulk honey, although there are three forms in which honey enters the commercial market. Next in importance to extracted honey is comb honey, and there is a small amount of chunk honey sold upon the market. By chunk honey is meant that honey which is sold in the form in which it is taken from the hive, wax and honey being intermingled.

Practically all of the honey now produced in California is extracted honey. In 1916, 81 per cent of the California commercial production was sold in such form. In 1917, 82 per cent; in 1918, 90 per cent; in 1919, 97 per cent, and in 1920, 96 per cent. In the United States approximately 55 to 60 per cent of all honey produced is sold as extracted honey. Comb honey is relatively unimportant in California, production of such honey in 1920 amounting to only two per cent of the total amount of honey produced in the state. This is the result of the gradual change to extracted honey, as in 1916 approximately 18 per cent of California honey was sold as comb honey.

The production of comb honey is exceptionally difficult and its lasting qualities are such that it is hard to market comb honey outside of the state in which it is produced. As a consequence, the bulk of the comb honey sold in the United States is that produced and sold locally in various eastern states. In 1916 and 1917, 38 per cent of all the honey produced in the United States was produced in the form of comb honey. In 1918 the percentage was 31 per cent, and in 1919 and 1920, 30.5 per cent.

Approximately 10 per cent of the honey produced in the United States is sold as chunk honey. In California only from one to two per cent of all honey produced is sold in this form.

The principal markets for honey moving through the regular channels of trade are reported as Medina, Ohio; Cincinnati, New York City, Chicago, Kansas City, Philadelphia and Boston. It is estimated, however, that approximately 90 per cent of the honey produced in the country, with the exception of the California production, does not get 20 miles from the home of the honey producer.

In the past the markets for commercially produced honey have been, to a great extent, foreign markets. In 1919 there were 9,105,362 pounds of honey exported from the United States. The principal importing countries were the United Kingdom, which imported 2,882,951 pounds; France, 1,129,704 pounds; Sweden, 1,128,152 pounds; Belgium, 922,008 pounds; the Netherlands, 690,595 pounds; Denmark, 417,492 pounds, and Canada, 297,414 pounds. While these exportations to foreign countries during 1919 were slightly larger than normal exportations, because of the sugar shortage, they may nevertheless be taken as indicative of the proportion of American produced honey formerly absorbed by foreign markets.

At present these markets are being definitely closed to United States honey producers. In 1920 there were only 1,539,725 pounds of honey exported from the United States, almost 50 per cent less than total exportations to Great Britain during 1919 and approximately 83 per cent less than total exportations during 1919.

Several factors are closing these foreign markets to American honey producers. The first of these is the depreciation in foreign exchanges, which is making it exceptionally difficult for foreign countries to purchase American produced goods. This situation may be only temporary and the organization of the new $100,000,000 Foreign Trade Financing Corporation may materially assist in stabilizing exchanges. The other factor which is closing foreign markets to American productions is probably permanent. Throughout the world companies are being formed to further honey production. Cheap labor costs and inferior methods in handling honey will probably assure these corporations a comparative monopoly on foreign honey markets. The situation is made doubly serious by the fact that many of these companies are formed with the express purpose of exploiting United States markets. They are shipping quantities of extracted honey into the New York market. This honey, it is alleged, is sometimes shipped into the United States in containers, consisting of previously used casks, barrels, and even five gallon oil cans. This imported honey is not always produced under sanitary conditions and may even contain bacilli larvae, which are germs of a very contagious disease, similar in seriousness to the boll weevil in the cotton industry. Consequently, efforts are being made to secure an emergency protective tariff of not less than five cents per pound upon every pound of honey imported into the United States from foreign markets. The purpose of this tariff is not only to protect United States honey from competition with foreign honey, but is also to protect the honey industry from possible inroads which these larvae might make upon the bee of the United States, if importation is permitted to continue. A movement to require rigid inspection of imported honey and rejection of any honey containing injurious larvae could do much to correct this evil, but present attempts by producers seem to be directed toward efforts to secure tariff protection.

The United States honey industry is today definitely faced with the fact that it must rely almost entirely upon domestic markets in the future. In the past it has been the custom to market domestically produced honey in five gallon cans, containing 60 pounds of extracted honey. As a general rule two of these cans form a case. A considerable proportion of this honey was retailed direct from the can into containers belonging to the consumers.

The baking trade in the United States has used large proportions of the United States produced honey in preference to sugar, because it permits the holding of a certain proportion of moisture in baked goods. As commercial baked goods tend to dry and chip easily if sugar is used, honey is considered superior for sweetening purposes.

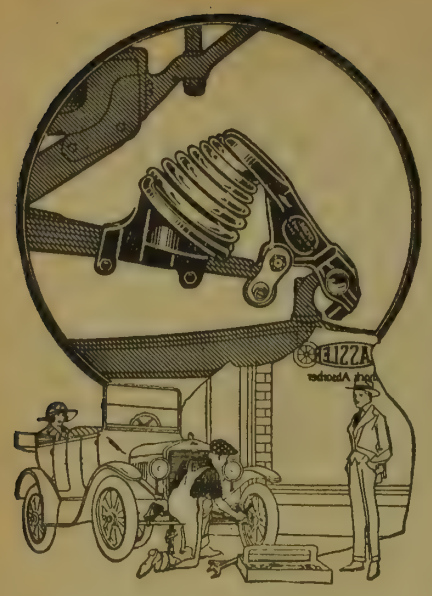
In order to better exploit local markets a new means of marketing honey is fast gaining in favor in the United States and is being pushed by cooperative honey associations in California. Honey is being put up for the retail trade in one pound, two and a half pound, five pound and ten pound friction-top cans, and eight ounce and 16 ounce glasses. These containers carry a label showing the name of the canning company and the source of the honey, so that its cleanliness can be vouched for. Active steps are being taken to develop larger home markets for this new form of honey. The food value of honey is unquestioned, as it contains 1,485 heat calories per pound.

High railroad freight rates are interfering with the marketing of California produced honey, and active steps are being taken to secure a reduction in these rates so that California honey can enter the eastern markets of the United States. With the development of water transportation through the Panama Canal, it is anticipated that increasing amounts of California honey can enter eastern markets at cheaper transportation costs. It is being found that cooperative marketing of honey, as at present carried on in California, is reducing the cost of marketing honey by several cents per pound, thereby assisting in profitable marketing. The California Honey Producers Cooperative Exchange, with head offices in Los Angeles, markets the honey of approximately 85 per cent of the California commercial producers.

The problems with which the honey industry of the United States, and particularly of California, are faced today are, therefore, three-fold. The first is the securing of an effective means of excluding any infected foreign honey; the second is a reduction in freight rates to eastern markets; the third is the preparation of honey in more marketable forms and the development of larger consumption in the United States. The first of these problems will require congressional action. The solution of the second will be made easier through the development of water transportation through the Panama Canal and the ready response which is being made in retail markets to the new forms of marketing honey will go a long way in solving the third problem.

Honey prices have dropped materially in the past year, because of general readjustment and because of the closing of foreign marekts. While in 1918 and 1919 and the earlier part of 1920 the prices for the better grades of California honey in Los Angeles markets ranged between 18 and 23 cents, these prices have now dropped to as low as 12 and 13 cents. Predictions as to future honey prices cannot be made with any accuracy today, but indications are that with the development of new domestic markets the excess honey formerly shipped to foreign countries will tend to be absorbed in the United States.

About 4,000 people assembled at Glendale, Arizona, on May 20 to celebrate the presentation of the deed to a ten acre tract of land by Acting Governor Hall to Geo. W. Rommel for the U. S. government. This tract of land is to be used for a government poultry experiment station. The equipment and stock now at the government ostrich farm, seven miles west of Glendale, will be removed and more added on the new site.

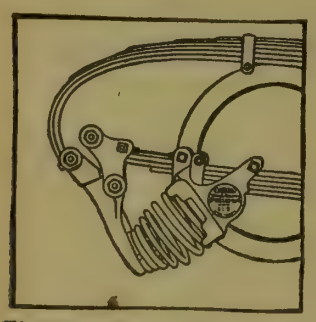


"Hasslers" without tying up your Ford

NOTHING complicated about Hassler Shock Absorbers. Nothing to change about the car! Any garage man can apply them — easily — quickly — correctly!

Think of such a small amount of time — and such a small expense — securing for you a saving of one-third of your tire and up-keep expense, that will make your car last one-third longer! They protect the car against the destructive bumps and shocks — they eliminate vibration.

Try Hassler Shock Absorbers—at our risk—for 10 days. You can get them for any Ford model — and also the 1-ton Truck. Write us if you do not know your dealer.



This illustrates the Hassler model now made for the Dodge Brothers Car—giving it perfect luxury and added smartness. Four Hasslers to the set—and they do not change any part of the car. Ask your Dodge Dealer.

Conference of County Horticultural Commissioners

This important convention was held at Sacramento, May 25-28, and was participated in by the director of agriculture and his staff, together with all the horticultural commissioners of the state. The program dealt with the following subjects: Review of the text and intent of senate and assembly bills, problems in pest control, grasshopper campaign, prevention of intercounty spread of pests and diseases, nematodes, disinfection of nursery stock, parasite distribution, rodent control, disinfection vs. inspection, parcel post problems, can our present methods of disposing of imports of nursery stock be improved, the need of caution in the disposition of imports of plant products, automobiles as a factor in plant quarantines, dissemination of information to state quarantine guardians on general quarantine procedure, consideration of the text and intent of senate bill 273, economic poison act, and lime-sulphur solution vs. dry preparations. Friday was given to discussion of standardization of fruits and farm produce, laws, etc.

Linda Avocado

Weight of this fruit is 2¾ pounds; circumference, 13¾ by 14¾ inches; height, 6¼ inches. It was grown by L. D. Oliver, Orange County.

At 1:30 p. m. on Monday Director Hecke formally opened the conference. He explained briefly the aims and objects of legislative measures enacted at the last session of the legislature and paid a tribute to the splendid work of the agricultural legislative committee in supporting such agricultural movements.

Wm. Gould, president of the County Commissioners Association, presided as chairman on the first day of the conference.

Standardization

F. W. Read, specialist in standardization, explained in detail the new fruit and vegetable standardization law, S. B. 201, passed at this session of the legislature and now before the governor for his signature. This law expressly provides that all grapes for both table and manufacturing purposes must meet the minimum sugar content prescribed in the act. This in itself, it is felt, is a great step in advance in the proper marketing of California grapes. The grape industry has grown so rapidly that at the present time it is one of the most important shipping industries in the entire perishable produce business.

This law will probably become effective about the first of August and thereafter it will be illegal to market strawberries in anything but a pint basket. A standing committee from the horticultural commissioners has been appointed to confer with Mr. Read and to draw up details surrounding the enforcement of the standardization law during the next two years.

Control of Mealybug

The Tuesday morning session was devoted largely to pest control, the mealybug, grape mildew and vacuum fumigation being the principal topics under consideration. The outstanding feature of this discussion, however, was the matter of the distribution and control of the grape mealybug. Realizing the ever present danger of introducing the mealybug into non-infested territory through the medium of picking boxes, the state department of agriculture, with the cooperation of the county horticultural commissioners, for some time has been working upon a practical and feasible means of cleansing the empty picking boxes that are moved from place to place. Steam, hot water, sulphur and fumigation have been repeatedly tried out in an effort to find a cheap and efficient method of sterilizing empty containers.

At this time Alameda County, through the horticultural commissioner's office, has been particularly energetic in an endeavor to keep Alameda County free of mealybugs and excellent results have followed the work under Commissioner Seulberger's direction. Through an agreement with the canners and driers of Alameda County all empty pear containers are sterilized as soon as the fruit is dumped and are thus returned to the orchards perfectly clean. Up to the time that this practice was put in operation the failure to sterilize the containers had resulted in the introduction of mealybugs into apricot orchards of Alameda County.

It is understood that as a result of this conference a meeting of pear and grape growers will shortly be called to devise practical ways and means of sterilizing empty containers.

Under the auspices of the pest control service of the California department of agriculture, a discussion of vacuum fumigation of nursery stock more in the nature of a progress report was elaborated for the information of the county commissioners.

To Visit Reno

Pursuant to request made by the state of Nevada upon Director Hecke for assistance and cooperation in handling the alfalfa weevil situation, there was disclosed as alarming in the vicinity of Reno, Nevada, an agreement was reached at the convention of county horticultural commissioners by which a representation of California commissioners, together with state officials of the department of agriculture, will visit the infested region at an early date.

Entomologist Harry S. Smith, in charge of the pest control service, having recently returned from an investigation of the Reno districts where the outbreak of alfalfa weevil has now reached serious proportions, gave the California horticultural commissioners first hand information on the outbreak.

LIME FOR ORCHARDS

In an article on "Lime for Orchards," P. J. Carmody, chief orchard supervisor for Victoria, Australia, dealing in a practical manner with the effect of lime on fruit and fruit trees, and advocating its use, writes:

"When it is considered that the average crop of fruit requires more plant food for its development than an average crop of wheat, and, moreover, that the fruit demands the same soil constituents year after year, the necessity for a sweet and favorable medium for root pasturage is apparent; and as no other application is at all comparable to the influence of lime for this purpose, its frequent use is urgently required. It is a matter of common observation that the fruit buds of trees grown on sour soils are of a weak or indefinite character, while the bark is harsh and dry in appearance and the growth more or less stunted. Under such conditions it is practically impossible to develop trees on the most profitable lines without first correcting soil acidity by the free use of lime in the same manner as requires to be adopted for other farm crops.

"In many parts of the state insufficient attention has been given to this feature of soil management in the orchards. Particularly is this the case where fruit is grown on heavy clay soils. In these soils fruit trees grow through a lengthy period, so that a considerable quantity of immature wood is produced to the detriment of subsequent crops of fruit. Measures have not hitherto been adopted to definitely determine the actual effect of lime on the different parts of the tree; but investigations in other countries show that on soils rich in lime the wood is matured earlier and the fruit buds are more stocky and robust than is the case with trees grown on soils deficient in lime. This is very apparent to anyone acquainted with the fruit areas of many parts of Gippsland and other places in Southern Victoria, and one is struck with the unusual prominence or length of the fruit buds, the relative distance between the nodes, and the softness of the wood in these districts when compared with the same varieties grown in fruit centers known to possess lime in abundance."

THE GOPHER INJURED TREE

Much damage has been done during the past season by the attack of gophers on trees. Orchards have been observed where from five to 20 per cent of the trees were either partially girdled or entirely girdled. If such trees are not treated, then the production of the entire orchard will be greatly reduced.

Whatever the cost of bringing an orchard to bearing, that cost must be divided amongst the individual trees. If there are 80 trees, then each tree must be charged one-eightieth the cost of production. That puts a value on each tree, and if any are lost it reduces the value of the orchard in proportion to the number of trees lost. Trees injured by gophers can be saved if they are properly treated.

In order to demonstrate the methods of saving gopher injured trees the agricultural extension service for Los Angeles County is to conduct a series of 11 field meetings during June, under the auspices of the farm bureau, the schedule being as follows:

Wednesday, June 8, 10 a. m., San Gabriel, place of W. D. Ring; 2 p. m. Otterbein, place of Geo. A. Crawford; June 9, 10 a. m., Baldwin Park, place of V. R. Long; 2 p. m., Rivera, place of Albert MacDonald; June 10, 10 a. m., Pasadena, place of Wm. Pollard; 2 p. m., Covina; June 13, 10 a. m., La Canada, Bullock's ranch; 2 p. m., Hansen Heights; June 14, 10 a. m., San Fernando; 2 p. m., Chatsworth; June 15, 2 p. m., Charter Oak, place of W. C. Davenport.

RIPE OLIVE PACK

The California Olive Association makes public today the last season's figures for the state's ripe olive production, amounting to 137,000 cases of ripe olives, each case containing 24 standard quarts. This is more than a 50 per cent decrease in the pack of ripe olives as compared to last year, and is accompanied by a 50 per cent increase in oil output over the previous season. The pack of ripe olives in 1919 approximated 282,000 cases.

The variation is due entirely to market conditions, as the crop this year was, if anything, a little greater than that of the year before. Indications are that next season's crop will be exceptionally large in the south and in the north there are signs that the yield may nearly equal that of the past season, when the crop was heavier than usual.

WEEDS IN ROADS AND PATHS

The United States department of agriculture has tested a large number of chemicals for the purpose, but most of them are either ineffective or too expensive; but three substances have been found generally satisfactory. They are sodium arsenite, oil, and common salt. Sodium arsenite is the most powerful plant poison known that is cheap and readily prepared, and is the active constituent of practically all proprietary "weed killers." It is rather difficult to obtain ready made, and should be used while fresh, as it oxidizes readily and hardens when exposed to the air for several weeks.

For persons having some experience in the handling of chemicals sodium arsenite can readily be made at home according to one of the following formulas:

Formula No. 1

Caustic soda (sodium hydroxide), 2 pounds.

Or high grade concentrated lye, 3 pounds.

White arsenic (arsenic trioxide), 4 pounds.

Water to make 1 gallon.

The caustic soda should be in the granulated form and of the grade known as 95 per cent, technical. This quality of caustic soda is sold in drums containing five pounds or more and can often be obtained from dealers in laundry supplies. For small operations the pure caustic soda, which comes in the form of sticks, is convenient. White arsenic is a fine white powder which is easily obtainable. Mix the caustic soda or lye with the white arsenic in a wooden, earthenware, or graniteware receptacle. Add the water slowly. In about 30 seconds the solution will begin to boil violently and should be stirred vigorously with a wooden paddle. The heat generated is usually sufficient to cause all the arsenic to dissolve and the mixture to become a gray, syrupy liquid. In case some of the arsenic remains in suspension, however, it will be necessary to heat the solution until the arsenic disappears. After cooling thoroughly add enough water to replace evaporation.

Formula No. 2

Washing soda (sodium carbonate or sal soda), 8 pounds.

Or soda ash (anhydrous sodium carbonate), 4 pounds.

White arsenic (arsenic trioxide), 4 pounds.

Water to make 1 gallon.

This mixture does not generate heat upon adding water, and must be boiled to bring the arsenic into solution. In either of the above formulas one gallon of the solution contains four pounds of soluble arsenic trioxide, or approximately 5 1/3 pounds of arsenite of soda.

To prepare the weed killer solution dissolve five pounds of prepared sodium arsenite or one gallon of the above stock solution in 50 gallons of water. The amount used per given area depends upon the character and size of vegetation, the weather, and method of application. For average conditions 600 gallons of the weed killer solution are required per acre, or one gallon of concentrated stock solution would make sufficient weed killing solution to cover an area 60 by 60 feet.

Chemical weed killers give the best results on a cloudy, humid day, when rain is not expected within 12 hours. Treatment should not be given while the soil is wet, but if it is very dry it should be moistened slightly to prevent the chemical from soaking in too rapidly. When the vegetation is large it should be mowed before treatment, after which it is well to wait several days before treatment, allowing the vegetation to partially resume growth and exhaust the roots.

POISONING GREEN TIMBER

Of late years the action of arsenic has been introduced with marked success in hastening the killing of timber by the ringbarking process, and trees that ordinarily would take months to kill by the old method are now killed in a few weeks, and frequently in a few days, by the application of arsenic. Arsenic—the ordinary white arsenious oxide of commerce—is not soluble in water to any great extent, so that soda, either the ordinary washing soda or caustic soda, has to be used to dissolve it. When large amounts of the solution are required, washing soda will be the cheaper, but for small quantities of solution caustic soda will possibly be found the handiest. When preparing the solution, whether caustic soda or washing soda is used, first dissolve the soda in a convenient amount of water, using heat if desirable to assist and hasten it; then slowly add the arsenic, previously made into a thin paste, stirring all the time. Place on a strong fire, and after it has come to the boil allow it to remain boiling for at least half an hour. Stir from time to time, and be careful to stand away from the fumes, as being poisonous they are apt to cause sickness. When the arsenic is thoroughly dissolved the solution may be made up to the required bulk by adding the remainder of the water, either hot or cold. A useful strength for quick and effective work in all kinds of timber is as follows: Arsenic, 1 pound; washing soda, 1 pound; or caustic soda, ½ pound; water, 4 gallons; whiting, ½ pound. The addition of this whiting is merely that it may serve as an indicator on trees treated, as it turns white on slightly drying, making it quite certain what trees have been operated on. An empty kerosene can makes a useful measure for dissolving in, as it holds four gallons.—Tasmanian Fruit Grower.

TALK RICE, BUY RICE, EAT RICE

The rice association of California suggests:

Saturday, June 11, has been proclaimed California Rice Day by Governor Stephens.

Eat California rice as a vegetable, as a breakfast cereal, as a dessert—it is nutritious and delicious.

California rice has over four times the food value of potatoes.

The California rice industry has grown to $20,000,000 in less than ten years. It has increased the value of thousands of acres from $10 to $150 and $200. It is the best rice grown anywhere.

Make it a daily habit to eat California rice, a perfect food.

Buy at least five pounds of California rice on Saturday, June 11.

AVOCADO VAGARIES

A recent issue of The Country Gentleman contains an article on avocados, by a Californian, which begins: "The avocado, more commonly known as the alligator pear"—etc, etc. We object. Californians know it and speak of it only as avocado. Another quotation: "A variety known as the Lyon appears to be producing the best results." One has but to read the official report of 1920 of the varietal committee and its 1921 report, published in the Cultivator of May 28, 1921, to get a full and sufficient answer to this rankly untrue statement. The acreage given (500) should be multiplied by not less than four. "One type of tree now being planted extensively grows up in a compact cluster instead of spreading out over much ground. These can be planted 11 feet apart in the rows, 360 trees to the acre. Such trees have been coming into bearing the third year and yielding from 30 to 60 pears each from the third to the fifth year." We are still searching for an orchard planted "360 trees to the acre."

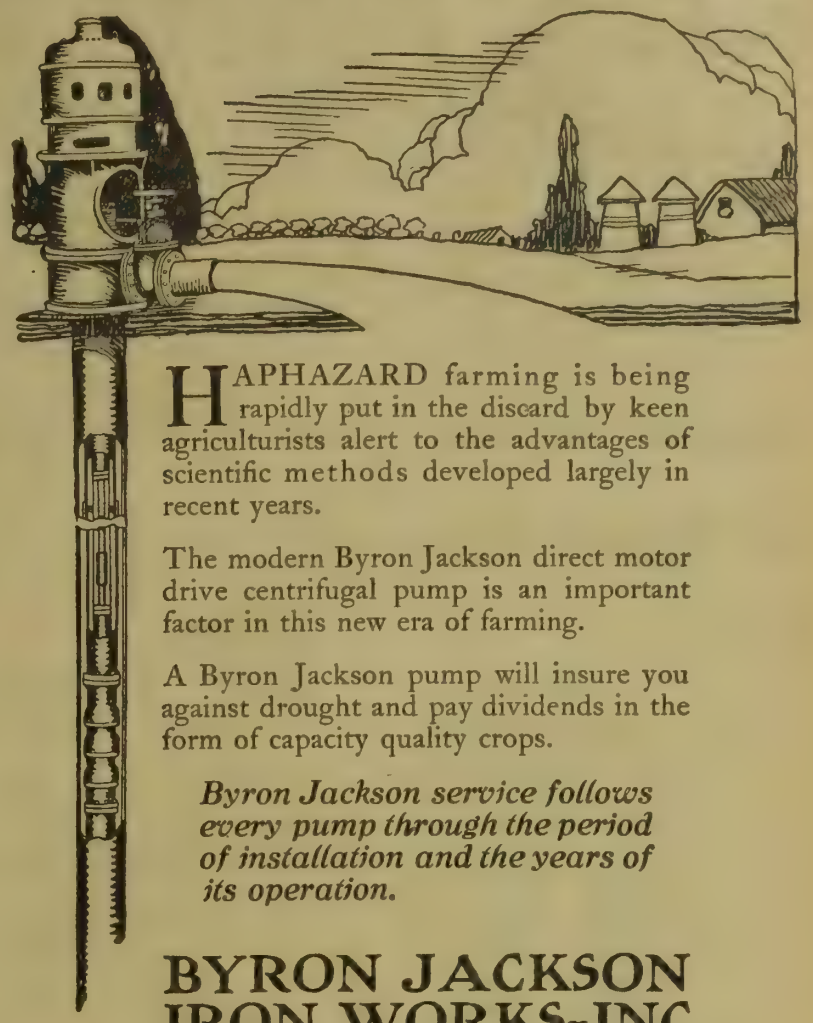
COTTONY CUSHION SCALE IN SICILY

It has been found that Icerya Purchasi is such a pest upon the Spanish broom, Spartium junceum (common in California gardens), that it has been advised to clear the Italian hills of this and another practically leafless species. The reason is because the scale breeds in the sun and soon becomes so thick upon the shrubs as to kill them. On the other hand, the vedalia or Novius cardinalis, the parasite, will not breed in the sun and therefore inhabits no plants practically leafless. On the latter class the Italian investigators found an absolute absence of the larvae of the lady bug on plants weighed down by the scale.

MANURES AND SOOT

A recent investigation in England as to the relative value of animal manures and also of soot finds them with the following nitrogen content: pigeon 2.75; sheep, 1.80; soot, 1.20; poultry, 1.10; horse, 0.45. In phosphoric acid they stood: pigeon, 2.50; poultry, 1.15; sheep, 0.60; soot, 0.40; horse, 0.40. In potash content they ranged: Sheep, 2.00; pigeon, 1.50; poultry, 0.95; horse, 0.45; soot, 0.20.

Crop insurance



HAPHAZARD farming is being rapidly put in the discard by keen agriculturists alert to the advantages of scientific methods developed largely in recent years.

The modern Byron Jackson direct motor drive centrifugal pump is an important factor in this new era of farming.

A Byron Jackson pump will insure you against drought and pay dividends in the form of capacity quality crops.

Byron Jackson service follows every pump through the period of installation and the years of its operation.

BYRON JACKSON IRON WORKS-INC

408 Sharon Building, SAN FRANCISCO

Wherever water is to be lifted

We Have an Unusually Fine Stock of

Fruit Bearing Trees

For Delivery Next Season

Some of our good customers and friends think of us as being a strictly ornamental nursery, but we wish to correct such an impression.

Our sales of fruit trees this last year represented a large percentage of our total sales.

Our stock of both ornamental and fruit bearing trees will be larger this coming season than heretofore. There will be, however, many varieties of trees that we shall be short of again, and we therefore recommend your placing your order with us as early as you can conveniently do so.

If you will send us your name and address we will mail you our new price list when printed.

Geo. C. Roeding, President

California Nursery Co.

Niles, Cal.

Grape Culture in Arizona

By M. E. Bemis

MUCH interest has been shown in grape culture in the Salt River Valley within the last few years. While cotton had a tendency to overshadow all other crops, grape growers have had splendid success.

Grapes have been grown throughout the Salt River Valley for many years. The home orchard of any Salt River Valley farm is considered incomplete without a few grape vines. Arbors among the buildings of many farms serve a triple purpose—that of ornament, shade and delicious fruit; incidentally considerable revenue. On most of these farms grapes are given comparatively little attention, i. e., not the attention that the commercial grower who cultivates his grapes in a vineyard finds to be profitable.

While grapes have been grown on a commercial scale, no special effort has been made to develop the industry. Grapes are shipped out in carload lots. Reports of the Salt River Valley Water Users Association for 1919 indicate that the average yield was about 7,000 pounds per acre. Approximately the same yield was obtained in 1920. In 1919 the crop averaged the growers a fraction over 11 cents per pound. In 1920 the price was seven cents.

Those who have given the matter careful attention believe that there is a great future for the grape industry in the Salt River Valley. At present the acreage is comparatively small, probably about 350 acres, not including approximately 100 acres set this season. The nurseries have set out large quantities of cuttings this year for the next season. Growers are confident that this will become a great grape growing section and the probability is that at least 1,000 acres will be planted out in 1922.

The Thompson Seedless has proved to be the most valuable variety for this section and this variety stands shipment well. Sufficient data has been obtained to determine that grapes grown here can be shipped successfully to the eastern markets. Other good varieties are the Mission, Muscat and Malaga, but the very remarkable success of the Thompson Seedless puts this variety far in the lead. The sugar content of grapes grown here is high. A material advantage is that the Salt River Valley grapes attain the stage of marketable sugar content some two to four weeks earlier than the same varieties in California. Here grapes ripen during July and just before the grapes of the San Joaquin Valley in California are ready for the market.

W. F. Openshaw of Mesa, an experienced grower, last year sold $5,000 worth from eight acres. This was of course a very good yield and an exceptional price. In regard to the cost of growing a vineyard, Mr. Openshaw says that in recent years he has paid two cents a vine for pruning. To tie up and stake takes a little over two days per acre. The stakes cost at the present time about $40. Mr. Openshaw states that his grapes pay him as well or better than any other farm operation.

Grapes here are comparatively free of insect pests and plant diseases. Careful investigators believe that the grape growing industry will make this one of the best known and most profitable grape growing sections of the Pacific Coast.

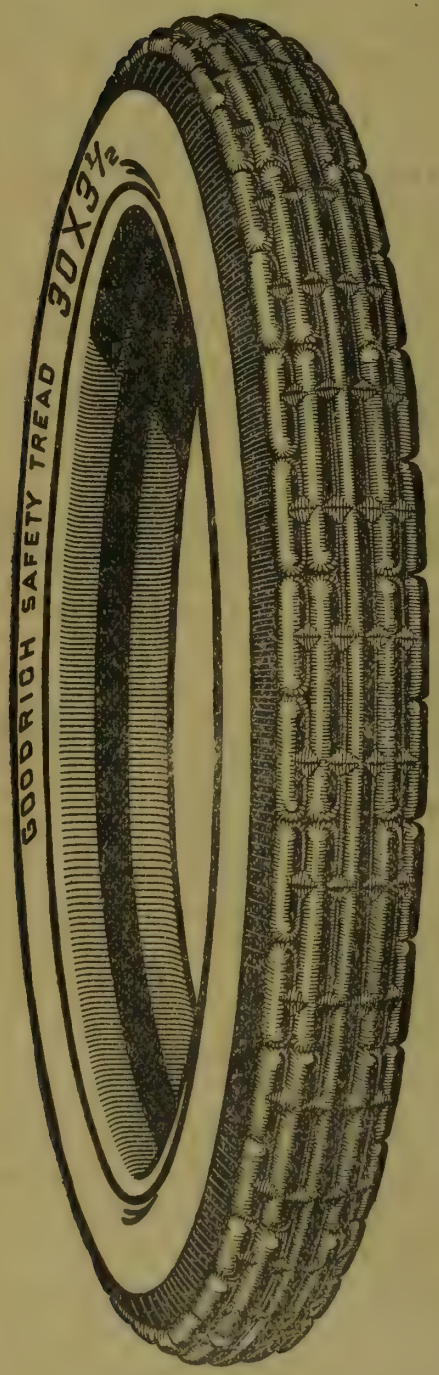
The *finest Tire* for Small Cars

Goodrich

30x3½

Anti-Skid Safety Tread

at the 20% Price Reduction



Goodrich 30x3½ anti-skid safety tread fabric tire now available at the 20% Price Reduction which went into effect May 2nd

Here is a 30x3½ tire, with snappy black tread and creamy white sides—clean, trim, splendidly finished—generously large and full in size, with the Goodrich anti-skid safety tread.

This tire will give you much longer mileage, the greatest of durability, the utmost riding comfort and the fullest satisfaction.

Like all other Goodrich tires the "30x3½" is made only in one quality. It is so thoroughly and unusually good that its makers frankly declare it the best tire ever made for small cars.

THE B.F.GOODRICH RUBBER COMPANY
Akron, Ohio

Dealers everywhere are selling Goodrich Silvertown Cords, Goodrich Fabric Tires and Goodrich Red or Gray Tubes—all one quality—at the 20% reduction in prices which Goodrich made effective May 2nd, 1921.

SAN FERNANDO VALLEY GRAPES

By Prof. F. T. Bioletti

DURING April the writer was able to spend a day in making a survey of the San Fernando Valley as a possible grape growing district. Vineyards of various sizes and varieties were seen in several parts of the valley. Most of them are situated on the lower slopes along its easterly rim, but a few were found on the main floor. Most of the soils were light in texture but various types were noted varying from gravelly wash to clay loam. Where the vines showed evidence of having received proper treatment they were healthy and vigorous.

My general impression is that the valley is well suited to grape growing, though, for the best results, care must be taken to select the most favorable situations as regards climate, soil and water conditions.

The climatic conditions seem excellent in all parts of the valley with perhaps the exception of the lower middle portion, where spring frosts may be too frequent and where mildew may be prevalent. The frosts of this year, however, are exceptional and there are few vineyard districts where spring frosts do not occur occasionally. Mildew can be controlled at moderate expense by proper sulphuring.

The soils on the whole appear very favorable. The vine prefers a deep, fertile soil. A soil only two or three feet deep may give good crops if it is fertile and if irrigation is applied frequently during the growing and ripening season. A soil of moderate fertility may give good crops if sufficiently deep and well supplied with water. For the best results, however, depth, fertility and sufficient water are required.

There is probably not sufficient rain in any part of the valley for the best crops so that supplementary water from irrigation is needed. In some parts, notably in the lower slopes of the rim, vines might do fairly well on deep soil without irrigation, but these cases are few and even here some irrigation would be necessary for large crops and continued health of the vines in dry seasons. In most places about 12 acre-inches would probably be required. On the steeper slopes irrigation would be difficult but could be rendered possible in some cases by laying out the vineyard with proper regard to the contours of the land.

Most of the vineyards seen were planted with wine grapes, of which several varieties were doing well and yielding fair to good crops. Raisin grapes are not likely to be very successful owing to difficulties of drying and competition with districts more suited to this branch of grape growing. Table and shipping grapes for local and eastern markets are most likely to be profitable. Of the last type, those which seem to offer the greatest chances of success are Muscat of Alexandria, Emperor, Cornichon, Malaga, Tokay, Marvel of Malaga, Sultanina (Thompson), Rose Sultanina, Black Monukka.

Summary

The San Fernando Valley seems very suitable for grape growing, but careful choice of soil, of situation, and of variety is necessary.

Irrigation is necessary to supplement the rainfall.

The slopes and higher parts of the valley around the rim offer the most favorable situations where the soil is deep and fertile and irrigation feasible.

Any of the varieties mentioned are likely to be profitable, except perhaps the Tokay and Sultanina.

In the lower parts, Muscat, Cornichon and Molinera might give good results where spring frosts are not too frequent.

Montgomery Ward & Co.

RIVERSIDE TIRES

Special Sale Price

$10.45

30x3½

This price good only until July 31st

Guaranteed **6,000** Miles

Shipping Weight, 13 Pounds

RIVERSIDE TIRES are NOT Seconds. They are clean, factory firsts of the highest quality—guaranteed by us to be made as good as tires can be made.

Each tire has our trade-marked name—"Riverside." And the name "Riverside" stamped on a tire is as good as the name "Montgomery Ward & Co." written on a check.

An Absolute Guarantee By Montgomery Ward & Co.

We do not believe there is any firm from whom you buy tires that has an equally old, time-tried Guarantee of "Satisfaction or Your Money Back."

For over forty-nine years, Ward's has sold everything on a Guarantee basis. Millions of customers in that forty-nine years have bought hundreds of millions of dollars' worth of merchandise under that Guarantee.

So, no thinking person can have any doubt, any hesitancy ordering a Ward's Riverside Tire—with the full knowledge that our forty-nine-year-old reputation will be lived up to absolutely.

We guarantee Ward's Riverside Fabric Tires for 6,000 miles. We mean exactly that.

We guarantee Ward's Riverside Cord Tires for 10,000 miles. We mean exactly that.

There can be no risk whatsoever in your ordering a tire from Montgomery Ward & Co. We know that the prices we quote are very low. But the saving we offer is a real saving on the finest grade of clean factory firsts.

Save One-Third on YOUR Tires, TOO!

Read what we say here about prices: "The Plain Truth about these Low Prices"—and then send your order now.

With an absolute guarantee, backed by a house of unquestioned reliability—Why not at least try Ward's Riverside Tires? Why not save one-third on YOUR tires, too!

The Plain Truth about these Low Prices

First let us say that we believe you will ***never again buy tires at such low prices***—unless there is some great discovery of a new way of making tires.

Just consider that before the war, rubber was 60 cents per pound and formerly it was $1.10 per pound. During the war, rubber actually went down to 50 cents per pound.

Last spring the tire business was demoralized. Rubber went to 18 cents per pound. Cotton broke from 40 cents per pound to 12 cents. It is said that 40,000 people moved away from Akron—the great tire making city.

And there, with everything at the low mark, was the opportunity we are always looking for, with cash in hand, to secure a saving for our customers.

With some great change in making tires—some discovery—you may some time in the years to come buy tires cheaper. But otherwise, Ward's prices in this Summer Sale will be the lowest prices at which you ever bought standard, high grade guaranteed factory firsts.

Do You Own a Buick, Packard, Cadillac, or Hudson?

We quote here our great Mid-Summer Sale Price on a 30x3½ tire for Overlands, Fords, Maxwells, Dorts, Chevrolets, etc.

But you who own Buicks, Packards and other cars, write for the book below, our July-August Sale Book. It offers you a saving of one-third on all sizes of Fabric Tires—and on Ward's Riverside Cord Tires—guaranteed for 10,000 Miles.

MONTGOMERY WARD & CO.

Chicago Fort Worth **Portland, Ore.** Kansas City St. Paul

NOW is the time to Buy
Mid-Summer
SALE!
Carefully study these low prices, order now every thing you need and there will be a big cash saving for you.
Montgomery Ward & Co.

This Great Sale Book is YOURS—FREE!

Ward's Great July-August Sale Book is ready. It quotes Ward's low prices on all sizes of tires—offering a saving of one-third. On tubes and many other automobile needs the saving is very large.

But there are all kinds of merchandise in this great reduced price sale. Wearing apparel for women, men and children; woolens and silks and cotton goods at startling prices. Everything for the home, for the farm.

We have tried to make this book a complete offering of your Mid-Summer needs—at wonderfully low prices.

One book is Yours—FREE! Fill out now, this coupon, and send it to the one of our five houses that is nearest you.

June in the Vegetable Garden

Northern California

By A. R. Gould

THE late rains should encourage all our growers to continue seed sowing of the more important root crops, and it is well to remember that now is the time to prepare for the winter supply, as very many of these may be put in storage and will certainly be of value later on, so that a word to the wise should be sufficient. Weeding will also be an important item in the day's work and cultivating is essential to conserve the moisture for many weeks to come. Clear off all old crops such as early peas and broad beans, get these plots well manured and trenched ready for another crop. No need to let this land lie idle long. Many crops, such as onions, lettuce, etc., when sown in permanent rows are usually sown too thickly, and there is considerable waste unless the seedlings thinned are transplanted, and it is generally a good plan to plant out several extra rows from these thinnings. Turnips, carrots and beets may also be transplanted in the young stage.

Onions

You can hardly grow too many of this useful vegetable, as it can be used in so many ways. The main crop varieties, such as Australian Brown, Ailsa Craig and Prizetaker, are all long keeping varieties, so that they may be stored away for winter, care being taken not to bruise them. They should be hung up in a cool, dry cellar. Late sown varieties should be thinned to at least six inches apart. Irrigate between the rows at least every two weeks and frequently cultivate. It is fatal to let them get dry during the growing season, as they will soon run to seed.

Potatoes

The soil should be drawn up in rows towards the plants to support them and protect the tuber. Main crop varieties may still be planted for late fall and winter use. Plant in rich soil, the plot formerly occupied with peas being used advantageously. Watch for any diseased plants, remove and destroy at once.

Tomatoes

If you wish to train a few plants of tomatoes, they must be staked and one or three main stems be selected to tie up. All axil shoots must be removed as they develop and usually three or four bunches of fruit only to the branch or main stem are allowed. This gives good quality fruit. Some prefer to have the plants ramble on the ground and this method is very successful, and the one adopted by those who grow them by the ton for the canneries. The young plants need a little protection from the hot sun for the first few days after planting and should be watered until well established. There is still time to put out a few plants. Space them four feet apart each way.

Squash, Musk and Watermelons and Cucumbers

Until these plants get established keep them well watered and thin out the plants, leaving the three strongest to a hill. The small lemon cucumber should be in every garden. Seeds may still be sown.

Turnips

Thin out Early Snowball sown last month and towards the latter end of the month sow White Egg very thinly on rich soil in rows 20 inches apart.

Corn

Make a sowing of corn for successional supply. Sow three seeds to a group about three feet apart of the following varieties: Country Gentleman, Golden Bantam and Stowell's Evergreen. Field corn varieties are Leaming and Wisconsin White Dent. The corn plot should be well cultivated and the wheel cultivator is just the thing.

Leeks and Celery

Complete the planting of these important crops this month. Plant seedlings in the prepared trenches.

Carrots

On rich soil sow Danvers Half-long for succession in rows 18 inches to two feet part. These are easily stored for winter use, hence it will be advisable to sow a few extra rows.

Beans

For successional supplies sow Stringless Green pod, Golden Wax and Kentucky Wonder. Also the small White Tepary, which is quite a useful shell bean. Those sown last month should be making good growth and will need cultivating.

Cauliflower

On a well prepared seed bed sow Autumn Giant and Early Snowball towards the end of the month in rows or broadcast. Also prepare your plot by trenching with manure.

Strawberries

Cut off all runners to insure continued fruiting, as these young plants take away the strength from the parent plant.

Southern California

By D. F. Reichard

DID you take advantage of the rain we had last month? If you did not you are not getting the best out of your garden. Work over your whole garden, breaking up the surface. This should be done at once. Go over it with a rake or harrow, anything to break up the crust formed by the rain.

The rain was certainly great for us gardeners. Even though it drowned out some of the newly sown beans and cucumbers it surely put moisture in our gardens when it was needed. Now it is up to us to conserve it by working up our gardens and leaving a fine mulch on top. Having the ground in such excellent condition gives all of us an incentive to plant stuff that will carry our gardens on through the summer. The weather has been so cool this spring that the tender crops like corn, beans and vines have not made their usual headway. This means that these varieties put in now at the beginning of our warm season will come on rapidly and be ready to harvest almost as soon as stuff put in a month or six weeks ago.

June is an ideal month for planting vining crops such as Hubbard and Pikes Peak winter squash, field pumpkins, cucumbers, summer squash and melons. Plant these plants on the edge of furrows and train the vines of two rows together so that they may be irrigated and cultivated without disturbing the vine runners.

Beans of all varieties planted this month will do well, especially Kentucky Wonder pole beans and Stringless Green Pod bush beans. Do not forget to put in some lima beans, they are very satisfactory. When planting these use plenty of seed—a pound to 120 feet of row. All varieties of corn should be planted. Sweet corn, field corn, also sorghums and Kaffir corns may be put in any time during June with full assurance of success if given ordinary care. Open up a furrow and drop your seed in the bottom of it, cover the seed with an inch and a half or two inches of damp soil, pressing it down firmly. As the young plants grow cultivate the ground and gradually fill in the furrow. Plant a new patch of sweet corn every two or three weeks.

Be sure to work up around all plants in the garden, thinning out where stuff is too close so as to give the growing crops a chance to develop properly. When your vining crops attain their fourth leaf thin to two plants to the hill; if you leave more the crop will be very small.

If more tomato, eggplant or pepper plants are needed for the summer's supply there is time enough yet to put the plants in. Be sure to put about a quart of water around the plant as soon as it is set to settle the soil about the roots. To keep a continuous supply put in a few beets, carrots, radishes, Iceberg lettuce, and green onion seeds. Be sure that the seed bed has been worked up nice and fine so that it will hold the moisture to get your seed up and the plants nicely started before artificial moisture will be required.

Plant everything in rows with room enough between to allow irrigating and cultivating, because before the month is over we will no doubt have to start using water. When water is needed for your plants supply it by opening furrows beside the rows of plants and allow the water to run slowly through. As soon as your soil will work up without sticking to the tools, cultivate.

If any plants are backward apply a spoonful or two of commercial fertilizer by working it in near the plant. Always be on the lookout for insects and disease; a little preventive beats losing your crop.

Southern Arizona

By M. E. Bemis

JUNE gardening in the Salt River Valley and in similar locations is largely retrospect and prospect. There should be growing in the garden many things which will require little attention except the harvesting, and those who were fortunate enough and had the foresight to plant in season may now reflect upon their good fortune. June is also a good month to look ahead and make preparations for work which will come later, as the things which may be planted in June are rather few. These would be melons, squash, and pumpkins. Some other things may be planted in the garden, however, if there are vacant places. Grain sorghum of some kinds may be planted and these are worth while as they provide grain which may be fed to the chickens and hogs.

Cowpeas have several uses. The peas, or more properly beans, are edible when in the green state and are relished by many. They make a good grain for hogs and if ground and mixed with other grain are fairly good for poultry. Cowpeas make a splendid hay for milch cows, but its chief use in the Southwest and particularly to the garden is as a soil preparation for other crops. Probably there is nothing that will lighten heavy soil as readily as a crop of cowpeas grown and turned under. Cowpeas are also used to a considerable extent among orchardists and particularly citrus growers, as a summer cover crop.

Mexican June corn may be planted the latter part of the month, although perhaps the first of July is considered a better time for planting. The value of this crop for roasting ears, for grain or for forage cannot be too much emphasized. There is no other variety of corn that will do as well, all things considered, as Mexican June corn.

June is a good time to prepare the ground for fall planting. Stable manure may be spread and plowed under preparing for crops to be planted later.

In July will come the planting of corn and beans, and in August the fall planting takes on greater activity, so that the earlier prepared land is far more valuable for the fall planting. From the standpoint of preparation June is one of the most important months of the year, although, sad to relate, is quite often neglected as such

---

Harry Welch, secretary of the Phoenix Chamber of Commerce, has completed ten years of active work as the executive of that organization. He was recently re-elected secretary and manager for the succeeding year.

June in the Ornamental Garden

Southern California

By Ernest Braunton

THE heavy rains of May will make June, 1921, a spring month. That is, in some ways. A late, cool spring has kept garden vegetation retarded to an unusual degree. Hot weather we have not had; so that during June, with the soil full of rainwater to start with, we shall have a month of unusually fine growth

Under the stimulus of sufficient soil moisture and the long sunny days that always come with June, we must watch carefully over the great amount of soft, succulent growth that will come. It will need both water supply and fertilizers kept above average June provision, and we shall reap a correspondingly rich harvest. At the end of this month gardens should present a more glorious appearance than at any time for years. That is, unless you live in a section of California that did not enjoy record-breaking May rain precipitation.

We will be a little cautious in giving gardening advice for June, because of the new conditions that have arisen quite generally over the state. What will the harvest be? When the hot days come, as we presume they will, try to equalize, in every way possible, the temperature of night and day. The luxuriant growth of foliage will droop sadly if real hot days come. If nights are cool mildew may be very bad. An Australian experiment station says that atomic sulphur at the rate of one pound to 12 gallons of water is far superior in orchard, vineyard or garden, to any other form of sulphur, or any other remedy tried. The next best spray proved to be with three pounds of sulphate of iron, one gallon of lime-sulphur, and 50 gallons of water. This is in orchard quantities, and the lime content would color decorative foliage.

In the writer's garden growth is so late that cannas, ginger lilies and other rooty perennials may still be divided without harm if given abundance of water and shaded for a few days. Dormant dahlia, gladioli and other bulbs may still be placed that would be considered a very late planting in a normal year; but plant at once or not at all. While seeds of the following may be planted now it were better to have plants to set out: ageratum, balsam, annual carnation, cosmos (really a cool weather crop), centaurea, coreopsis (nearly an all year crop), celosia, snapdragon, violet, and zinnia. Cuttings of the latest bloom chrysanthemums should be rooting now, and it is a fine time for geraniums, pelargoniums, or Lady Washington geraniums, and all that class of soft wooded plants to root from cuttings. As "desperate cases need desperate remedies," so does the season's unusual weather bring unusual conditions. As "no man knoweth what a day may bring forth," watch your garden closely that you may be first.

Northern California

By A. R. Gould

WHILE we are almost in midsummer, we have to prepare for the fall display, and such subjects as asters, zinnias, cosmos and chrysanthemums must be planted without delay. Preparations should also be made for the winter flowering sweet peas by getting the trenches ready, trenching deeply with manure. Then it is not too early to study the bulb list to select next season's supply of tulips, hyacinths and daffodils, as the earlier you put in your order the better chance you have of getting the best stock. Climbers such as wistaria, jasmine and roses will need attention, as the long shoots will need tying in. Lilacs and other early flowering shrubs should be pruned back to encourage fresh growth and a good dressing of manure around the roots will help these considerably.

Petunias

These flowers have now been developed to such a size that they are known as Giants of California, and indeed this particular strain of singles in ruffled and fringed is to be had true to name in very delicate shades and may be raised from seed if sown in a box of fine soil placed in a warm position, but your nurseryman can also supply the plants just at this time, and these planted in a bed or border by themselves will give great satisfaction. The fringed double types are also beautiful, and for a solid mass of charming pink color the smaller flowered Rosy Morn will be most effective. Petunias are very suitable for a dry situation and will remain in flower for many months.

Roses

These may be mulched around the roots with well rotted manure. Keep a watch for aphis and destroy with tobacco extract. Mildew may be checked with dry sulphur.

Chrysanthemums

Still time to plant all types of these but it is not necessary to have every known variety in the garden. Secure a few, however, of the best colors in singles, especially the quilled and anemone types, also the pom-poms. The large mop-heads are more difficult to grow and are for the professional to worry over. The amateur gets more blooms per plant from the single and pom-poms and with ordinary care and manure. These are very satisfactory for the perennial border or cut flowers and may be subdivided year after year.

Dahlias

Like the chrysanthemums, there are any number of varieties and still they come, but a few of the best colors in each type, decorative, pom-pom, paeony, show and cactus, should be grown and may be added to year by year. You should lose no time in planting in rich soil.

Fall Flowers—Annuals

Plant out asters, cregos, pink, white and purple; cosmos, crimson, pink and white; zinnias, pink, scarlet and orange; marigolds, African, lemon and orange. Sow gypsophila and Shirley poppy thinly broadcast where they are to flower.

DOES MISSISSIPPI FLOW UPHILL?

"Does the Mississippi River flow uphill?" is frequently the subject of school debates, and such debates usually arise from inaccurate or indefinite uses of the terms "uphill" and "downhill."

In answer to a correspondent who recently made this inquiry, the United States geological survey sent the following reply: Some people describe "down" or "at a lower elevation," when referring to two localities, as the one nearer the center of the earth, and consider the "upper" of the two as the one farther from the center. If only a small area is considered this is practically true, but in referring to widely separated localities, such as the source and the mouth of the Mississippi River, such a definition would lead to an absurdity and must therefore be incorrect.

The surface of water at rest is a level surface, as that phrase is usually understood. Any particle of matter above such a surface will be at a higher elevation, and if acted on by natural forces alone will tend to go down toward the water. Mean sea level is the surface generally accepted as the datum or reference plane for all topographic elevations.

The source of the Mississippi River is about 1,500 feet above mean sea level. Therefore, the unrestrained water at the source of the river, under the action of natural forces, tends to go down to sea level at the river's mouth.

As the equatorial radius of the earth is about 13 miles greater than the polar radius, and as the intermediate radii differ in length between these limits, and as the source of the Mississippi is nearly 19 degrees of latitude farther north than its mouth, it follows that the mouth of the river is about four miles farther from the center of the earth than its source. The combined effect of gravity and centrifugal force makes the water of the river run downhill, although actually the water moves away from the center of the earth in doing so.

AGRICULTURAL LEGISLATIVE COMMITTEE

The Agricultural Legislative Committee held its annual meeting in Sacramento on May 20, to discuss its activities for the coming year.

The program decided upon was to endeavor to secure a closer working relationship between the commodity organizations and the college of agriculture, the state department of agriculture, the U. S. department of agriculture and the farm bureau. It is believed that more effective work can be done by all concerned if closer contacts are made. The officers and executive committee elected for the coming year are as follows: President, C. C. Teague; vice president, Geo. W. Pierce; executive secretary, R. N. Wilson.

Executive Committee

C. C. Teague, Santa Paula; G. W. Pierce, Davis; H. C. Dunlap, San Jose; J. F. Niswander, Fresno; F. G. Stevenot, Carson Hill; G. H. Powell, Los Angeles; F. B. McKevitt, Sacramento.

GRAIN GROWERS CONFERENCES

The U. S. Grain Growers, Inc., is holding conferences with farmer marketing agencies in important grain markets and has held this week a conference at Kansas City. It will hold others at Omaha, June 6-7; St. Paul, June 9-10.

"The object is to get in touch with whatever farmer organizations there are operating on the terminal markets," Mr. Anderson of the sales committee said, "with a view to making arrangements for them to market our grain until we are in position to take them over."

At practically all of the terminal markets there are now farmer organizations that are actively engaged in the cooperative marketing of grain. The report of the committee of seventeen gives assurance that these agencies will not be destroyed at loss to their present owners. For that reason the sales department committee is consulting with the farmers' organizations at each of these terminals before formulating their plans for zone agencies.

Grow Sugar Beet Seed

From present indications the acreage devoted to growing sugar beet seed in the United States this season will be somewhat less than last year. This is due to several causes: First, the drop in the price of sugar has caused several of the sugar companies which grow beet seed to curtail their expenses, and one of their means of curtailment is by eliminating or greatly reducing the production of sugar beet seed. Second, sugar beet seed has become more abundant and more easily obtainable from European countries than it was during the war period and immediately thereafter. Third, while the price of imported sugar beet seed is still from two to three times as high as the pre-war price it is greatly reduced as compared with the price of this commodity during the war. Fourth, the cost of producing American sugar beet seed under normal conditions is higher than the cost of seed imported from European countries.

Reasons for Encouraging Industry

In spite of these changes, which tend to reduce the beet seed acreage in the United States, there are some strong reasons why beet seed growing should be encouraged in this country, department specialists point out. The experience of American growers during the past few years, they say, has demonstrated that sugar beet seed can be produced in this country comparable, in regard to quality, with the imported seed and in some respects, especially with reference to germinating qualities, the American grown seed has generally surpassed the best imported seed.

The importations of sugar beet seed during the past several months have indicated an even lower grade, from the standpoint of germination, than during previous years. In many instances the seed recently imported has scarcely exceeded 50 per cent of germinable seed balls; some of the samples tested even lower, while the American grown seed has maintained its high germinating quality.

It is clear that a seed supply testing but 50 per cent of germinable balls is expensive at 25 cents per pound, as compared with American grown seed testing 80 to 90 per cent germination, even if it cost that sum to produce. Furthermore, some of the samples of imported sugar beet seed have been found to contain a considerable mixture of stock beet seed.

Stock beet seed can not be distinguished from sugar beet seed until the seed is at least germinated, and even then only the colored, red or yellow seedlings indicate the presence of stock beet seed. Some stock beets are white and consequently in the germinating stage can not be distinguished from sugar beets. A considerable mixture of stock beet seed with sugar beet seed renders the entire lot worthless for beet sugar production, for the reason that stock beets contain too low a percentage of sugar to make them profitable for sugar production and consequently can be handled only at a loss.

The only argument, therefore, against the production of sugar beet seed in this country is its cost when compared with that of an equal amount of imported seed. This difference in cost is more imaginary than real, because of the better germinating quality of the American grown seed as well as its freedom from stock beet seed. Furthermore, the cost of production will surely be reduced with longer experience and more highly developed labor saving implements.

Reducing Cost of Production

Formerly the stecklings, or roots from which seed is produced, were all topped by hand in the fall before putting them in storage for the winter. We have now learned that this work can be done just as satisfactorily and at a small fraction of the former cost by the use of an ordinary mowing machine before the roots are taken out of the ground. Another large item of expense in beet seed poduction is the hand harvesting of the seed stalks. It is necessary to perform this operation by hand, mainly for the reason that not all mature plants seed at the same time, making from two to four cuttings necessary.

One of the several objects which the department of agriculture has in mind in its beet seed breeding work is the development of strains of seed beets which will ripen their seed at the same time. When this is accomplished it will be entirely possible to harvest the seed by machinery, and so with other operations employed in producing sugar beet seed, the cost will certainly be reduced and the yield per acre will be increased with improved methods of culture, making the cost of production correspondingly lower.

It is true that adverse weather conditions, pests and other factors will sometimes reduce the yield and quality of sugar beet seed in this country as well as in other beet seed producing countries, just as those factors influence the yield and quality of other crops.

In general, however, the American beet seed growers will have no difficulty in producing high grade seed of especially high germinating quality, and they can see to it that American grown sugar beet seed has not mixed with it stock beet seed or other undesirable seeds or substances.

A supply of high grade sugar beet seed is of prime importance in maintaining and expanding the American beet sugar industry. War time experience demonstrated that if the American beet sugar industry is to be placed on a stable and independent basis a large part of the sugar beet seed supply must be produced in this country.

CONTROLLING COTTON DISEASES

In certain sections of the South cotton diseases are so prevalent and severe that profitable crops cannot be grown by the methods usually employed. There are, however, control measures which can be depended upon to greatly reduce losses from many of the diseases which cause greatest damage. These diseases, with methods of control, are described in Farmers Bulletin 1187, "Cotton Diseases and Their Control," recently issued by the United States department of agriculture.

Wilt, or black root, causes the greatest losses to the cotton crop. Affected plants first wilt and then die. The roots of diseased plants turn black, and from this fact comes the name "black root." The disease is widely distributed throughout the sandy soils of the cotton belt from Virginia to Texas, and spreads each year to new localities. In severe cases the yields are reduced as much as 75 to 90 per cent.

The planting of wilt resistant varieties of cotton, combined with the use of proper rotations, is the only effective method now known of controlling the disease.

The presence of another disease, root knot, in many sandy soils makes the wilt more severe, and it is, therefore, essential that infested lands be planted for one or more years to crops which resist root knot before wilt resistant cotton is grown.

Root-knot is next in importance to wilt from the standpoint of money losses to the cotton crop. It is found chiefly on the same types of soil, but as it is more widespread in its occurrence and as it attacks other crops, it causes a greater loss to farmers. The galls produced on the roots of the cotton plants cause them to become stunted. Root-knot can be controlled by using crop rotations in which root-knot immune crops are planted on diseased fields for two or three years previous to planting cotton. Among such crops are barley, velvet beans, corn, several varieties of cow peas, Bermuda grass, millet, oats, peanuts, rye, sorghum and wheat.

Cotton anthracnose is often more widespread than wilt, since it is known to occur in most of the cotton growing sections. It annually causes losses which range from slight to as high as 80 or 90 per cent of the crop. Losses may be largely reduced by giving careful attention to seed selection and crop rotation. Seed for planting should be secured only from fields free from the disease or be selected from healthy plants at some distance from any which have diseased bolls. Some varieties of cotton seem more resistant to this disease than others.

Bacterial blight, a disease which causes large money losses, attacks the cotton bolls, leaves and stems. The first signs of the disease are dark green, water soaked spots on leaves and bolls which spread and later become dark brown to black. The best method of control is to plant only disease-free seed, and to practice crop rotation.

Shedding, the premature dropping of the squares or young bolls, can be lessened by increasing the supply of humus in the soil and by late shallow cultivation to conserve soil moisture.

Measures recommended for the control of rust are the addition of humus to the soil, the use of potash containing fertilizer, and drainage if the land is wet.

No satisfactory method of controlling Texas root rot is available, but deep fall plowing and crop rotation are recommended as the best known measures for reducing losses from this disease.

MARKETS ARE NUMEROUS FOR BULK GRAIN

Notwithstanding reports to the contrary, the markets for bulk grain seem unusually plentiful this year. The Sperry Flour Company has announced that it prefers to receive wheat in bulk and states that it will be in the market for bulk wheat of the 1921 crop.

The Western Pacific Grain Company of San Francisco has announced that it will be in the market continuously during the coming season for grain to be shipped in bulk to the United Kingdom and other European ports. Other large grain buyers and handlers have made similar statements regarding the subject of handling grain in the same manner as it is handled in the Middle West and East.

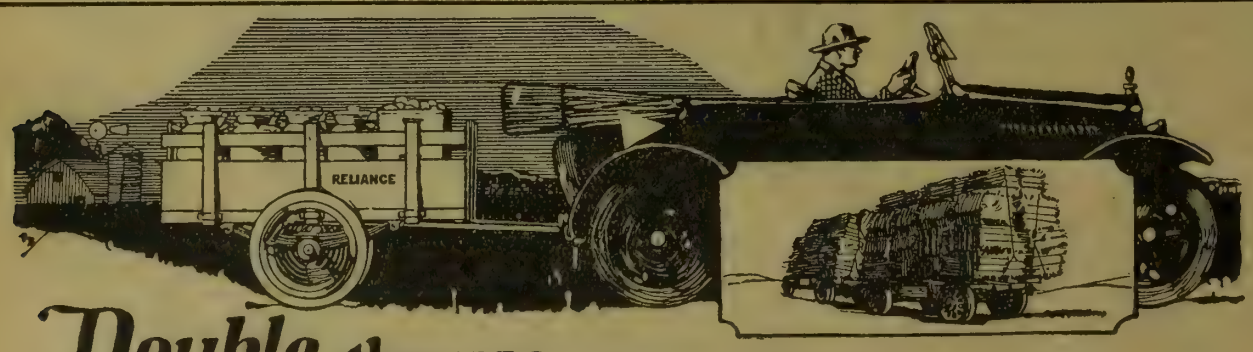
Farmers are cognizant of the fact that 65 per cent of last year's grain crop is still in the warehouses of the state and that there is going to be a shortage in storage room unless they can ship direct to the terminal elevators at Vallejo and Oakland. It is understood that many farmers are installing metal storage bins on their farms and are erecting loading stations on railroad sidings for the purpose of facilitating the handling of their crops.

TAME GOPHER DEMONSTRATES

There's one animal that would be mighty unpopular if he ever left civilization and his free board and keep and went back to his fellows. That's the obliging little pocket gopher that travels with Leo K. Couch, of the bureau of biological survey, United States department of agriculture, who is giving a series of demonstrations on how to trap and poison pocket gophers.

This little renegade, whether because he has no choice in the matter or because he likes the government fare of carrots, potatoes and parsnips, divulges the actual working methods of his kinsmen. When all is set for the demonstration, he is taken from his cage. He sets to work, unabashed by the spectators, and gives a first hand exhibition of how a gopher makes a tunnel. Then he shows how the mound is made and the entrance to it stopped up. His keeper then digs him out, places him back in the cage, and proceeds to his explanation of how to set traps and where to place bait to destroy his mascot's unreformed brethren.

From 25 to 30 retail dealers in the Salt River Valley have pledged themselves to use only Valley dairy products so far as possible. It is believed that there is a sufficient amount of milk, condensed milk, butter and cheese produced locally to supply the demands.



Double the use of your car

Also ask about Reliance four-wheel Trailers

Do you make a practice of carrying small lots of merchandise in your auto? Why not accomplish the same results and relieve tires, springs and upholstery from wear and tear, depreciation and risk of overloading, by the use of a two-wheel trailer built for exactly this purpose?

You can double the use of your car at no extra expense for motive power. You can transport merchandise which perhaps now requires teams or trucks, such as fruit, live stock, etc. You can reach more distant and profitable markets with small quantities of perishable products.

Reliance two-wheel Trailers are scientifically designed for use behind autos and delivery cars. They are properly balanced, pull easily, are built of wrought steel—strong but light—will last a lifetime. Side stake pockets enable the use of any type body, quickly detachable.

Farm Bureau Utilities Work

By Dr. W. H. Walker, President

The state farm bureau is rendering a most helpful service in taking up the farmer's and power user's fight for reasonable and just rates for agricultural power.

The claim is made that California uses more electrical power for agriculture than does all the rest of the United States. Certain it is that the future development of California agriculture depends upon a reasonable cost of electrical power for irrigation.

The various counties have singly and individually appeared before the railway commission, protesting on the various increases asked for by the power companies. The excessive cost of preparing data in these cases has made it impossible for the counties to continue these hearings, and as a result they have asked the state federation to take up their fight.

In working on this case it is found the power companies have based their rate on a capitalization which the federation believes is far too high. The relation of the power companies to subsidiary companies seems to be profitable for these subsidiary companies and expensive to the public service corporations, which increases the rate to the power user. There is a violent clamor against the present 1921 rate, and at a recent meeting in Merced County many farmers stated their monthly bills were practically doubled. Many were cancelling their contracts rather than face the excessive rate, which they stated would bankrupt them.

The investigations have shown that the pumping cost alone on alfalfa will run as high as $5 a ton in many cases. The California farm bureau believes in a fair and reasonable rate, and wants to see electrical power extended, but the life of agriculture in California is at stake and unless a more reasonable rate is established thousands of acres of land will remain idle and thousands more will be undeveloped on account of the excessive cost of power.

At the hearings the case for the agriculture power users is being ably presented for the state farm bureau by Judge Frank S. Brittain. In preparing this case Judge Brittain has the support of the entire state and is employing statisticians and experts to assist in preparing data showing that the rates are excessive and an increase is unwarranted. Each county farm bureau is supporting this state movement, through a public utility committee. This committee realizes that unless speedy action is taken the basis of value will be determined which will govern all future rates.

Now is the time for action and the state federation is leading a sane, sensible, intelligent fight to conserve our argiculture and make California agriculture possible and profitable.

Care in Making Up Crates

IMPORTANT factors affecting the successful use of crates in marketing fruits and vegetables were carefully studied by a specialist of the bureau of markets, United States department of agriculture, during a recent trip through a part of the South, particularly the orange producing region. The first of these is the need of manufacturers making a more rigid inspection of materials used.

While most manufacturers make an effort to have their stock inspected and to use only good material, in some cases this attempt is frustrated by the failure of the workman to understand and appreciate the ideal which is guiding his employer. Many crate mill employes seem to cherish the old idea that because the crate is a gift package it should be made as cheaply as possible, using any sort of material so long as there is a chance of its holding together, thus reducing the cost to the grower and shipper. Under present traffic conditions such a method is the worst one to follow if the best interests of the grower, and therefore of the manufacturer, are to be considered. The manufacturer should endeavor to instill in his employes the importance of culling out inferior and defective material.

Attention should be given also to the work of the automatic nailing machines. These are not invariably accurate, nor is it always possible for the manufacturer to obtain the nails best adapted to successful operation of the machines. Consequently, in nailing panels to head sticks in the manufacture of panel end crates some nails may be missed and inspection is necessary to cull out the defective pieces and put in the missing nails.

Such inspection is a benefit to the individual crate manufacturer, to the crate business as a whole, and to the grower and shipper. If it should involve a slight additional charge to the purchaser it certainly would be a good investment.

Grower's Responsibility

The crate manufacturer having done his part in providing materials free from defects, the grower or shipper should see to it that the crate is not spoiled in being made up in his packing house or field.

Growers and shippers should remember that the nailing together of the crate is one of the biggest factors in determining whether the container is to be strong and substantial or weak and productive of damage claims. Cement coated nails, not less than 4d in size, should always be used, and care should be taken to see that they are properly spaced and placed.

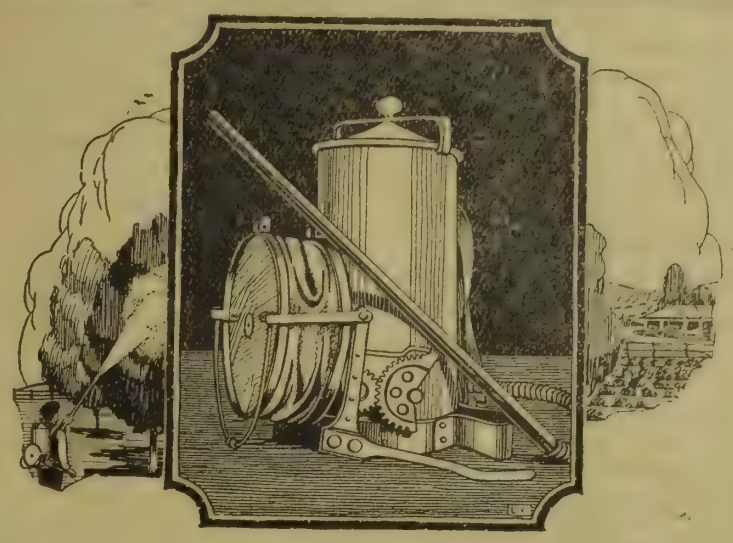
Stricter supervision of the nailers or inspection of their work would seem to be necessary. Some nailers permit their desire for big output on piece work to lead them into making that article so aptly described in the South as a "sorry" crate. In some cases the nail is struck a certain number of blows—the nail may be well driven by these blows or may lack as much as one-eighth inch of being driven in—it is all one to the nailer. In other cases but little attention is paid to the placing of the nails and they either enter the head sticks so near the edges as to split out readily or else miss them entirely. Such carelessness is the cause of much breakage in crates and consequent damage to the contents. Six basket carriers have been observed in express cars in Jacksonville, Florida, with a side loose due to defective nailing.

Greater care is perhaps necessary in making up crates for express shipments than for carlot freight shipments, due to the more frequent handling they must undergo. For either method of shipping consideration should be given to methods of construction which will lessen the possibility of loss. An instance of this is the use of the "web" or cleated side for celery crates. The slats are stapled to the cleats in the factory, making but one piece to each side to handle in the field instead of three. It also insures even spacing of the slats and gives an extra thickness for holding the nails, thus counteracting any tendency of the slats to split and come away from the nails.

Some celery growers are experimenting with a patent crate which is reinforced with wire around the ends and the body of the crate. In actual use the end wires were twisted together to close the package, it being found impracticable, owing to the height of the celery, to twist the center wires together. There is no doubt of the strength of this type of crate.

Need of Cooperation

Whatever the type of crate used it is the duty of the manufacturer to supply good material, accurately cut and properly put together. This much the purchaser of crates should demand and should expect to pay for. Having secured it, he should do his part by seeing that the crates are made up in a workmanlike manner and after packing that they are properly closed and fastened for shipment. By such cooperation manufacturers and growers can feel better assured that the crate will measure up to the ideal of a fruit and vegetable package; that it shall carry the commodity intact from the grower through the wholesale market to the retailer.



Built for Economy

Saves Time. Dusting for the control of orchard or vineyard pests requires dry dust only. No water is needed, no mixing of wet sprays—just lift the top of the tank and pour in the dust. The American Beauty Dust Sprayer is hand-operated and needs no team for hauling nor powerful engine for pumping, Covers 15 acres a day in orchard work.

Saves Material. The American Beauty Dust Sprayer puts dust where it is needed—none is lost in the air nor on the ground. Every blast from the machine penetrates all parts of the infested tree or vine, forcing dust to the center of leaf and blossom clusters.

Costs Less. American Beauty Dust Sprayers cost one-tenth as much as the cheapest power duster. In operation one man does all the work.

The American Beauty Dust Sprayer

Unequalled in the control of Aphis, Thrips, Mildew, Leaf Hopper, Red Spider and other pests. Use "Calispray" Dusts made in our own factory for the American Beauty Dust Sprayer—brands, ready prepared, for insect or fungus pests.

Through dealers or direct from us.

Frosted Potatoes

Have read article in May 14 Cultivator on frosted potatoes. My experience last year was somewhat different and may be of interest.

British Queens planted February 1 froze down to ground April 22 after making tremendous growth of top and having from none to as high as 10 or 12 potatoes set. The potatoes set never grew, but other growers harvested a July crop of 120 sacks from seven-sixteenths of an acre. This year I planted early potatoes in deep trench and filled it full and tramped hard as possible with straw. The straw was a good foot deep but the vines were well above it on April 5 when our killing frost came, and not only did it kill the potatoes set but the tops never came on again. Some of the seed that was not rotted threw out new shoots and I have about half a stand just now coming through ground. One never gets too old to learn.—W. B. Roby, Porterville.

Wire Worms

Will you please give means of exterminating wire worms? Practically our whole crop of Irish potatoes has been ruined by them, and they are now growing very numerous in our garden. They seem to have no favorite, attacking corn, lettuce, carrots and peppers alike. Even our watermelons, which are planted at some distance from the remainder of the garden, have been attacked. No one in this locality seems to know of anything to do for these pests, and unless we can find something soon I am afarid we will have our garden ruined. —Subscriber, Anaheim.

This is one of the most serious pests with which gardeners, potato and bean growers, in fact growers of almost every crop, have to deal. About the only treatment is late summer or early fall plowing which throws the wire worms out to the surface and a good hot day will kill thousands. This treatment will also dry out the soil which causes the death of many. Thorough and clean culture will also aid in starvation. Traps such as cut pieces of potato buried in soil attract many and by carefully lifting out the traps and shaking the pest off into oil or hot water they may be controlled. This calls for a vast amount of patience and time. Thorough sterilization of the soil with live steam is effective but beyond consideration where cost is a factor. A bait which is sometimes recommended but rather expensive is bran, 25 pounds; Paris green, ½ pound; cheap molasses, 1 quart. This is worked into the soil and accomplishes some good.

Peach Trees—Defective Growth

I set out 200 large Elberta peach trees this spring, most of them eight feet high. I cut them back about 30 inches which resulted in many of them not sending out the proper head. Some did not sprout above the bud and one is dead on the top. Would it be best to train a sprout above the bud or let them all grow and try to make a head by pruning? Where there is a good thrifty sprout above the bud I think I can make a tree all right. I have a three year old peach tree that I trained from a sprout. I tie them to the old tree body the same as I would a bud to a stake. Should the twigs and leaves of the sprout be cut off or is it best to wait and prune in the fall? I generally take off all the twigs and leaves from the lower part of the sprout.—Subscriber, Terra Bella.

We think your procedure has been all right. Where a thrifty sprout is out above the bud it may be possible to secure a well balanced top by using it for the main trunk of the tree. It is all right to use the old stub for a stake for a time but we would replace it by mid-summer with another stake. It would be especially well to use care in keeping off all other growth from the old stuff. By all means let the leaves and branches remain on the new growth. Of course where the sprout comes below the bud there is but little question that it would be better to uproot and start with new nursery tree.

Asparagus Healthful

If asparagus is eaten freely is it hard on the kidneys? — Subscriber, Tracy.

We have never heard of a case of injury from eating asparagus. It is diarrhetic and generally considered one of our most healthful and beneficial vegetables. It is possible that excessive eating of it might be harmful but when it commands a price as high as it is this year it is hard to imagine such excessive eating.

Dont Send a Penny

Rubber Boots

For Ranchers and Irrigation Work

$3.98

A wonderful value in Hip or Knee Length Rubber Boots made of REAL gum Rubber with heavily reinforced seams. Made to order of the English Government for the British Army at actual COST OF MORE THAN WE ARE SELLING THEM FOR. Will stand all extremes of heat and cold and made to give extra long wear. Finest quality pure gum rubber with extra heavy soles. This is one of the very finest BARGAINS we have ever been able to offer our customers and the stock is limited so get your order in very early. Nothing better can be worn by ranchers or men who work in irrigated districts, rice fields, etc. This quality of Hip rubber boot would usually cost you $7.50 to $8.00. Remember you can get the full HIP boots for $3.98 or the shorter knee length boots for $3.29. Be sure to mark which kind you want on the coupon below. WE DO NOT WANT YOUR MONEY IN ADVANCE. We take all risk because these boots are such wonderful values. Fill out coupon NOW and mail at once if you want some of these boots before they are sold out.

Send for free catalogue of shoes for men, women, boys, girls and children.

EMIL OLCOVICH SHOE CO., DEPT. 49

225-227-229 South Broadway, Los Angeles, California

Send me.....pairs of Rubber Boots as marked below, postpaid, at once. I will pay postman for them on arrival. If I am not entirely satisfied I will return boots and you will refund my money immediately.

THRESHING—THEN AND NOW

"Once upon a time," as the story teller of old was wont to say, there was an Egyptian prince whose palace near the fertile flats of the Nile overlooked in harvest time many golden acres of golden wheat nodding and swaying in waves with the wind, begging to be harvested and made into meal with the other corns of the valley to grace the table of "my lorde." So any one of a dozen bright mornings would see the slaves of the castle gathering in the sheaves of golden heads, whacking and cutting them from their parent roots with the early forbears of the sickle and scythe. Finally the vast acres were gathered like gleaming jewels into circular piles, each centered on an enclosure of hard ground 50 to 100 feet in diameter, and oxen and sheep were turned into the enclosure and, driven by loud mouthings and whip crackings, milled about the piles, crushing the heads and loosening the kernels from their vaults of husks.

In a little later day the trusty beasts of burden would have been harnessed to a strange looking sledge wagon, known as a charatz, consisting of a frame carrying the driver's chair and mounted on several sometimes spiked rollers which ground out the kernels. The next job of the ancient threshing crew was to throw the straw into the air with forks and let the wheat drop to the ground while the chaff was blown to one side.

The approximate efficiency of such a crew which might thresh several hundred bushels a day, was 50 per cent. How different all this from the modern threshing outfit, separating several thousands of bushels of wheat from chaff each day with a possible and proved efficiency of 99 and 99/100 per cent.

NEW LIGHT ON OUR FOREST QUESTION

In response to a resolution of the United States senate the forest service has restudied the forest situation of the country. It was found that recent high prices of lumber, newsprint, turpentine and other forest products have seriously affected many industries and in various ways have imposed formidable burdens on the public.

House building has been checked, farm development and upkeep hampered, and the cost of furniture, vehicles, tool handles, agricultural implements and other articles heavily increased. Lumber prices have risen out of proportion to increased costs of production and distribution. The pulpwood and paper industry is in straits for raw material from the forests.

Depletion of the timber supplies in the eastern part of the United States has reached the point at which eastern and even southern markets are being entered by West Coast lumber, hitherto barred by the high cost of transportation. The timber of the country as a whole is being used and destroyed four times as fast as new timber is growing, and the saw timber, the most valuable and most needed part of the stand, is being cut five and one-half times as fast as it is produced. More than 80,000,000 acres of land that should be growing timber is unproductive waste, much more is only partially productive, and fires are steadily causing further deterioration.

The new study of the situation made by the forest service contains many facts never before brought out, regarding both individual industries and conditions in individual states and regions. It discusses also the relation between forest depletion and the lumber prices, depletion and exports, and Concentration of Timber Ownership." manufacture and marketing. Fresh light is thrown on the question of timber monopoly.

Finally, a program is outlined for bringing about a fundamental and permanent change in the situation. Timber in large quantities will always be an economic necessity, and we must prepare to grow it. The measures required for this are outlined in full in two forest service publications just issued.

One of these is the complete text of the report on senate resolution 311, and is entitled "Timber Depletion, Lumber Prices, Lumber Exports, and Concentration of Timber Ownership." It is sold, price 25 cents per copy (stamps not accepted), by the Superintendent of Public Documents, Government Printing Office. Washington, D. C.

The second publication is United States Department of Agriculture Circular 112, 16 pages, "Timber Depletion and the Answer." This is a summary of the report and will be sent free, on request, by the United States Department of Agriculture.

MOUNTAIN BEAUTIES FILMED

When Nathaniel Hawthorne wrote his story about "The Great Stone Face" he little thought that the famous "Old Man of the Mountains" would figure as the "male lead" in a motion picture, but that is the case. "The Old Man of the Mountains" is the central figure in a new motion picture produced and issued by the United States department of agriculture.

The picture in which the "old man" stars is known by the title "Under the Great Stone Face." It is one of a series of four in which the beauties of the White Mountain national forest are picturized. The other three pictures are known as "Hitting the High Spots," "Cloud Busting" and "In King Snow's Court." All of them show phases of the work of the forest service in the White Mountains but devote most attention to the recreational opportunities in the White Mountain national forest, which is one of the most popular of the "nation's playgrounds." "In King Snow's Court" was photographed in the winter and is centered around a winter carnival, in which figure ski jumping, Alaskan dog teams, and skaters.

Each of the pictures is one reel in length. The films will be circulated through the distribution system of the department and cooperating state institutions. Copies of any of the pictures may be bought under certain conditions by authorized persons and institutions at the manufacturing cost of approximately $40 a reel.

The Phelps-Dodge Mining Company of Bisbee and Douglas last year purchased $40,000 worth of produce from the Salt River Valley. This indicates something of the possibilities of the markets offered by the mining towns of Arizona. About two-thirds this much was purchased from other farming sections of Arizona. Their purchases amounted to a total of 108 full carloads.

White cauliflower is obtained by tying the leaves over the head, protecting it from the sun. If this protection is not given, the head burns and soon decays.

WESTERN SURFACE IRRIGATION PIPE

Made in one piece with strong riveted seam of full gauge, heavily galvanized steel—insuring durability.

We also manufacture Well Casing, riveted Steel Water Pipe, Tanks, and Corrugated Culverts.

Fresno, Bakersfield, Taft

Tomato Seed Waste Valuable

NEARLY every pulping factory in the country has a small mountain of waste tomato seed. One two-hundredth of every bushel of tomatoes is seed. This doesn't seem very much, or very important either, concerning an item which always has been considered waste; but when every manufacturer of catsup, pulp, soup paste and sauce has several hundred tons of it and scientists unexpectedly discover that two valuable commercial products can be made from it, the world at large is interested. Fixed oil and press cake, or meal, are the latest additions to the products useful to humanity saved by specialists of the United States department of agriculture from huge piles of so-called waste. In the larger factories in the eastern and mid-western tomato belts more than 200,000 tons of tomatoes are pulped annually. The waste seed from these large stations alone totals over 1,000 tons.

Bran Was Once Dumped Into Streams

Men still young can remember when millers were prosecuted for dumping bran into rivers or streams. People declared it poisoned the fish, but science learned that it had a high food value for man or beast, so that the man who threw bran into a stream today would be very likely to land in jail. Tomato seed is just another product saved, like bran, for important uses.

The first important step in making the new products is to separate the seed from the wet waste. Several methods may be used, but it has been found that the most practicable method is to equip the ordinary cyclone pulping machine, now in use in most factories, with a five-mesh woven screen made of No. 12 wire. The mesh is just large enough to admit the passage of the seeds and these flow out of the machine in a continuous stream, while the cores and skins of the fruit are discharged through the gate as usual. The stream of seed and pulp is then pumped into an adjoining cyclone machine having an ordinary 20-mesh breaker screen.

The pulp and juice pass through this mesh but the seed is retained and passes out through the gate. The operation involves no increase of labor and is continuous and efficient. Experience with this method for more than two seasons at the Arlington experimental farm at Washington, D. C., has proved its effectiveness.

Best Grade of Oil Extracted by Pressure

After the seed has been separated from the wet waste it is washed and dried and is then ready for the oil extracting process. Two methods can be used, pressure and solvent extraction. Pressed oil is obtained by mechanical presses and commands a slightly higher price in the market than that extracted by chemical solvent processes.

The tomato seed oil obtained by the expeller process is deep brown and has a strong odor. It is refined, bleached and deodorized by the usual methods and is then comparable in quality with the common edible oils of commerce.

The value of oil cake or meal as stock food has been demonstrated in Italy where the utilization of tomato waste is in practical operation. An analysis of the meal shows the following composition: Moisture, 7.15 per cent; ash, 4.64 per cent; protein, 37 per cent; nitrogen-free extract, 29.1 per cent; and fiber, 22.1 per cent. This analysis gives tomato seed meal a favorable footing with some of the better known seed meals of commerce. It may be used as food for cattle, hogs, or chickens. It has a slightly bitter taste which is masked when mixed with other food.

Owing to the fact that the waste from a single factory would make the profits to be derived from installing a complete manufacturing system hazardous, it would seem advisable to organize a central plant at which all the waste seed from a number of pulping stations could be handled. The specialists who have been studying the process for the department of agriculture suggest the possibility of a cooperative plan of manufacture by an association of canners and packers.

Success in Trapping Small Fur Bearing Animals

By Herbert H. Belford

THERE is at present little demand for the raw fur of most of the common fur bearing animals. In fact, the more reputable houses dealing in raw fur advise their patrons not to trap this season. They claim that there is great danger of ruining the fur market for years to come if a large catch of new fur is added to the stocks now on hand.

The reasons given for this slump in the market after last year's high prices are: an overstock of raw fur in all the markets of the world, and a strike among the employes of the fur manufacturing plants.

In spite of this advice there will doubtless be many people in the country districts who will wish to try their luck during the slack season of the year. For their benefit, therefore, I will give a few hints on the subject.

The first essentials for success are good bait and good traps.

The chief reliance of most trappers I have known for bait is jackrabbit. This is the best all round bait for skunk, wildcat, ring tailed cat, etc. Birds, squirrels, etc., make poor bait, seemingly having no attraction for most animals. For mink, fish is good bait.

While not having had a very wide experience with patent baits and scents I would advise beginners not to use them. From what I have seen and heard of them I think the results obtained from their use will be disappointing.

Good traps are the next essential. By good traps are meant those which are strong enough to hold the animal you wish to catch. For the common animals, skunk, fox, mink, etc., the double spring No. 2 steel trap will be found the most effective. Traps that have been rusted to take off the newness are best. Never grease your traps.

Having secured traps and bait, the next step is to find proper locations for them. For skunk along the tops of the ridges where they come up from the canyons to feed. Other good places are near hollow trees that may be dens or along streams or in runways under fences.

For fox and wildcat, set traps near rock piles in rough, wild country. Trap for mink only along streams having fish in them.

In setting traps, pick out a spot where the limb of a tree or bush comes near enough to the ground so that the bait may be suspended from it. The bait should be hung from the limb by a piece of brown twine. It should be low enough so that the animal will be tempted to try for it and still be high enough so that it cannot be easily reached.

The trap or traps should be placed immediately below the bait, usually only one trap to a "setting" is used. A hole is dug in the earth or leaves big enough and deep enough so that the trap, when set, will be a little below the surface. The springs of the trap should be covered with earth, and then [illegible] or whatever is the natural covering of the ground sprinkled on top. The jaws and pan should be sprinkled lightly with leaves or grass. Care should be taken that nothing gets under the trigger which will prevent it from springing.

The trap may be staked down solidly or may be wired to a small log or piece of brush. If a stake is used, drive it a foot or more into the ground. Use a stake short enough so the top will be near the ground and not easily seen.

In trapping for mink along streams the traps may be sunk in shallow water. In this case the bait should be fastened to the trigger of the trap, so that it will just show above the water. The animal will try to get it with its jaw and be caught.

The traps should be visited every day. Many trappers only visit their traps once a week or so, but this is poor practice, as many animals chew off the foot caught in the trap and are lost.

In conclusion, it might be well to say a word on skinning and preparing the hides for market. Many times poor returns are received on account of carelessness in preparing the fur.

In skinning care should be taken not to cut the hide. Be careful not to leave any more fat on the hide than you can help.

Always stretch the hide as tightly as possible so that it will not shrink in drying. Always split open the tails or they will not cure properly.

When the hides are dry take some blunt implement, such as an old spoon, and scrape all the fat and meat from the hide. Great care must be taken not to tear the skin. After scraping, hang in the sun to bring out the grease. Then scrape again and wipe with a cloth.

PREVENTING FOREST FIRES

Recognizing the value of normal grazing in fire protection of timberlands, a study of its application to national forests, say forest specialists of the United States department of agriculture, suggests:

The timely use of present ranges by the removal of rank vegetation before it becomes unpalatable.

The utilization of all suitable unused grazing lands by the development of water and trails and the elimination or control as rapidly as possible of all factors which prevent present use.

The closer consideration of the class of stock to be grazed where fire protection is involved.

The location of driveways and trails so as to form the most efficient fire lines and means of communication.

The overgrazing of strategic points; minor damage at such points may result in saving large areas of forest from destruction by fire.

The study of lightning fires on the forests with a view to determining whether lightning zones exist and the possibility of utilizing grazing livestock to assist in preventing the spread of fire.

The fuller enlistment of the moral and active support of some 25,000 additional persons in the forests on account of grazing uses.

The closer correlation of the livestock industry of the forests with the fire protection plans.

POTATO IMPROVEMENT

The Utah agricultural experiment station recently issued a bulletin in which was recorded hill selection results in the improvement of potatoes. The work was begun in 1911 and "by 1915 the high yielding strains yielded an average of 301.03 bushels to the acre as compared with 179.30 bushels to the acre for unselected. From 1915 to 1920 the selected strain has outyielded the unselected stock of the same variety by more than a hundred bushels an acre, except in 1919 when there was a difference of only 29.6 bushels. Possibly the extremely unfavorable growing season of 1919 may have caused this wide fluctuation. At any rate, the superiority of the selected strains manifested itself again in 1920, outyielding the unselected strain by 168.6 bushels.

"Not only were the acre yields of selected strains higher than those of unselected stock but there were more tubers to the hill; the individual tubers were larger; and, as a consequence, there was a higher percentage of marketable potatoes than in the unselected stock.

"As a six year average, 1915-1920, the acre yield of the selected strain was 60.9 per cent greater than that of the unselected and the average size of tuber 24.4 per cent greater than that of the unselected. Remnant hills and strains, after the best had been selected out for seed, gave somewhat poorer yields than did unselected stock. The germination of the selected strain is more rapid, the stand is better, the growth thriftier, and diseases less apparent than for the unselected potatoes of the same variety."

Household Department

TWO PICTURES

An old farmhouse with meadows wide
And sweet with clover on each side,
A bright-eyed boy, who looks from out
The door with woodbine wreathed about,
And wishes his one thought all day:
"Oh, if I could but fly away
From this dull spot, the world to see,
How happy, happy, happy,
How happy I should be!"

Amid the city's constant din,
A man who round the world has been,
Who 'mid the tumult and the throng,
Is thinking, thinking, all day long:
"Oh, could I only tread once more
The field path to the farmhouse door,
The old green meadow could I see,
How happy, happy, happy,
How happy I should be!"
—Annie Douglas Robinson.

THERE WAS ONCE A SMALL CHILD

There was once a smal child who would never say please,
I believe, if you even went down on your knees.
But, her arms on the table, would sit at her ease,
And call to her mother in words such as these:
"I want some potatoes!" Give me some peas"
'Hand me the butter!" "Cut me some cheese!"
So the fairies, this very rude daughter to tease,
Once blew her away in a powerful breeze
Over the mountains, and over the seas,
To a valley, where never a dinner she sees,
But down with the ants, the wasps, and the bees;
In the woods she must live until she learns to say please.
—M. S. P., in St. Nicholas.

THE MOST IMPORTANT PRODUCT OF THE FARM

By J. T. Brooks, Department of Agriculture

AGRICULTURE in its broadest sense is the dependence of the human race for its existence. There is nothing connected with it that is not worth while. The improvement of plants, fruits and animals; the improvement of machinery, methods of cultivation and preservation is indeed worth while, the improvement of the soil, the care of livestock, the eradication of diseases of plants and animals are all worth while. But all this is but a means to an end and not an end of itself; the end is the welfare of mankind.

As an ultimate end there is something of far more importance than the reclamation of lands, the production of big crops, the raising of fine animals, the making of machinery, the working of mines, the running of trains and ships, the building of cities. It is the production and culture of young America—the boys and girls.

The farmer should take more pride in his children than in his stock. He ought to see to it that he, his wife and children improve faster than his farm or his domestic animals. What profiteth it him if the course pursued results in rich soil and impoverished minds?

The best products are in the house and they should receive the most care, time and labor. All other labor, though necessary, is incidental as a physical means of operation. The farm and its equipment are for the benefit of the dwellers in the house and not an end themselves.

If the family becomes slaves to the farm and its stock the slavery is unprofitable and the drama is a tragedy. Many a farmer mortgages himself and family to the farm and works for it through life, with no attempt to widen the scope of his own mental horizon nor point his family to other than sordid gain.

The finest fields are those of the household, to neglect them for other fields is to throw away a pearl richer than all lands. Of all the things that the farmer cultivates he and his need cultivation most and are the most susceptible of improvement. On the farm is a good place to dream. Great men have made themselves so by dreaming while at work and at spare time—treasuring up things for many days hence.

The children of the farms who go out to the towns, cities, mines and factories are infinitely of more importance than all other products.

How many fine boys and girls go from the farms into the schools and colleges to become teachers, merchants, lawyers, doctors, clerks, nurses, telegraphers, artists, journalists, authors, lecturers, statesmen, bankers, railroaders, government employes, etc.

The farm has furnished:

Ninety-two per cent of our presidents.

Ninety-one per cent of our governors.

Eighty-three per cent of our cabinet officers.

Eighty per cent of our ministers.

Seventy per cent of our senators.

Sixty-four per cent of our congressmen.

Fifty-five per cent of our railroad presidents.

Men and women are the chief products of the world.

All things else are of importance only as they contribute to the support, comfort and happiness of man. A family of bright children is the greatest possible legacy to leave to the world. A neglected mind is a greater misfortune than a neglected farm.

I'd rather add convolutions to the brain of a student than to reclaim a sea of gullies. I'd rather inspire a noble purpose in young men and women with the quality of perseverance, that leads to accomplishment, than to accumulate a million and die with the scorn of the world as my recompense. I'd rather see a generation of people untrammeled and uncontaminated with the sins of their ancestors than to see every acre of the earth as rich as the valley of the Nile.

He who grows a new idea destined to take a tear from the cheek of unpaid toil or strike a crime from the calendar of law is worth more to the world than he who makes a thousand grains grow where one grew or who accumulates from the toil of others untold millions.

He who forges a new thought at the furnace of intellect that goes ringing down the ages to broaden the minds of coming generations, performs a greater service for mankind than he who lays his hand on the finances of a nation and dictates panics to a hemisphere.

To save the living from being the victims of a moral or physical blight is a sublimer service to render the race than to make a desert blossom as the rose.

The only time that I feel worthy of the proud title of man is when I am willing to work for the happiness of others, who may never know that I ever lived.

WAYS TO COOK LAMB

Pressed Lamb

The meat, either shoulder or leg, should be put to boil in the morning with water just enough to cover it; when tender season with salt and pepper, then keep it over the fire until very tender and the juice nearly boiled out. Remove it from the fire and place in a wooden chopping bowl; season more, if necessary, chop it up like hash. Place it in a breadpan, press out all the juice, and put it in a cool place to harden. The pressing is generally done by placing a dish over the meat and putting a flatiron upon that. It is also good cut up cold in thin slices and the broth left from the meat would make a nice soup served with it, adding vegetables and spices.

Spiced Shoulder of Lamb

Bone a shoulder of lamb, and rub it well with a mixture of two ounces of sugar, one teaspoon each of ground mace and pepper and one saltspoon of powdered cloves. Let it remain in the pickle all day; then roll it up, tie with a string, place in a stewpan with some good stock and cook slowly till done. Lay it on a dish and add a little piquante sauce to the broth and serve.

Curried Lamb Kidneys

Pour one wineglass of rich gravy or brown sauce into a saucepan with one

The Cultivator Patterns

3523. Girl's Dress—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size will require 3¾ yards of 36 inch material for skirt and suspenders, and 1¾ yards for the waist. Price 10 cents.

3512. Ladies' Dress—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 will require 7⅝ yards of 38 inch material. The width of skirt at lower edge is 1¾ yards. Price 10 cents.

3354. Girl's Dress—Cut in 4 sizes: 6, 8, 10 and 12 years. A 12 year size requires 4½ yards of 38 inch material. Price 10 cents.

3497. "Easy to Make" Apron—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A Medium size requires 4⅝ yards of 36 inch material. Price 10 cents.

3128. Boy's Suit—Cut in 4 sizes: 3, 4, 5 and 6 years. For a 3 year size 3 yards of 27 inch material will be required. Price 10 cents.

3518-3513. Ladies' Costume—Waist 3518 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3513 cut in 6 sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. To make this dress in a medium size will require 3⅝ yards of figured material 32 inches wide for skirt, cuffs and vest, and 4 yards of plain material for tunic, sleeves and waist portion. The width of the skirt at the foot is 1¾ yards. TWO separate patterns 10 cents FOR EACH pattern

3501. Child's Dress—Cut in 5 sizes: 1 year, 2, 3, 4 and 5 years. A 2 year size will require 2¾ yards of 27 inch material. Price 10 cents.

3508. Rest Robe in Slip On Style—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-46 inches bust measure. A Medium size will require 6 yards of 27 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

Food and Beverage

Make no mistake! Nothing can take the place of Ghirardelli's Ground Chocolate—at your table or on your dealer's shelves. Because Ghirardelli's fills a daily household need—and fulfills *every* essential of food and beverage.

Ask for Ghirardelli's Ground Chocolate at the store where you do your trading. Never sold in bulk but in cans only. In this way Ghirardelli's retains its flavor and strength—the two most important elements of good chocolate.

Say "Gear-ar-delly"

D. GHIRARDELLI CO.
Since 1852 San Francisco

GHIRARDELLI'S
Ground Chocolate

tablespoon of butter well kneaded with curry powder. Boil until it is fairly thick. Meanwhile, cut two or three onions in rings, fry them over a moderate fire to color slightly, sprinkle over a little salt and drain them. Put a dozen lamb kidneys, skinned and minced very finely, in a frying pan with a little butter and fry them until done. Place them on a strainer to remove all the fat, arrange on a dish, pour the sauce over them and decorate with rings of fried onions and potato croquettes.

Hashed Lamb

Chop an onion and put it into a stewpan with a lump of buter and fry till nicely browned; then mix in a heaped tablespoon of flour and stir in about one-half pint of clear stock, a tablespoon of vinegar, salt and pepper to taste, and a small quantity of mixed spices. Stir the sauce over the fire until it boils, then strain it through a gravy strainer and leave until cold. Cut the cold lamb into thin slices, trim off the skin and most of the fat, put it into a stewpan with a few slices of pickle gherkins, pour in the sauce and heat gradually over a slow fire. When ready turn the hash on to a hot dish, garnish it with slices of toast and serve with mashed potatoes.

Broiled Lamb Cutlets

Trim the cutlets to a nice shape and roll them in butter that has been slightly warmed, sprinkle lightly with salt and pepper on both sides, place them on a gridiron and broil over a clear fire, turning them when done on one side. When broiled arrange them in a circle on a hot dish, pour some thick tomato sauce in the center and serve.

Fried Fillets of Lamb

Cut two pounds of cutlets from the loin of lamb, remove the fat and skin and cut into slices about one-half inch thick; flatten them with a cutlet bat and dip them into beaten egg, and then into sifted bread crumbs. Sprinkle lightly with pepper and salt and let them remain for about one hour. Put some butter in a frying pan and when it is hot put in the fillets and fry on both sides until they are quite done and of a nice brown color. Place them on a dish, garnish with asparagus and serve.

Fried Crumbled Lamb

If thin pieces of lamb, either raw or cooked, are dipped in flour, then in egg, and then in crumbs and fried in deep fat, they lose less moisture than if broiled or pan broiled. This method is especially suitable for rib chops, thin loin chops, or small pieces cut from rare cooked meat. Thick chops would hardly be cooked through by this process.

Ballotin of Lamb

Bone a shoulder of lamb, leaving the end for a handle. Sew it up with a needle, tie it firmly and boil for five minutes. take out and cool, then lard it. Put a slice of bacon in a saucepan with one tablespoon minced onion and one of carrot, brown the lamb with these for five minutes, add a pint of white broth and cook for one hour. The sauce should reduce one-half. Thicken slightly and pour it over one pint boiled green peas and place the shoulder of lamb upon them.

Soup

Four pounds meat from the neck, 3 quarts cold water, 3 carrots, 2 turnips, 1 stalk celery, 2 tablespoons salt, few sprigs parsley, 1 medium sized onion, 3 cloves, 1 sprig thyme, 1 sprig marjoram. Wipe the meat carefully, cut into small pieces and cover with the water. Bring very slowly to the boiling point and skim. Add the vegetables cut into small pieces and other seasoning, and cook slowly for three hours. Strain, cool and remove fat. Serve either clear, with rice, or with vegetables finely chopped.

Scrambled Lamb

Take three cups of cold lamb chopped fine, three tablespoons of hot water, and piece of butter size of an egg; place on stove, and when hot, break in three eggs, and constantly stir until the eggs begin to stiffen. Salt and pepper to taste and serve hot.

Scalloped Lamb

Place layer of bread crumbs over bottom of earthen baking dish, and over this alternate layers of cold roast lamb cut in thin slices, together with ripe tomatoes peeled and sliced; season each layer with salt, pepper and bits of butter. Top layer should be of tomatoes, spread over with bread crumbs. Bake three-quarters of an hour and serve at once.

LEMON SPONGE PIE

Three tablespoons butter, 1½ cups sugar, 3 egg yolks beaten until creamy, 1 lemon (juice and grated rind), 1 orange (juice and grated rind), 3 tablespoons flour, 1½ cups milk, 3 egg whites, beaten dry. Beat sugar to a cream; add ½ cup of sugar. Add remaining sugar to beaten yolks; add orange and lemon juice and combine mixtures. Mix flour with ½ cup of milk, add to first mixture, then remaining milk and carefully fold in the beaten whites. Put into a pastry lined pan and bake from 30 to 40 minutes.

SQUASH PIE

One and a half cups cooked, strained pumpkin or squash, 1½ cups rich milk scalded, 1 cup brown sugar, 2 eggs, ¼ teaspoon salt, ¼ teaspoon nutmeg, 1 teaspon ginger. Mix all ingredients; have a deep pan lined with pastry, pour in the pumpkin mixture and bake in a medium hot oven until firm. May be served plain or with whipped cream.

And now we have prune mincemeat. That is, in making mincemeat, the housekeeper may use prunes instead of raisins. J. O. Holt, manager of the packing department of the Oregon Growers Cooperative Association, announces that mincemeat with prunes instead of raisins is now being made at the Eugene plant and has already been placed on the market.

STIRRING WORDS

"Ah," sighed the tolerably young and more or less fair maiden, "are there any words in the language which stir the emotions like the simple little phrase, 'I love you'?"

"Oh, I don't know," the youth replied a bit nervously. "I feel very pleasantly stirred by the words, 'Dinner is ready'."

A man is as cruel as the things he permits. Not to protest a crime and oppose it is to condone it.

TAKE YOUR CHOICE

This is a day of cooperation.

If you want to ride in the band wagon get in and cooperate.

If you want to follow the hearse, let every man act for himself and refuse to sign.—O. J. Woodward, President First National Bank, Fresno.

WOULD I WERE A ROCK

I wish I were a little rock,
A settin' on the hill,
A doin' nothin' all day long,
But just a settin' still.
I wouldn't sleep,
I wouldn't eat,
I wouldn't even wash—
I'd just sit still
A thousand years
And rest myself,
By gosh! —Ex.

HERE'S A TWR

She frowned on him
And called him Mr.
Because in fun
He merely Kr.
So out of spite
The next good night
The naughty Mr. Kr. Sr.

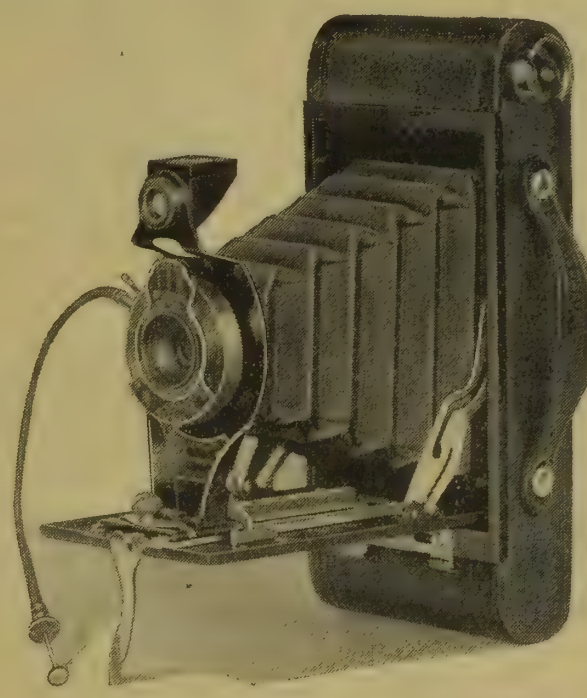
You men who are planning on building new homes should remember to let your wives help in the planning. They are the ones who have to live in them and it is they who have to care for them after they are completed.

It is Kodak Made.

The No. 2A Folding BROWNIE

$10.00



Honest workmanship has become a habit in the Kodak factories, and it is in those factories, in the skilled hands of Kodak workmen and under Kodak superintendence, that the Brownie cameras are made.

The 2A Folding Brownie gives a happy combination of real convenience and efficiency with genuine economy. The pictures are 2½ x 4¼ inches, a really satisfactory size, yet not so large as to make the film and printing costs high. The folding feature makes it convenient to carry; the excellent finish is both durable and pleasing.

The Kodak Ball Bearing shutter, with which this camera is fitted, is quiet and certain in action. It has snap-shot speeds of 1/25, 1/50 and 1/100 of a second and the usual "time" features.

The Meniscus Achromatic lens is of excellent quality and each one is carefully tested.

Like all Kodaks and Folding Brownies, the No. 2A is autographic—provides the means for dating and titling the negatives at the time the exposure is made. This camera has two tripod sockets, a finder and an accurate focusing scale.

The price, ten dollars, includes the excise war tax and the films are but thirty cents for six exposures. Picture taking with a Brownie camera is very simple and is less expensive than you think.

Catalogue of Kodaks and Brownies free at your dealer's or by mail.

EASTMAN KODAK COMPANY, ROCHESTER, N. Y., *The Kodak City*

Single Stalk Method

Twenty-five to 100 per cent increase in yield is reported by cotton growers who have adopted the new close spacing system of cotton culture, introduced eight or ten years ago by the United States department of agriculture. Reports coming directly to the department and to southern agricultural journals, which have interested themselves in encouraging the new system, show that farmers throughout the cotton regions of the country are rapidly turning to the plan. Increased yield, less labor and expense for the same crop, and a lessening of boll weevil damage are among the benefits recited in hundreds of letters written by farmers in various parts of the South. Indications are that the system will be adopted far more widely the coming season.

Space Plants a Hoe Width Apart

The close spacing, more commonly known as the single stalk method of cotton culture, consists primarily in spacing the cotton plants so close in the row—a hoe width apart—that the lower or vegetative branches do not develop, and the growth of the plant goes directly into the upper or fruiting branches, permitting them to begin the development of blossoms and bolls earlier and giving them more nourishment and more light.

The discovery that the cotton plant, in common with coffee, cacao, and a number of other species, produces two different sets of branches was announced by specialists of the department about 1911, and has given direction to a series of useful experiments in cultivation. By taking account of the specialized habits of branching it was found possible to exercise a much more effective control of the development of the plants so as to secure earlier crops, larger yields, and greater protection against injury by the boll weevil.

The suppression of the vegetative branches avoids the excessive crowding of large plants and injurious competition between the two kinds of branches. The cultural ideal under the new system is a cotton plant with only the single, erect, central stalk bearing numerous well developed fruiting branches, but none of the vegetative branches or secondary stalks. The suppression of the vegetative branches is easily accomplished by leaving the young plants close together in the rows. Thinning is deferred until the plants are some six to eight inches high, or even later under conditions of rank growth. If the young plants stand less than six inches during these early stages of growth, more of them will not produce many vegetative branches, but will have only the upright central stalk and the horizontal fruiting branches.

The distance between the plants is regulated with reference to local conditions and the habit of growth of different varieties, the range being between six and 12 inches. The plants then have a narrow upright form and can be left closer together in the rows. Even with the plants only three or four inches apart in the rows there may be less injurious crowding than with large many stalked plants three feet apart in the rows. The distance between the rows, usually three and one-half feet, can also be varied with reference to local conditions, but crowding the rows together, so that the sun does not reach the ground, is undesirable especially under weevil conditions.

Small Plants May Outyield Large Ones

In the way of production two distinct advantages are gained. The smaller single stalk plants, free from any large unproductive offshoots, proceed at once to the development of the branches which produce cotton bolls, and in many cases these small plants produce almost as many bolls and a better quality of lint than large many stalked plants occupying the space of three of the smaller. But even with very small plants that bear only a few bolls apiece the yields may be much larger than from large spreading plants. The bolls also are produced much earlier on the small plants, and are more likely to escape injury by the boll weevil.

The Egyptian cotton industry of the Southwest, an achievement of the department of agriculture which has added $20,000,000 a year to the annual agricultural income of the country, could not have been acomplished, in the opinion of department specialists, without the new close spacing system for controlling the vegetative branches. The benefits to the $2,000,000,000 cotton crop of the country at large, with continued extension of the new method, can only be faintly estimated.

Citrospray *versus* Fumigation

After a careful inspection of orchards sprayed with Citrospray for Citrocola Scale one of the oldest and largest growers in Southern California writes:

"In looking over the orchards that have been sprayed with Citrospray will say that I found it very satisfactory.

"Comparing it with adjoining orchards, which were fumigated, will say that the sprayed orchards showed just as good as they did."

This grower will use Citrospray on several hundred acres this year as a result of his investigations.

The cost of spraying with Citrospray is about 50% of the cost of fumigating.

What are you going to do, Mr. Reader?

Grow More Food

Increased transportation costs and lessened returns from the products they have to sell will compel thousands of American farmers to grow more of their own food. These transportation costs will prevent shipments of the more moderate priced fresh fruits and vegetables which are purchased by the growers of single crops or specialties for use in their own homes, and the lack of a market for special products in turn will be a blow to the buying capacity of the growers of those specialties.

The American farmer is not going to be able this year to pay freight on water. Water makes up a large part of fresh fruits and vegetables. The answer is that he must grow his own table fruits. He must also study the possibilities of substitution. This applies to vegetables, fruits, poultry, eggs and dairy products which must be transferred from commercial channels to home consumption if they are to come within the reach of the average farmer's family.

Specialized farming has created conditions of which comparatively few persons are aware. The grain farmer in many instances buys even his potatoes and green vegetables; the fruit farmer buys his dairy products; and even the man who raises milk for creamery, condensary, or cheese factory is likely to send his cream or milk away, feed the skim milk or whey to the calves, and not make his own butter. This year, just as far as possible for him to alter his system in a single season, it is advisable that he get back to the old plan which was aptly described as "living at home." This means not so much remaining on the farm as it does deriving every practicable product for consumption from the farm. The following is from the department of agriculture:

"The average American farmer knows how to raise other crops than those on which he specializes, but it has seemed good business, or at least expedient, to devote his energies to very few or even a single cash crop and buy his necessities, just as is done in other specialized industries. The grain farmer is perfectly capable of raising his own potatoes, his green garden stuff, and melons, tomatoes and other garden fruits to take the place of orchard fruits which in many parts of the country have been killed by the late freezes. If the farmer has a piece of really good garden ground he can add materially to the variety and wholesomeness of the farm food supply with scarcely any expenditure except for seeds, and seeds, fortunately, are lower this spring than for several years.

"The same may be said of poultry. With increased freight rates this year the general farmer's principal meat supply will come out of his poultry yard, either in eggs or in table chickens and other fowls. Poultry is the quickest meat supply to produce, and the farmer will do well to build up a small flock as rapidly as possible. The increased freight rates on butter and eggs, together with the farm money shortage due to the disappointing returns from last year's crops, will make it advisable for many farmers' wives to return to the butter making arts which they learned as girls from their mothers and which have been largely discontinued as farmers became specialists.

"Fruit is likely to be scarce in large and important farming regions, but its place can largely be taken by vegetable products. Two things are clear. In the first place, the average farmer, as it stands now, cannot afford to pay freight on the water which makes up the larger part of both fresh and canned vegetables and fruits. In the second place, under existing conditions, he can raise those things cheaper himself than he can buy them, and he can make many substitutes out of the garden and poultry yard if he sets out to do it. He has the material for the crops and he has not the money. It is not good business to run in debt except for essentials of production."

Safety Valve for Farm Lease Contracts

AN engineer doesn't have to see a boiler explosion to know what may happen if he ties his safety valve down. A glance at the variations in the market price of farm produce for the last year ought to warn the tenant farmer and his landlord as to what may happen to their business if they tie themselves down to a rigid farm lease contract and in order to avoid serious friction and misunderstanding between landlord and tenant it is important to provide the lease contract with a clause that will adjust the rent to the market value of the produce grown on the farm. Before putting his name on the dotted line the farmer, and his landlord, too, should look over the stock of financial safety valves offered.

If the landlord is willing to accept the responsibility of marketing his share of the farm produce the lease may be drawn on the share rent basis. By its provisions the rent is paid in so many pounds of cotton, so many bushels of corn or wheat, or other produce, for each acre rented. In other words, the landlord receives his rent in a certain percentage of the crop and without relation to what the market price of the product may be. The rent is settled in terms of bushels and pounds rather than in dollars. Profits or losses from price fluctuations are shared under this system. If, however, the landlord cannot accept his rent in produce, or if any other reason makes it advisable that the rent be paid in cash, the compensating device may be applied by means of a sliding scale amendment. For example, a rent of $9 an acre might be rebated to $7 if the price of main crop fell 20 cents a unit, or raised to $11 if the price went up 20 cents above the basic price agreed upon. If a very fine adjustment is sought, a percentage system can be used in this scale so that the rent is changed by as many per cent as the price of the crop has risen or fallen between the date of the contract and the date of settlement.

Subject to Modifications

Both systems are subject to many modifications which may be invoked to care for special cases. The strong feature in such lease contracts lies in the fact that both parties are protected from loss incurred by a change in prices which neither can foresee. A rigid contract which contains no allowance for market rise or fall does not offer protection to either individual; one will gather an excess profit at the other's expense if there is any abrupt change in the market price for the produce. By providing the contract with a relief clause, the landlord and tenant unite to play the game together rather than against one another, as under the rigid type of contract.

In any sliding scale amendment there should be specific understanding uopn the following points:

The areas to be under the provisions of the scale. Areas not in crops, and areas in soil improvement crops may be kept on a non-scale basis, or, if cash rents have been written up on such land at high prices, the scale may be made to cover them all.

The products involved: It is better to take a single important crop as the standard than the average of two or more crops.

The grade and quality of the product upon which the change of price is to be determined.

The market: It is often advisable to name the dealer whose quoted price is to be used in making the adjustments.

The day or the period for which the quotation will be taken. Sometimes the average between the high and low price of a certain month is used.

But even after the flexibility of the farm lease contract has been attended to there will still be need for an attitude of liberality in landlord-tenant

relations. To help reduce costs, to secure opportune markets, and to adapt equipment and methods to new production demands there is nothing which is so effective as generous cooperation.

Farmers Bulletin 1164 tells about the various standard forms of lease now in general use.

GREAT RANCH SOLD

The celebrated Elwood Ranch near Santa Barbara, one of California's show places, was successfully sold at the auction held last week according to announcement made in the Cultivator of May 7. This great ranch was for many years the property of Elwood Cooper and on it was erected the oldest olive mill in the state. The property was sold by Mr. Cooper to Major C. M. Crichton and F. H. Greene nearly a dozen years ago. Major Crichton gave up his life in the great world war and Mr. Greene died during the past year. The widows, unable to keep up the work of the great ranch, offered it at public auction. The purchasers were J. E. Doty and Joseph Archampault, both retired farmers. The price was $225,000. The auctioneers were W. H. O'Connor and Sons of Los Angeles, who inform us that this price represents the largest value ever bid at an auction in California for a single parcel of land. The livestock and equipment of the ranch were not included in the sale, but it is understood that the 75 draft horses, 300 cattle, 300 hogs, implements and general equipment will be sold at a later date.

The maanger of the ranch for many years has been "Farmer" Graham. Mr. Graham came from Scotland to take charge of this property at the request of the former owners. The presence of Farmer Graham and his family with their Scotch burr and their thrifty and hospitable ways made a visit to Elwood a rare pleasure, and the highest compliment which Mr. and Mrs. Greene could pay their visiting friends was to motor them out to Elwood for luncheon.

"MEET 'EM HEAD ON"

Theodore Roosevelt Jr., "son of his father," counseled in a political fight to "meet 'em head on." He would neither run from a fight, lie down, nor dodge an issue. To win a fight is to hit first and hit hard; to overcome temptation, squash the impulse and don't dally with it; to get over trouble, wade straight through it.

War time "passing the buck," the habit of everlasting dodging, evasion, shuffling and deceit, has made the world sick with disgust at incessant delays. These things held back and hampered decisions, tied up situations in snarls of red tape, bungled bureaucracy and hamstrung action.

Get things done, make decisions, place authority, look men in the eye and cut out camouflage, circumlocution and crawling. Give decisions with the speed, surety and snap of a baseball umpire.

Hard thing to do that, but the men who can say "yes" or "no," and say it right and quick, eight times out of ten hold the big jobs, get the big pay and produce big results. This habit of decision comes from clear thinking, positive convictions and courage. It is not easy; but in the long run it is easier than evasion.

Somebody writes of the burdens and exhaustion of his job, of being overworked and worried and driven. The man is a secretary and doing it all himself; but his job is not so big as he thinks it is, nor is he as big as his job and big enough to "meet 'em head on."

PURE BRED LIVESTOCK FIGURES FOR CALIFORNIA ARE GIVEN OUT

The census of livestock in California, together with the pure bred stock reports, was issued this week by the Bureau of the Census. The report shows there are nearly 10,000 farms with pure bred livestock, with a total of 1,615 pure bred horses, 32,388 pure bred cattle, 28,831 pure bred sheep, and 35,741 pure bred hogs.

The figures show the Percheron to be the most popular horse; the Hereford to be in the lead among beef cattle; the Holstein to lead the dairy animals; the Rambouillet the leader in number of sheep, and the Shropshire in first place as to number of breeders; and the Duroc-Jersey leading in number of hogs.

The Census Report

The census report follows:

Breed—	Farms reporting—Total	Farms reporting—Males	Farms reporting—Females	No. of pure-bred animals reported—Total	No. of pure-bred animals reported—Males	No. of pure-bred animals reported—Females

The best thing a father taught his son was to meet an issue and to meet a man straight visioned, squarely, and neither to lie nor lie down; to be a gentleman, and at the same time not grovel and crawl; to be fair spoken and not flabby willed; to be fearless and to consider the other man's right to be thought just, and not quail nor waver in his judgment, nor to dodge an issue.

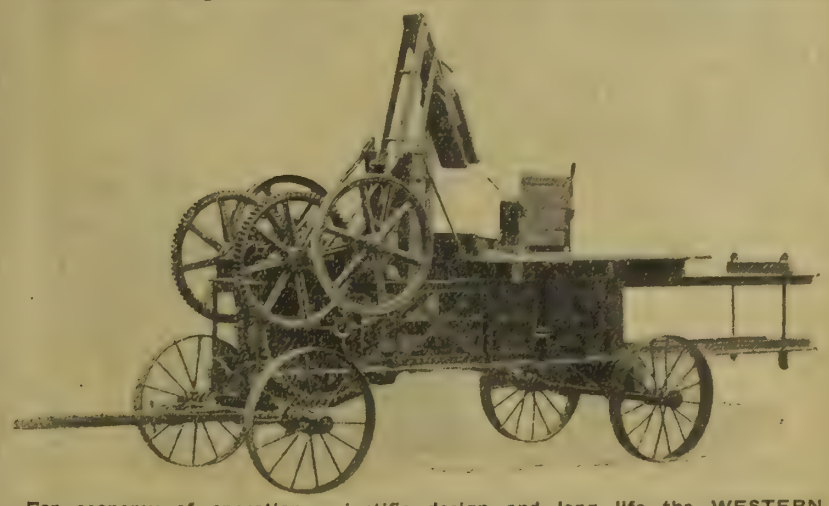
Practice the habit for a day of meeting situations "head on." It will mean more work done, better satisfaction in doing it, and will save the other man the exasperation, delay and despair from the contemptible habit of "passing the buck" and evading responsibility.—Association Men.

CITRUS INSTITUTE

Plans for the coming summer session of the Citrus Institute to be held June 24 at Whittier are not yet completed, but those already made indicate the program will be a practical one. In the face of such adverse conditions as now exist, citrus growers cannot afford to miss this institute, for it behooves every grower to cut the cost of production in every possible way. Obtaining ideas from experienced men is one of the best ways of finding out how to cut the cost of production.

WESTERN SPECIAL POWER BALER $950

The latest improved biggest value power baler on the market



For economy of operation, scientific design and long life the WESTERN SPECIAL has no equal. It has automatic block dropper, double back gears, a feature that doubles the compression without extra power, takes off the jerk—makes uniform pull on engine,—three dogs, tying chamber 1 to 2½ feet longer than others, double side gears, quick return, self feed. Repair bills almost nothing. Parts in stock. Terms if desired.

COMBINATION SALE
BURR FARM——AGEE BROS

60---REGISTERED HOLSTEINS---60

GUARANTEED BREEDERS—TUBERCULIN TESTED
SOLD ON MOST LIBERAL TERMS

Thursday, June 9, at 10 A.M.
at Burr Farm, Los Angeles, Cal.

Most of the offering is made up of fresh and heavy producing young cows, with a few heifers well along with calf, and only two or three open heifers. The females include:

A 27 POUND JUNIOR 3 YEAR OLD daughter of It, out of a 27 lb. 3 year old daughter of the century sire Changeling Butter Boy. Now fresh and on yearly test.

A 27 POUND granddaughter of Johanna McKinley Segis, now on yearly test and bred to King Korndyke Pontiac 20th.

A 26 POUND COW that milked 711 lbs. in 7 days. Now on yearly test and bred to King Pontiac Tola Ormsby.

A 25 POUND COW, now on yearly test and bred to King Pontiac Tola Ormsby.

TEN OTHERS with records above 20 lbs. butter in 7 days, and several with yearly records up to over 740 lbs. butter.

MANY OF THESE CHOICE FEMALES are in calf to King Korndyke Pontiac 20th, Sir Veeman Korndyke Pontiac, King Pontiac Tola Ormsby, Toyon Fayne Valdessa, or Sir Manuel Hengerveld, each of which is out of a 30 to 36 lb. dam or a dam that made over 1,000 lbs. butter in one year, or both.

EIGHT YOUNG BULLS IN THE OFFERING

Four of these are sired by Toyon Fayne Valdessa, every one out of an official record dam, one each by Sir Veeman Korndyke Pontiac, Segis Pontiac Abbekerk, Sir Veeman Helena Korndyke, and King Pearl Segis Pontiac, out of high class dams.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

TERMS OF SALE: One-third cash, balance in twelve equal monthly payments with approved note and livestock insurance on deferred payments, but arrangements for credit must positively be made before sale, otherwise terms are cash.

Margarine Tinkering

N. P. Hull, President of the National Dairy Union, is taking up the fight on the margarine interests which are endeavoring to force through legislation antagonistic to the dairy industry. President Hull writes:

"I am compelled to refer again to the continued efforts of the Institute of Independent Margarine Manufacturers, through its officers, to atack the dairy industry. An article, giving evidence of careful preparation, appears in the current issue of the American Food Journal, which evidently is designed for this purpose. This article is a very careful statement, quoting only the highest scientific authorities in an effort to prove that perhaps oleomargarine sometimes does contain vitamines and that butter is sometimes more deficient in vitamines than at other times. With all the skill of a special pleader, its author carefully selects just the statements which he needs to prove his case and makes a very clever use of these statements. By careful selection of a statement here and a statement there from the reports of research work by such authorities as Osborne and Mendel, Steenbock and Boutwell, Katherine Blunt and Chi Che Wang, he finally comes to this conclusion, selfevidently the animus of the entire article: White butter artificially colored is therefore adulterated butter.

"It will take more than the statement of a representative of the oleomargarine industry to convince the public that there is generally speaking any such a thing as white butter or butter which does not contain sufficient vitamines to serve the protective purposes which have made it the highest type of human food. Even the savages of central Africa know this. The New York Tribune of May 1 says that a remarkable East African journey has just been completed by Rev. John Roscoe of Thetford, Norfolk, England. Mr. Roscoe traveled many thousands of miles in the interior on foot and by bicycle, using native paths. He found tribes who lived wholly on milk and nothing else whatever unless a cow died, and after feeding on that a twelve hours fast was imposed. So vast were their cattle herds that a king regarded 20,000 as a small flock. This is the only foodstuff that is capable of being used as the only food of a race of people and supply them all the essentials for life, health and proper growth.

"The argument, however, made by a representative of the oleomargarine industry that coloring white butter is an adulteration, has another reaction which he himself could not have recognized or he would not have ventured on this ground. The facts are that oleomargarine, especially the vegetable margarines, are white and it does not require any exhaustive search of the results of technical research to prove this statement. It is also a fact that they are to a high degree, if not completely, deficient in vitamines. The use of color, therefore, is clearly an effort to conceal this inferiority by making the public think that oleomargarine is the same as or as good as butter, and instead of being licensed and permitted by law, this coloring should be absolutely prohibited, as it is in similar cases with other foodstuffs. It is not too far to go to say that the same argument and reasoning would prevent the use of milk or any dairy product to be mixed with oleomargarine, for this is done to make oleomargarine taste like butter and thereby conceal inferiority.

"This is the argument which the dairy people have advanced ever since oleomargarine was first exploited in unfair competition with dairy products. It is perhaps the first time, however, that a paid representative of the oleomargarine interests has ever made the argument for the dairy people."

High Quality, Moderate Prices in Caledonia Shorthorn Sale

The third public sale of Shorthorns from the Caledonia Farms herd was held at the farms, West Sacramento, Wednesday, May 25. Forty females averaged $278 and ten young bulls averaged $251—a general average on the entire offering of $275 being established. While such an average must be considered very conservative in view of the quality of the Caledonia herd, it was generally felt that the sale indicated a much stronger tone than has been manifested in eastern sales, and the fact that practically the entire offering was absorbed by men new in the business is regarded as a demonstration that there is a growing demand for good Shorthorns in California — a demand that will require years to fill.

The offering included a fair number of Scotch females and bulls and all the females either sold with calves at foot or bred to one or another of the Caledonia herd bulls, Imp. Caledonia, Pine Grove King and Gainford Matchless. The records the above bulls are making as sires of the correct stamp of calves was cause for much favorable comment and furnished the incentive for the buyers.

The top of the sale was reached with the outstanding white cow, Fayette Countess 2d, that sold with a cracking good roan bull calf at foot by Gainford Matchless to Geo. J. Meister of Sacramento for $600. This cow was easily worth double the price paid as was the red Lavender Venus that fell to the bid of Senator B. F. Rush for $450. Easton and Ward, owners of the Blackhawk Ranch, Diablo, secured some of the real bargains of the sale in the four richly bred females credited to them in the sale list.

No high prices were recorded for any of the ten bulls. R. L. Creps of Wheatland probably got the best bargain in the Roan Lady calf, Aberdeen Archer 2d. P. B. Cross of Willows made an excellent selection in the red Sultan's Marvel 16th.

In the distribution of such acceptable cattle and in the high class manner of selling, Caledonia Farms rendered the Shorthorn cause a valuable service in this state.

The sale was held under the management of C. L. Hughes of the California Breeders Sales and Pedigree Company. Col. Rhoades occupied his customary place on the box and was ably assisted by Col. John A. Davis in the ring.

A representative list of sales follows:

1, Lavender Venus, red, Sept. 1916 and Mar. 1921 C.C.; B. F. Rush, Suisun, $450.
2, Blossom Duchess, red and white, Feb. 1918; Geo. Meister, Sacramento, $300.
4, Souvenir Queen, red, Jan. 1919; P. B. Cross, Willows, $290.
6, Fayette Countess 2d, white, Feb. 1915 and B.C.; Geo. Meister, $600.
7, Choice Flower, red, May 1919; Easton and Ward, Diablo, $300.
8, Purity of Paicines, red, May 1910; F. L. Gordon, Suisun, $225.
9, Princess Lavender 3d, red and white, Dec. 1914 and B.C.; R. E. Burton, Vacaville, $400.
10, Pine Grove's Hope, red, Oct. 1918; Easton and Ward, $335.
11, Lavenderess, roan, Oct. 1916 and B. C.; R. S. Seydel, Lincoln, $285.
13, Ury Princess, red, July 1919; Easton and Ward, $275.
14, Bapton Countess, white, Jan. 1918; Geo. J. Meister, $225.
15, Sultan's Mistress, roan, Sept. 1918; Easton and Ward, $300.
16, Scottish Princess 2d, roan, Dec. 1919; C. A. Slack, Tracy, $205.
17, Paicines Maid, red, Mar. 1918; C. A. Slack, $275.
18, Butterfly Caledonia, red, Sept. 1919; P. B. Cross, $225.
19, Pine Grove Princess 3d, red, May 1916; C. Harold Hopkins, Davis, $300.
20, Glenbrook's Memory 40th, red, May 1915 and B.C.; R. V. Traynham, College City, $300.
21, Glenbrook's Memory 14th, roan, April 1913; Geo. J. Meister, $350.
22, King's Memory 8th, roan, Jan. 1914 and C.C.; F. L. Gordon, $225.
23, Glenbrook's Memory 7th, roan, Mar. 1913; T. S. Glide, Davis, $350.
24, Girl's Fancy, roan, Jan. 1911 and C.C.; Howard Vaughn, Dixon, $325.
25, King's Memory 18th, red, Dec. 1914 and C.C.; R. V. Traynham, $385.
26, Princess Lavender 2d, red, Nov. 1914 and C.C.; G. A. Slack, $340.
27, Glenbrook Nanon, red, May 1912; B. F. Rush, $325.
28, King's Memory 9th, roan, Jan. 1914,

and B. C.; Wm. McGrath, Watsonville, $275.

29, Glenbrook's Memory 10th, roan, Mar. 1913, and B. C.; Geo. M. Haight, Montague, $285.

31, College Memory 2d, roan, Oct. 1917; C. P. Mauser, Porterville, $260.

32, Champion's Maid, roan, Oct. 1917 and C. C.; Geo. M. Haight, $250.

33, Glenbrook's Memory 27th, red, May 1914, and B. C.; Wm. McGrath, $275.

34, Whitehall Mirth, roan, Feb. 1910; Howard Vaughn, $275.

35, King's Memory 17th, red, May 1914 and B. C.; R. J. Coonrod, Montague, $225.

36, Little Countess, red, Sept. 1914, C. P. Mauser, $210.

38, Grenadine 2d, roan, Jan. 1920; Newhall Land and Farming Co., $200.

39, Glenbrook's Memory 41st, red, Nov. 1919; Newhall Land and Farming Co., $215.

40, King's Viscountess, red, Sept. 1919; P. B. Cross, $230.

BULLS

43, San Benito King 7th, white, Jan. 1920; E. A. Briggs, Healdsburg, $220.

44, Sultan's Marvel 16th, red, Jan. 1920; P. B. Cross, $310.

45, Aberdeen Archer 2d, roan, Mar. 1920; R. L. Creps, Wheatland, $335.

46, San Benito King 8th, roan, Feb. 1920; E. A. Briggs, $255.

47, Champion Jr. 10th, roan, Jan. 1920; R. J. Coonrod, $250.

49, Sultan's Marvel 15th, red, Jan. 1920; R. J. Coonrod, $200.

50, Pine Grove King 22d, roan, Jan. 1920; Gardner Pierce, Davis, $290.

51, Sultan's Marvel 7th, roan, Jan. 1919; L. E. Middleton, Wheatland, $220.

52, Sultan's Marvel 10th, red, Feb. 1919; Wm. McGrath, $240.

VAUGHN SHORTHORNS AT BARGAIN PRICES

The Howard Vaughn sale of Shorthorns which was held at Dixon May 26 suffered a considerably lower average than had been expected, due to the fact that one-half of the offering consisted of bulls the demand for which has slackened as the season has advanced. Another factor to affect the sale seemed to result from buyers who attended the Caledonia sale the day previous filling their needs. In general it can be said that the female values represented unusual bargains in a most useful class of cattle. An average of $155 surely leaves plenty of margin for the buyer to make a fine return on his investment.

The sale which was the initial sale for Mr. Vaughn since moving to this state from Iowa was planned more to get the herd and farm before the buying public. A fair crowd was present but the offering was absorbed by a few buyers. The following buyers appear in the sale list: Caledonia Farms, West Sacramento; Wm. McGrath Co., Watsonville; Edward C. Flint, Sacramento; Newhall Land and Farming Company, San Francisco. The William McGrath Company was the heaviest buyer. All during the sale Mr. Vaughn showed his gameness and never once complained at the prices being paid.

The sale was managed by the California Breeders Sales and Pedigree Company, Sacramento. Col. Ben A. Rhoades and Col. John A. Davis were the auctioneers.

AS TO "ORGANS"

We referred last week to the "organ" as found in the livestock newspaper field. These, in one form or another, have long been with us. Some have done good work, and some have not. Still a correspondent wants to know what we really think of them.

A breed "organ" is a good or an evil influence, just according as it is conducted. If along sane, constructive, helpful lines, with a view towards building instead of unrestrained "boosting," the organ doubtless has its proper place in the general scheme. Papers of more general circulation have so broad a field to cover that after discussing fundamental principles of breeding, feding and management, reviewing leading shows and sales, they are unable to publish miles of matter relating to this herd or that, to this strain or the other—to the detailed exploitation, in short, of the individual operations of large numbers of owners. Still many people seem to want this, and if they are willing to pay for it that is a perfectly legitimate service. If, on the other hand, the prime object of the publisher is to just fatten his own purse all he can by catering to the fads and fancies and speculations of professional breeders—as against actual users for practical farm purposes—we do not hesitate to say that the influence of any publication so conducted is distinctly bad; tending to encourage foolish speculation, with the editorial voice muzzled and prostituted to a mere merchandising service.

Organs owned and controlled by the breed organizations are, as a rule, free from the taint of money grubbing. There is no question of "you tickle me, and I'll tickle you" in their service. Unfortunately not all of the organs place breed interests above those of their patrons, and to the extent that any such periodical contributes to the setting up of false standards of value it undermines rather than builds up a breed.

It all depends upon the "organs." They are not necessarily good, nor necessarily bad, any more than any other class of farm publications. What is the editorial policy? What do the editors or publishers stand for in the business? That is the key to the answer to such a query.—Breeders Gazette.

INCREASE IN NUMBERS

Reports from special livestock reporters to the bureau of crop estimates, United States department of agriculture, indicate the following changes in supplies of hogs and cattle in the United States, during the first three months, in the past three years.

The number of hogs increased 1.6 per cent this year (from January 1 to April 1) as compared with a decrease of 0.2 per cent in like period last year, and an increase of 0.9 per cent two years ago. The births during the first quarter of 1921 were 1.9 per cent less than in like period last year and 12.6 per cent less than two years ago. The net movement from farms was 3.2 per cent less than last year and 23.8 per cent less than two years ago.

Cattle numbers increased 2.38 per cent during the first quarter of 1921, as compared with an increase of 0.25 per cent last year, and an increase of 4.23 per cent two years ago, during like period. Calves born this year were 4.8 per cent less than last year and 25.9 per cent less than two years ago. The net movement from farms was 21 per cent less than last year and 11.3 per cent less than two years ago.

"I AM A SCRUB"

I am a scrub—
Speaking bluntly—
But here is the rub—
Why will people feed me—
On pedigree food;
Why breed me
To honest blood?

I am a scrub;
My sire was a scrub,
And my children will be—
For long generations—
And then,
One happy day,
My offspring may be,
Like honest pigs.
Years after this,
Some will hark back
To my old line—
And spoil a dream—
Some breeder's pretty dream.

I am a scrub,
And thrive like one;
I eat more than a full-blood,
And sell for less.
When I am fed
On pedigree corn,
And have eaten five tons
Of registered hay
A purebred farmer comes
And drives me away.
And then he says, "By Heck!
You're loser a peck
Of iron men,
Old scout!
Oh, Aleck!
Get the ax,
And knock the others
Hard
On the snout."
—E. Gregory, in Breeder's Gazette.

Chas. W. Paine, secretary of the California State Fair, has announced the following judges for the 1921 show: Holstein cattle and Duroc swine, H. W. Kildee of the Iowa State Agricultural College; Jersey and Guernsey cattle, E. W. Majors, Los Angeles; Hereford cattle, Frank W. Van Natta, Highland; Shorthorn cattle, Capt. T. E. Robson, London, Ontario; Berkshire swine, Ralph Jenkins, Orleans, Indiana. Other judges have not been definitely decided upon.

89 cents a day-

A FARMER of Mound Valley, Kansas, recently replaced his old cream separator with a De Laval. Immediately, with the same amount of milk, his cream checks jumped from $1.37 to $2.26 per day—89c a day gain, or $324.85 a year.

This is only one instance of thousands where a De Laval has checked waste and added to its owner's profits. You may be losing even more than this; you may be paying for a De Laval and not getting it by using a cream-wasting separator or by hand skimming.

There never was a time when a De Laval Separator would pay for itself sooner, or when it would make you more money, than now. There are over 2,500,000 De Laval Separators in use the world over, because they save the most cream and serve the longest time.

See your De Laval agent now about getting a new De Laval — or write us for full information. The De Laval Milker, like the De Laval Separator, is a quality product. Send for full information.

WESTERN CANADA

Land of Prosperity

offers to home seekers opportunities that cannot be secured elsewhere. The thousands of farmers from the United States who have accepted Canada's generous offer to settle on FREE homesteads or buy farm land in her provinces have been well repaid by bountiful crops. There is still available on easy terms

Fertile Land at $15 to $30 an Acre

—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre—oats, barley and flax also in great abundance, while raising horses, cattle, sheep and hogs is equally profitable. Hundreds of farmers in western Canada have raised crops in a single season worth more than the whole cost of their land. With such success comes prosperity, independence, good homes and all the comforts and conveniences which make life worth living.

Farm Gardens, Poultry, Dairying

are sources of income second only to grain growing and stock raising. Attractive climate, good neighbors, churches, schools, good markets, railroad facitities, rural telephone, etc.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write

LIVESTOCK SALE CALENDAR

Holsteins

June 9, Burr Farm and Agee Bros., Burr Farm, Los Angeles.

The Ortega Underhill Ranch at Santa Barbara has sold the great line bred Tipton boar, Masterpiece, to H. G. Cartledge of Columbus, Georgia. This boar has been used by Mr. Underhill as a link in the development of the ideal type of Hampshire hog and he leaves a lot of progeny behind him in the O. U. R. herd.

V. F. Dolcini of June Acres Stock Farm, Davis, reports the sale of five Duroc-Jersey gilts to the Alameda County Sanitarium and a spring boar to the Newhall Land and Farming Company of San Francisco. All of the above animals were sired by Choice Wonder 3d, grand champion at the last state fair.

Dr. Maynard Rosenberger recently purchased 75 head of grade Guernsey cows in Oregon for the Adohr Stock Farm, Los Angeles. The Adohr herd is one of the largest collections of Guernseys in the West.

The Diablo Stock Farm, Danville, reports a brisk demand for Polled Herefords and Duroc-Jerseys. Recent sales include two bulls, nine yearling heifers, four bred sows, six gilts and one herd boar to the Hammond Lumber Company, Eureka; two bulls of service age to A. M. Bemmerly of Woodland; two yearling bulls, one two year old bull and two females to W. E. Clark of Modoc County; a yearling bull to J. W. McClellan of Martinez and a boar to J. Overacker, Mission San Jose.

Dean H. E. Van Norman of the University Farm School, Davis, has been granted an extended leave of absence in order that he may undertake the direction of the proposed World's Dairy Congress to be held at Chicago in 1922. Dean Van Norman expects to leave shortly for a visit to several European dairy centers to confer with delegates to the congress.

In the Eastern Guernsey Breeders Association sale 56 Guernsey bulls and females sold for a general average of $1,087. Westbrook Ultra Rose, a cow with a record of 621.99 pounds of fat, topped the sale at $4,000.

That there is developing a growing demand for American Shorthorns for the Argentine is indicated by the fact that 116 head recently were exported from a New York port. Included in the shipment was Pelipar Iris, the grand champion bull at the last International.

This office has received the catalog for the Warren Gray sale of Jersey cattle to be held at Marion, Oregon, June 8. Forty head are listed by Sales Manager Chas. M. Talmadge of Salem.

T. E. Lovell, manager of the Blackhawk Rancho, Diablo, states that Collynie Prince Lavender, the Shorthorn bull that he selected from the Duthie sale in Scotland last year, is developing nicely and before long many of the Blackhawk cows will be safe to his service. Collynie Prince Lavender is the only bull in America that was bred and sold by Mr. Duthie, dean of the Shorthorn world.

Announcement was made last week that J. A. Robson, general manager of the Associated Dairymen of California, had resigned.

Following the sale of Shorthorns at Caledonia Farms, last week, the Newhall Land and Farming Company of San Francisco purchased at private treaty nine open heifers, a three year old cow and four young bulls.

Judging from the list of nominators in the California State Fair Futurity the Poland China show promises to be a "hummer." The following herds have been entered: Nettie E. Andrews, Modesto; A. L. Bassett, Hanford; M. Bassett, Hanford; Bassett Bros., Hanford; Geo. V. Beckman & Sons, Lodi; Alfred Buckland & Son, Fresno; W. L. Choisser, Turlock; Jas. H. Clark, Fowler; J. M. Crawford, Fresno; Marvin Cross, Bakersfield; Chas. E. Dack, Fresno; A. J. Elliott, Tulare; Fred Gatewood, Fresno; Johnnie Glusing, Winton; W. L. Haag & Son, Hanford; J. F. Harriger, Gridley; C. Harold Hopkins, Woodland; H. A. Johansen, Fresno; K. C. H. S. Boys' Agricultural Club, Bakersfield; J. F. Lehman, Lodi; P. B. Long, Tulare; H. D. McCune, Lemoore; Charles McNutt, Fresno; Fred D. Ross, Hanford; Howard Stephens, Bakersfield; W. D. Trewhitt, Hanford; A. J. Vancleef, Riverdale; R. L. Waltz, Hanford; R. J. Yates, Orland.

The Kings County Cow Testing Association has reorganized and, according to W. G. Maxfield, every herd in the association is headed by a pure bred bull.

In the dispersal of the Finnel Stock Farm's herd of Herefords at the farm near Galt, May 28, 98 lots made a general average of $137. The sale was held under the handicap of a large number of bulls, a small crowd and cattle in only moderate condition. I. L. Borden of San Francisco was the heaviest buyer with 35 head to his credit. Lafe Ward of Galt bought 18 head of the better lots, including the exceptionally well bred herd bull, Cardinal, a son of Domino. Chas. F. Silva of Sacramento selected 13 head. Other buyers are included in the following list: W. F. Pierson, Slough House; Diamond Ranch Company, Red Bluff; H. J. Buchanau, Berendo; W. C. Hildredth, Manzanar; H. M. Barngrover, Santa Clara; Anna C. Hall, Galt; Weis and Jones, Eugene; W. W. Murphy, Milton, and H. J. Need, Galt. The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company. Cols. Rhoades and Davis were the auctioneers.

THE KIND OF CATTLE TO BUY

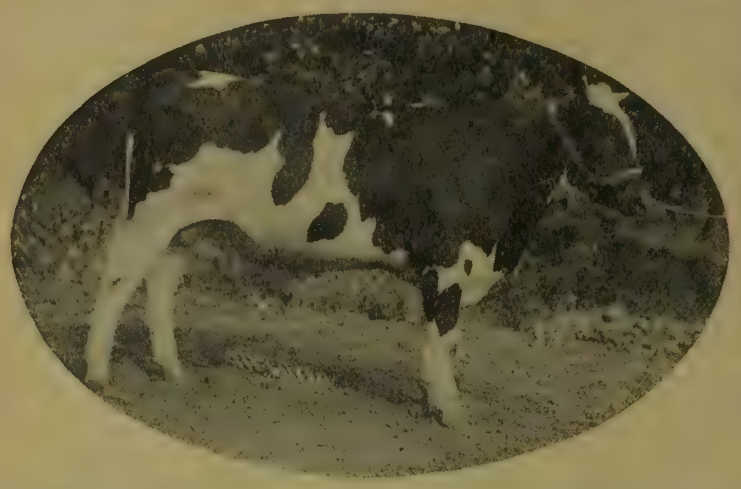
It is important for every beginner to consider the kind of cattle that he should buy. This matter should be given much thought by anyone who desires to begin with the assurance of success, and this is the ambition of everyone, or should be, who engages in the business. The writer has repeatedly stated that the important factor—the one which is secondary to no other—is the man behind the business. If he is endowed with personal traits which make for success in stock production; if he likes good livestock, which means that he will study animals and properly care for them, give them the opportunities of developing, and use good bulls—that man will succeed when the one who does not possess such traits will fail. Successful breeders are only found among those who like animals of good form, and who take pride in seeing them grow, noting their defects and studying how to mate so as to overcome them. Such a man has a pride in his work. That pride guides him to the proper goal.

Every man who invests in a registered animal should aim to produce good stock. He should, of course, take into consideration the class of trade that he will endeavor to supply, and, to some extent, local conditions. The small breeder of today often is the big one of tomorrow. No matter how humble the beginning, there is room at the top in livestock production as in any other calling. Many of the big men of today in the livestock breeding world were unknown when they began their stock breeding careers. Many of them were men of small or limited resources. They invested wisely. They took care of their holdings and forged ahead and to the front solely on the merits of their productions.

As a rule, the successful and discriminating breeder who knows blood lines is willing to pay fair prices for cows of this class. Price does not make the animal, but good form, as a result of blood recognized as productive of the best, usually does justify and make top values, and if one is to get the most out of one's investment one must aim to produce the kind of cow which will produce the kind of young that will sell near the top values current. If one is producing that kind and exposes them for sale at a point where there are buyers who do know and value good breeding maximum values usually will result, even though the owner be a stranger to the show ring and his name seldom seen in an advertisement.

My advice to a beginner is to keep his head but buy good cattle and take care of them. He will reap his reward where one who does not make such a beginning will not make much progress. If there are buyers for $3,000 cows, aim to produce them. It is not often that conditions in the trade make for such values, but the right beginning, the right blood lines, plus the right care and the use of good sires, will place a breeder in the enviable position of having good stock to sell, and maximum values which average well for a series of years will be his, and his profits will grow proportionately. The right kind of cows is

Sir Prince Aaggie Mead



We would like to have every breeder of Holsteins who is interested in securing greater production in his herd, and a larger market value for the surplus breeding animals he may want to sell, to consider carefully this outstanding young bull representing one of the very best Aaggie Acme De Kol of Valley Mead matings to date.

He is just now beginning to see service, and of course it will be some time before we shall have any of his get to offer, but you may well plan ahead to own a son of this outstanding young sire some day. Remember that a half interest in him sold for a higher price than has ever been recorded for a total price on a Holstein bull in California, with the single exception of the half interest price in his more than half brother, Sir Aaggie De Kol Mead, out of the same dam.

His Sire: KING AAGGIE MEAD, by King Mead of Riverside and out of the foundation cow Aaggie Acme of Riverside, 1,054.1 lbs. butter in one year at 11½ years of age. He is thus a full brother to Aaggie Acme of Riverside 2nd, 1,331.70 lbs. butter in one year, the world's strictly official record, and she in turn is the dam of Miss Aaggie Acme Burke, 1,034.66 lbs. butter from 24,338.9 lbs. milk in one year as a first calf junior 2 year old, world's milk record when made, and this year as a junior 4 year old she made 35.38 lbs. butter from 726.4 lbs. milk in 7 days.

His dam: MISS VALLEY MEAD DE KOL WALKER, the greatest female descendent of De Kol of Valley Mead, with 36.81 lbs. butter in 7 days and 1,113.57 lbs. in one year as a junior 3 year old, breaking three world's records as a 2 and 3 year old, and her dam, De Kol of Valley Mead 2nd, held the world's record for two year butter production as a 3 and 4 year old. She is widely rated as one of the great young matrons of the breed, and has three splendid sons now in active service.

SIR PRINCE AAGGIE MEAD will alternate in service in our herds with his maternal brother SIR AAGGIE DE KOL MEAD, where they will both be given very heavy service on high class females.

Owned Jointly by:

Stop & Consider

TYPE -I-
World's Record in Production

SYCAMORE ACRES

I have more females in my herd who are either sisters or daughters of the following bulls than any herd in the United States:

KING SEGIS PONTIAC

King Segis Pontiac Alcartra—His $50,000 son.
King Segis Pontiac Chicago—His $20,000 son.
King Segis Pontiac Count—"The Marvel Sire."

Could you go wrong on some of these? I can spare a few. Fresh cows, springers or yearlings. Priced right; tuberculin tested and guaranteed right in every way. Come and see them. One hundred twenty-five head to select from. Six miles east of Perris.

ROBT. N. CLAPP—NUEVO, RIVERSIDE CO., CAL.

Herd Bulls

Harris Standard 2d

Beau Blanchard 76

Nevada Hereford Ranch

J. H. Cazier & Sons
Wells, Nevada

A government accredited herd. No reactor in 16 years. A herd whose record in the show and sale ring is only surpassed by the esteem accorded its productions by cattlemen. We can furnish bulls or females to fill any need—and at sound prices. Visit our herd or write for information.

HOLSTEIN Fred Hartsook RANCH CATTLE

We have assembled an excellent foundation herd of females and will be glad to have breeders call. Fred Hartsook, Lankershim, California.

Italian Vineyard Company
Big Type Berkshires

Some dandy young boars for herd headers. The choicest breeding and ready for service.

Every one tuberculin tested and cholera immune.

Alex. M. Wilson, Supt. **Guasti, Cal.**

available now at reasonable prices. It is a good time to lay a foundation for a real herd. Many men, however, put off buying until "boom" times, when there is a general scramble for stock and not enough to go round. Values then soar, and $3,000 cows are numerous. A few years previously the same cows might have been had for much less.

The wise buyer puts in his stock when it is selling at a fair value. He should be ready to sell when values are high. This rule has been adhered to by thrifty men from the dawn of civilization. The $3,000 cow under present values of her produce, the get of a good bull, is a good investment, and, properly handled, her young being properly fed out, will yield a greater return than will an indifferently bred cow that is an indifferent producer at one-sixth of the investment. This has been demonstrated time and again. Bear in mind that the value and desirability of stock depend on pedigree, quality and the care given it.

A man's success as a producer of real cattle, and the profits that he gets out of the business, are gauged largely by the facts here outlined. The cost does not matter so much as the kind, in the case of a lover of animal form who has an ambition to make a place among the constructive breeders of the country.—Geo. E. Martin, in Breeders Gazette.

BEET PULP AND ALFALFA

Good alfalfa hay needs no amendments to make it palatable to cattle, but additional food is needed for producing dairy cows, and other materials may be mixed with it that will add both food value and greater palatability. This would be still more true of alfalfa damaged by rain. Alfalfa hay, according to Professor F. W. Woll, contains 9.70 per cent of digestible protein and 38.50 of carbohydrates and fat, with a nutritive ratio of four per cent. Dried beet pulp contains: digestible protein, 4.10; carbohydrates and fats, 64.90, with a nutritive ratio of 15.80. Therefore a mixture of the two make a better feed than either separately.

Professor Woll says: "We note that a ration of only alfalfa contains larger amounts of digestible protein and less digestible carbohydrates and fat than called for by accepted feeding standards. While furnishing sufficient nutrients for low producing cows, such a ration of alfalfa only does not enable good dairy cows to make the best possible production." It will be noted, from figures herein quoted, that by mixing alfalfa with beet pulp the protein content would be lowered and the carbohydrates increased, nearly an ideal combination. One dairyman suggests 20 pounds of alfalfa to ten pounds of beet pulp. Prof. Woll says: "Barley, dried beet pulp, coconut meal and mill feeds are ordinarily the cheapest concentrates in this state and these feeds have approximately a similar feeding value, pound for ponnd."

"WIN WITHOUT BRAGGING—LOSE WITHOUT SQUEALING"

The slogan adopted by the Iowa Junior Clubs, "To win without bragging—to lose without squealing," is worthy of consideration by grown ups. If the junior club work does nothing more for the youngsters than to thoroughly instill that thought into their minds, it will have done an inestimable amount of good.

The frequent illustrations that are given by adult exhibitors that they are not good losers makes it evident that they did not learn the Iowa slogan when young. Certain it is that there is much too much "squealing" done now in the judging ring and other places.

MUNICIPAL CAMPS IN NATIONAL FORESTS

Free permits for eight municipal recreation camps in the national forests of California have been issued by the U. S. forest service. This state is taking the lead in establishing these camps where the residents of the cities which maintain the camp may obtain a summer outing at cost.

Last year four such camps were operated in the California national forests, two by the city of Los Angeles and one each by Sacramento and Oakland. These four represent an investment of $70,000, and nearly 5,000 guests were accommodated.

This year Los Angeles will have a third camp in operation, and San Diego and Fresno and Riverside Counties expect to open camps also. In addition to its camps the Los Angeles playground department organizes and supervises two week hiking outings in the Angeles forest. Three of the eight camps are in the Angeles, two in the Cleveland, and one each in the Sierra, Stanislaus and Eldorado national forests. The camps are from 25 to 150 miles from the municipalities that maintain them.

Only residents or taxpayers of the municipalities that operate the camps are eligible as guests, and, because of the low cost of the outing, each camper is required to render on an average one hour's daily service, as outlined by the director in charge, and must also furnish his own bedding. Guests are well housed, fed and entertained. The following rates for a two week outing, including transportation, were in effect last year:

Los Angeles—Angeles forest, Camp Seeley, 75 miles, $12.75; Angeles forest, Camp Radford, 90 miles, $14.25.

Oakland—Stanislaus forest, Camp Oakland, 150 miles, $18.

Sacramento — Eldorado forest, Sayles Flat, 90 miles, $25.

These rates were all for adults, and the rates for children under ten were from 50 to 60 per cent of the above. The lower rates at the Los Angeles camps are probably accounted for by the fact that these camps have been in operation for several years, while 1920 was the first season for Sacramento and Oakland. The Los Angeles camps accommodated over 3,500 of the 5,000 guests at the municipal camps in the national forests of the state. The business men of Sacramento are so well pleased with their municipal camp that they are raising a fund of $10.000 to be donated to the city to build permanent cabins at the camp for sleeping quarters, such as are already installed at the Los Angeles camps.

THAT SPOILED ALFALFA

The unusually heavy May rains rendered thousands of tons of cut alfalfa valueless for hay, a total loss so far as feeding value is concerned. But mildewed alfalfa as a fertilizer and humus forming material is as valuable as the best warehouse hay. Every year orchardists make heavy purchases of alfalfa, bean straw and similar materials for turning under the soil and any and all of it is of greater value than fresh barnyard manure.

Dr. Van Slyke, chemist of the New York agricultural experiment station, gives the chemical composition of alfalfa hay: Nitrogen, 2.45; phosphoric acid, 0.50; potash, 2.10; mixed barnyard manure: nitrogen, 0.50; phosphoric acid, 0.25; potash, 0.50. It will be noted alfalfa hay has practically five times as much of that most valuable nitrogen as the average stable manure, twice as much phosphoric acid, and more than four times as much potash.

Of course the value of barnyard manure depends very largely on the care given, for 65 per cent of the fertilizing value is resident in the urine. Dr. Van Slyke says: "In regard to stable manure, the composition and history of which we have no means of knowing, any estimate of value nearer than 25 or 50 per cent must be regarded largely as guesswork." It is, of course, understood that alfalfa that has not mildewed, no matter how wet it may have been, is still of good feeding value, and its palatability and food value may be much increased by mixing with molasses, beet pulp and such similar amendments as are available.

The University farm at Davis is now planting 31 varieties of cotton, hoping to find one early enough to mature in the Sacramento Valley.

The state department of agriculture has just completed a survey of the Sacramento Valley, and finds young hoppers plentiful and eggs still hatching.

DISPERSAL SALE

50---REGISTERED HOLSTEINS---50

40 FEMALES—10 BULLS

H. A. De Wolf Herd, Ripon, Cal.

Wednesday, June 15, at 10 A.M.

In the dispersal of this herd there is offered a group of young cattle, popularly bred, and including a number of females with substantial official records and daughters of high record cows. The offering includes:
A 27 POUND COW with 589.92 lbs. butter in one year as a junior 2 year old, her dam a 28 lb cow.
TWO DAUGHTERS OF ABOVE 27 POUND COW, one by a son of Aralia De Kol, the other by a grandson of Tilly Alcartra.
A 24 POUND granddaughter of Colantha Johanna Lad that milked 601.9 lbs. in 7 days as a junior 4 year old, and her daughter by a son of Sir Skylark Ormsby Hengerveld.
A 23 POUND COW sired by a grandson of Pontiac Korndyke, and her daughter by a son of Sir Skylark Ormsby Hengerveld.
A 21 POUND junior 3 year old daughter of King Mead of Riverside, and her two daughters by a son of Sir Skylark Ormsby Hengerveld.
A DAUGHTER OF KING MEAD OF RIVERSIDE out of a granddaughter of Aralia De Kol, second dam a 27 lb. daughter of a 28 lb. cow.
A DAUGHTER OF SIR VEEMAN KORNDYKE PONTIAC out of a 22 lb. junior 4 year old.
A DAUGHTER OF SIR VEEMAN KORNDYKE PONTIAC out of a dam sired by a half brother to the 32 lb. cow Winifred Hotaling 3d.
A DAUGHTER OF SEGIS PONTIAC DE KOL BURKE, out of a 25 lb. three-quarter sister to Prince Gelsche Walker, and her two daughters, one by King Mead of Riverside, the other by a son of Sir Skylark Ormsby Hengerveld.
14 DAUGHTERS OF SIR SKYLARK ORMSBY KORNDYKE, son of Sir Skylark Ormsby Hengerveld. Here is one of the rare opportunities to secure granddaughters of this great sire.
THREE GRANDDAUGHTERS OF JENNIE TERZOOL HICKS 4TH that made 32.70 lbs. butter from 600.3 lbs. milk in 7 days, and 959.05 lbs. butter from 21,-550.6 lbs. milk in 305 days.
TWO DAUGHTERS OF KING GELSCHE WALKER KORNDYKE the good son of King Morco Alcartra and the 32 lb. Miss Gelsche Walker Korndyke, daughter of Prince Gelsche Walker.

TEN BULLS IN THE OFFERING

SIR SKYLARK ORMSBY KORNDYKE, born May 17, 1917. He is sired by the famous Sir Skylark Ormsby Hengerveld, one of the best sires the breed has yet developed in California. He is a high class individual, a sure, quick breeder, and is siring a most promising lot of calves, many of which are in this sale.
KING NETHERLAND SKYLARK MEAD, born May 25, 1919. By King Mead of Riverside and out of a 27 lb. daughter of a 28 lb. cow. One of the last opportunities to secure a young son of King Mead of Riverside.
8 YOUNG BULLS by the herd sires and out of some of the best dams in the herd. This is an opportunity for dairymen to buy young bulls of excellent blood lines.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

THIS IS A COMPLETE DISPERSAL, excepting only two heifer calves that are not catalogued, and every animal positively sells to the highest bidder.

TERMS OF SALE: One-third cash, balance in three, six, and nine months, with approved note. Terms are cash unless arrangements for credit are made with sale manager prior to the opening of sale.

PLACE OF SALE: The sale will be held on the farm until recently owned by Gotshall & Magruder, now owned by C. A. Miller, just north of the bridge on the main highway, about one-half mile south of the town of Ripon.

DISPERSAL SALE

125 Registered Holsteins 125

GOTSHALL & MAGRUDER, RIPON, CAL.

Wednesday, June 29, 1921

The sale of this splendid herd affords one of the most attractive buying opportunities of the season, and includes every animal in the herd excepting one high record cow that is not in salable condition.

In announcing this sale we wish to make the condition leading up to it perfectly clear. This herd was fast becoming one of the leading herds in California when Holstein breeding circles were shocked by the sudden death of one of the partners, Karl Gotshall. The development of the herd was continued, but in the settlement of the estate some changes were necessary and for the purpose of carrying on the breeding business a corporation was formed, The Gotshall-Magruder Company.

This sale includes every Holstein, except the one cow noted above, owned by Gotshall & Magruder, and will serve to wind up the breeding business of that firm.

The Gotshall-Magruder Company at present has control of a herd of considerable size, and recently acquired the excellent farm formerly owned by C. A. Miller on the French Camp Road about 6½ miles northwest of Ripon. This company will maintain a herd of substantial size on this farm, and plans are already under way for its development from the material now composing the herd.

The cattle will be sold under the usual guarantees as to breeders, and the usual tuberculin test conditions. Details of the offering will begin in next issue.

TERMS OF SALE: One-third cash, balance in three, six, and nine months, with approved note. Arrangements for credit must be made before sale with the owners, GOTSHALL & MAGRUDER, Ripon, Calif.

Auctioneers:
Col. Ben A. Rhoades, Los Angeles

You'll enjoy the sport of rolling 'em with P.A.!

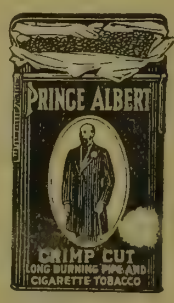
FIRST thing you do next—go get some makin's papers and some Prince Albert tobacco and puff away on a home made cigarette that will hit on all cylinders!

Do it while the going's good! Such flavor, such coolness, such more-ish-ness—well, the only way to get the words emphatic enough is to go to it and know yourself!

And, besides Prince Albert's delightfulness, there's its freedom from bite and parch which is cut out by our exclusive patented process! Certainly—you smoke P. A. without a comeback. Joy'us? You'll say so!

Prince Albert is the tobacco that revolutionized pipe smoking. If you never could smoke a pipe—forget it! You can—AND YOU WILL—if you use P. A. for packing!

Prince Albert is sold in toppy red bags, tidy red tins, handsome pound and half pound tin humidors and in the pound crystal glass humidor with sponge moistener top.



PRINCE ALBERT

the national joy smoke

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

Day & Night Solar Heater Co.

Johnson's Defender Jr.

Heads my herd of carefully selected sows. He should be seen to be appreciated. I can spare a few choice females or young stock either sired by or mated to this good boar. You will be pleased with any purchases made from me.

H. C. WITHEROW Live Oak, Cal.

Distribution of Holsteins in the United States

Final census figures for the year 1920, given out by the Holstein-Friesian Association of America, show 352,071 pure bred Holsteins in the United States, of which total 304,595 are registered females and 47,476 are males, owned by about 28,000 breeders.

New York leads all states in number of pure bred Holsteins with 82,953. Wisconsin is second, with 59,266, Ohio third, with 29,061.

Grouping the states, the Central States rank first in numbers. Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin, have a total of 175,269 pure bred Holsteins.

Ranking second are the Middle Atlantic States, comprising Delaware, Maryland, New Jersey, New York, Pennsylvania, Virginia, West Virginia, with a total of 121,098.

The New England States are third, with 27,999.

The Pacific Coast States, California, Oregon and Washington, show a large increase, the present total being 15,462.

The Western States, Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming, have a total of 6,130.

The weakest of all are the Southern States, which eleven states, Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, show only 6,113 pure bred Holsteins.

The development of the dairy industry and the Holstein business follows the establishment of large cities and manufacturing areas where many small sized cities are located.

According to the United States department of agriculture, there are some 11,000,000 Holsteins of all kinds in the United States. The Holstein-Friesian breed is the largest of all the pure bred dairy breeds and holds all records for milk production from one day to a year, yet it has only 352,071 of this number on the books as pure bred. There are, according to government figures, some 26,000,000 dairy cows of all classes—grades and pure breds—in the country. It will take many years of breed development to replace with pure breds all of the grade and scrub dairy cattle now helping to supply the world with the greatest food known to mankind. But the use of pure bred Holstein bulls has done much to improve the milking tendencies of common stock.

The census further showed 4,224 breeders belonging to local Holstein clubs, 3,338 to be members of state Holstein associations, some 2,000 doing official testing work in their herds, about 2,500 belonging to cow testing associations.

The detailed figures of the census by states follow:

New England States—Maine, 4,557; NewHampshire, 3,722; Vermont, 8,924; Massachusetts, 6,986; Rhode Island, 339; Connecticut, 3,471; total, 27,999.

Middle Atlantic States—Delaware, 1,171; District of Columbia, 406; Maryland, 2,048; New Jersey, 4,994; New York, 82,953; Pennsylvania, 26,375; Virginia, 2,619; West Virginia, 532; total, 121,098.

Central States—Illinois, 17,308; Indiana, 5,440; Iowa, 7,251; Kansas, 6,445; Kentucky, 800; Michigan, 24,602; Minnesota, 14,855; Missouri, 3,182; Nebraska, 3,154; North Dakota, 1,461; Ohio, 29,061; South Dakota, 2,444; Wisconsin, 59,266; total, 175,269.

Western States—Arizona, 1,034; Colorado, 2,604; Idaho, 944; Montana, 822; Nevada, 47; New Mexico, 65; Utah, 453; Wyoming, 161; total, 6,130.

Pacific Coast States—California, 8,760; Oregon, 2,185; Washington, 4,517; total, 15,462.

Southern States—Alabama, 325; Arkansas, 359; Florida, 78; Georgia, 421; Louisiana, 311; Mississippi, 452; North Carolina, 316; Oklahoma, 1,552; South Carolina, 384; Tennessee, 777; Texas, 1,138; total, 6,113.

Army Aids "Better Sires" Campaign

G. Arthur Bell of the army remount service, U. S. army, states that the "better sires" campaign for the production of high class saddle horses suitable for army use is taking hold strongly in the western states. In an interview at the headquarters of the Horse Association of America he said that the cattle ranchers of the West had been most numerous of all in their requests for army remount service stallions.

The plan of the army remount service to bring about a supply of good cavalry horses is to place pure blooded stallions in communities where there are a sufficient number of mares of good type to warrant. The call for this service has been very strong in Virginia, Kentucky and Tennessee, and now the western states have joined in. The stallions furnished are Thoroughbreds, Morgans, American Saddle, Arabs and Standardbreds. While more than a thousand requests have been received, the army remount service is proceeding cautiously and has placed only 125 stallions on stand this year. Service fees are charged, which accrue to the government, but the net result of placing these stallions will be that a large number of horses suitable in type and breeding for cavalry work will be produced, which will be coming on for future needs of the army.

The necessity of work of this kind is clearly evident. Army officers are finding it next to impossible to buy suitable horses on the open market, and as the army requires at least 4,000 of first class cavalry type each year a plan to encourage steady production was evolved. It is interesting to note that the work now being carried on by the army remount service is along the same lines as that practiced in France for the last hundred years, where the placing of stallions owned by the French government has stimulated the breeding of good saddle and cavalry horses. It also brought about a material improvement in the character of horses produced in communities where government stallions have been permitted to stand for service.

The influence of this distribution of stallions is very great. It is an object lesson to farmers and breeders that to produce good saddle or cavalry horses they must breed to pure bred sires of one of the light breeds, suitable in size, conformation and blood lines. This, in turn, will have a far reaching effect on production of all types, for as soon as it is thoroughly realized that good stock cannot come without good sires, inferior sires in all breeds will be discontinued.

Experienced horsemen, conversant with the plan of the army remount service, state that this is the most constructive step ever taken to obtain a steady supply of horses suitable for army needs. This is important to the taxpayer, for good horses of the right type and breeding last ten years in army service, thus reducing army expenditures for replacement purposes.

The army remount service is exerting a powerful influence toward an increase in horseback riding, polo and all equestrian activities, bringing home to civilians the health giving advantages of horseback riding. The idea is to create such demand for saddle horses from civilian riders as to assure a wide and steady market for the saddle horse stock being produced. It will also create a reserve which will be available in the event of war.

NATIONAL SALE OF BERKSHIRES

There wll be three big Berkshire days at Riverside in February, 1922, when the National Berkshire Sale is to be held there. California being the second highest state in the Union in number of Berkshire transfers last year had a perfect right to claim the sale for 1922 and the Southwestern Berkshire Congress went to bat and demanded it for California and for Riverside.

The national sale is the one big event of the year as it accompanies the meeting of the American Berkshire Congress and the congress lays aside $2,500 for the entertainment of the guests. The city of Riverside has added $500 to this amount and the

Southwestern Berkshire Congress has agreed to raise $2,000 to supplement these amounts. This will probably be done by a donation sale of bred sows in August.

It is planned to hold a complete Berkshire show with full classes of California hogs competing against the Eastern animals brought out for the sale. It is hoped to have Prof. Russell of the department of agriculture to judge the display. The Berkshire celebration will be held a few days before the orange show at San Bernardino so that the Easterners who are coming in considerable numbers can take in both affairs.

Local arrangements are in charge of D. J. Bastanchury and Geo. Stengle, president and secretary of the Southwestern Berkshire Congress, with the entire personnel of the congress to help them out.

WELL BRED HOGS GAIN WEIGHT MORE RAPIDLY THAN DO SCRUBS

The importance of good breeding in the growth of livestock, and especially in the prevention of runts, is illustrated by the experience of an Indiana swine grower. "I started with stock," he remarks in a letter to the United States department of agriculture, "direct from the foundation stock of the breed, and the results were satisfactory. When I had time to read of the work of other men, the results of feed composition and experimental feed trials, I took from these experiences what I thought practical for me to follow, and the results, though not exceptional, have been the natural results of good blood and good feed. One of my boars, farrowed in April several years ago, weighed 165 pounds the following September. At 16 months he weighed 606 pounds, at 28 months 850 pounds, and the following fall 1,015 pounds. This boar was one in a lot of 15, as uniform a bunch as I ever saw. Others grew into 600 and 800 pound hogs under farmers' care."

"In addition to good blood lines," he adds, "care and the right kind of feed are important means of preventing undersized animals, but the most important of all is the man with the feed basket, for it is 'the eye of the master that fatteneth his cattle.' So far as runts are concerned, I have never found it profitable to raise them under any treatment. I have seen lots of 'before and after taking' illustrations on paper but not in the feed lot."

LOWEST IN TEN YEARS

Prices of meat animals (hogs, cattle, sheep and fowls) to producers of the United States decreased nine per cent from March 15 to April 15, according to a report issued by the bureau of crop estimates, United States department of agriculture. In the last ten years prices paid for meat animals have increased 4.5 per cent during the period from the middle of March to the middle of April. The report shows that on April 15 the index figure of prices for meat animals was about 37.9 per cent lower than a year ago; and 16.3 per cent lower than the average of the last ten years on April 15. The statisticians of the department point out that the high prices paid for meat animals during the last few years is the result of increased demand during and immediately following the war, and that the present prices are appoaching those maintained during normal times preceding the war.

CALIFORNIA'S RAW MILK SUPPLY

The result of a study of raw milk distributed in most of the larger cities of California, whose milk inspection departments have recently been approved for grading by the state department of agriculture, shows that the average quality of the raw milk retailed is of a very high order. In recent years dairymen generally have received the benefit of intensive educational training on the essential factors in the production of good quality milk and doubtless on account of the close association of the raw milk dairymen with the activities of city, county, and state inspectors, raw milk now reflects a high quality product. The raw milk distributers represent 77 per cent of the distributers of these cities and an estimate of the average bacterial count per cubic centimeter in the raw milk supply of these cities by the north curve shows 35,000 per c. c., which indicates the efficiency of the grading system employed in all of these cities and the very creditable work being accomplished by dairymen and inspectors.

In cities having a graded milk supply it is pleasing to note that regulations requiring testing of all animals introduced into raw milk herds are being enforced. This cooperation augments the work of the veterinary inspectors and is of immense value to the dairymen and much appreciated by the state division of animal industry. A comparative survey of the raw milk distributed in California conveys the assurance that this class of milk is safe and of good yuality.—John S. Hay, Cal. Dept. Agr.

LIVESTOCK AND SUGAR BEETS

There is a close and important relation between the production of sugar beets and the raising of livestock, especially cattle and sheep, according to Farmers' Bulletin 567, recently revised and republished by the United States department of agriculture, on Sugar Beet Growing Under Irrigation. Not only will the live stock, if properly handled, produce an important part of the farm income, but they are very essetial to soil improvement.

Sheep and Cattle Thrive on Beet Tops

The keeping of live stock enables the beet grower to make the best possible use of the beet tops, which, in connection with roughage, easily produced, keeps the live stock in good condition and enables the farmer to return the mineral element in the tops to the soil and increase the supply of humus which is of especial importance in irrigated sections. Sheep as well as cattle thrive on beet tops, but it is wise to feed them sparingly at first.

In some localities stock is pastured on the tops after the beet roots have been removed. This saves time and labor, but it is rather wasteful of the tops and frequently injures the ground. It is usually more satisfactory to gather and haul the tops to the feed yard and feed them from a rack, or they may be used as silage either in a silo or in a trench four or five feet deep and long and wide enough to hold the tops and the roughage necessary to make the silage. A layer of straw about six inches deep should be put in the bottom of the silo. The beet tops and straw or other roughage should then be added in alternate layers, and firmly packed to prevent spoiling.

The by-products of the beet field and sugar mill that are of especial importance to the farmer are the beet tops, pulp, molasses, and the waste lime. Many farmers sell the tops for cash, prices ranging from $2.50 to $5 per acre. This is usually not the best practice. The tops are of greater value as a stock feed and contain elements which should be kept on the farm. Beet pulp is likewise an excellent stock feed and may be used either fresh as it comes from the mill or dried. Beet molasses is the residue after the crystallizable sugar has been removed from the concentrated beet juice. It may be fed by itself or mixed with chopped roughage by spreading it over beet pulp, alfalfa, etc., or drying it with beet pulp. Waste lime is a by-product of the sugar mill, which, under certain conditions is of considerable value to the farmer in correcting the acid condition of the soil and in making the heavy soils more friable.

Sugar Beet Area Extensive

Sugar beets are grown in 17 states, in ten of which the growers depend, in whole or in part, upon irrigation. The successful production of sugar beets under irrigation depends not only upon an adequate supply of irrigating water, but upon a suitable system of crop rotation, a thorough preparation of the seed bed, careful planting and thinning, timely and thorough cultivation, in addition to a supply of live stock which will balance with crop production. In addition to a suitable irrigating system the land should be provided with a satisfactory system of drainage; furthermore, the soil should be well supplied with humus.

MINERALS FOR HOGS

Bone meal flavored with about ten per cent of tankage and fed at the rate of one pound per day for each 100 pounds of live weight fulfills the necessary mineral requirements.

The need for feeding mineral supplements comes under artificial conditions, as when hogs are confined in dry lot, or where they receive but little leguminous roughage, and for pure bred breeding animals.

FREE BOOKLETS ON

Florida Sour Seed Bed Trees, six to sixteen inches high, straight roots, stocky trees. L. A. Tuttle Nurseries, Route 1, Pasadena.

Florida Sour Seed bed stock. Paul B. Magee, 100 Ventura St., R. F. D. 2, Box 499, Pasadena, California.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

California Sweet Seed Bed Stock, 6 inches and upwards. Kloeckner & Lee, 51 N. Chester, Pasadena, California.

DUROC-JERSEYS

Weanling Boars and Gilts by Pathfinder Wonder (Great Wonder I Am ex an 800 lb. Pathfinder sow) for $10 each. Bred sows and gilts. Derryfield Farm, Capital National Bank Bldg., Sacramento, California

For Sale—One registered Duroc Jersey gilt 8 months old. Sire "Mammoth Sensation, Jr." Dam, "King's Golden Girl." Price $100. Otto Leander, R. F. D. 1, Fullerton, California.

Boyanna Big Type Durocs — Breeding stock, priced right for sale. Inquiries invited. Satisfaction guaranteed. J. Boyd Harrold, Dixon, California

High Class Durocs—Two fine early litters, 10 each. Dam 2nd in strong class, Owensmouth. See A. V. Austin, Van Nuys, California

For Sale—Pure Bred Duroc Jersey Boar, registered, 600 lbs., $100. R. Fischer, La Verne, California.

BERKSHIRES

Lark Meadow Berkshires—Bred or open gilts. Bred sows. Prominent blood lines. Geo. A. Stingle, El Monte. BUY A BERKSHIRE BOAR.

Berkshire Gilts—Bred for late spring litters. Boar pigs of breeding age. Calac Orchards, Martinez, California.

POLAND-CHINAS

Registered Poland Chinas. 40 tried brood sows; 40 gilts. Some choice young boars all at reduced prices to move at once. These Polands are as good as can be had anywhere at any price. W. D. Trewhitt, Route B Box 47, Hanford, Calif.

Big Boned Poland Chinas—Bred gilts and young boars priced to sell at once. Young stock, either sex, for sale at all times. Bassett Bros., Hanford, California.

Bred Poland China Gilts sired by California Gerstdale and bred to Some Price. $75.00 and up. J. A. Crawshaw, Hanford, California.

Big Type Poland Chinas—Breeding stock of both sexes for sale at all times. Prices reasonable. J. N. Cook, Orland.

HAMPSHIRES

Buy Registered Hampshire Hogs for your breeding stock. Write the H. G. Ranch, Solvang, California, what you need and their will send prices.

TURKEYS

Large Number of Choice Bronze Toms and hens, also geese and herding Collie Dogs. Shipped from St. Helena and San Miguel. John G. Mee, San Miguel.

Bourbon Red Turkeys, Buff Ducks, Buff Orpingtons. The Ferris Ranch, Reseda, California.

Mammoth Bronze Turkey Eggs, 30 cents. W. L. Duvall, Pomona, California.

PATENT ATTORNEYS

WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

CATTLE

Guernseys — Grape Wild Farms—Berkshires—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

Shorthorns bred for Range Purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome, information cheerfully given. T. T. Miller, Hollister, California.

Berylwood Stock Farm—Breeders of registered Holstein cattle and Duroc-Jersey swine. Every cow an A. R. O. and T. B. tested. Bulls and females for sale. J. W. Snodgrass, Hueneme, California.

Registered Jersey Bulls For Sale—Some excellent individuals of the St. Lambert strain with high testing dams. Ages, ready for service down to calves. The prices will suit you. E. M. Ward, Box 68, Lancaster, California.

Being Short of Pasturage, will sell few mature cows. Buyers' choice of herd. Tuberculin tested. Write Redwoods Ayrshire Farm, La Honda.

Yearly Record Holsteins—Bulls from 500 to 1,000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

Breeders of Registered Shorthorns—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

Registered Holstein Bulls of various ages for sale. Millbrae Dairy, Millbrae, California.

Some Choice registered Holstein heifers and bulls of serviceable age for sale. J. W. Scudder, Escalon, California.

HORTICULTURAL PRINTING

Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles

NEW AVOCADO ASSOCIATION OFFICIALS

In order to make as rapid progress as possible in marketing arrangements the directors of the Avocado Association have met twice since the annual meeting. The following officers were elected: President, W. L. Hardin, Los Angeles; vice-president, A. F. Yaggy, Santa Barbara; treasurer, J. M. Elliott, Los Angeles; secretary, R. Agnes McNally, Altadena.

An outline for starting active work has been formulated. A letter has been sent to the members of the association, urging them to cooperate in making the success of the new organization possible and offering special inducement to those who offer their support at once when the need is greatest. The active membership fee is $16 per year. All who have trees approaching a producing age and who expect to market fruit at any time within the next few years, whether in large or small amounts, should immediately give this marketing organization their support by becoming active members now. The initial financial support for the work and expense during the balance of this year is very necessary. Now is the time to build the foundation for the future market.

POTATO FIELD DAY

The next field meeting of the potato growers' department of the Los Angeles County farm bureau, together with allied organizations, will be held on June 7, and an unusually large attendance is expected as potato growers from all surrounding counties and as far away as Fresno and Tulare Counties will be present. At 10 a. m. the field demonstrations will be held on the Stahl ranch near Zelzah in the San Fernando Valley. Lunch will be served at the Van Nuys high school and the afternoon session held there. This program will be given up to standardization and plans for cooperative marketing. Geo. H. Hecke, state director of agriculture, has promised to be present, also some of his official staff.

PETRIFIED FOREST

The petrified forest of Arizona, really a series of petrified forests, lies a short distance south of Adamana, on the line of the Santa Fe railway. There are four "forests" included in a government reservation called Petrified Forest National Monument, created by presidential proclamation in 1906. The name "forest" is not strictly appropriate, for the petrified tree trunks are all prostrate and are broken into sections. The logs are the remains of giant trees that grew in Triassic time, the age of reptiles, according to the United States geological survey. The trees were of several kinds, but most of them were related to the Norfolk Island pine, now used for indoor decoration. Doubtless they grew in a nearby region and, after falling, drifted down a water course and lodged in some eddy or sand bank. Later they were buried by sand and clay, finally to a depth of several thousand feet. Their conversion to stone was effected by gradual replacement of the woody material by silica in the form called chalcedony, deposited by underground water. A small amount of iron oxides deposited at the same time has given the brilliant and beautiful brown, yellow and red tints which appear in much of the material. The sand and clay in which these trees were buried were afterwards washed away. Some of the tree trunks are six feet in diameter and more than 100 feet in length. In the first forest there is a fine trunk that forms a natural bridge over a small ravine, the water having first washed away the overlying clay and sand and then, following a crevice, worked out the channel underneath. The length of this log is 110 feet, and the diameter four feet at the butt and one and one-half feet at the top.

The petrified woods are beautiful objects for study. When thin slices are carefully ground down to a thickness of 0.003 inch or less and placed under the microscope they show perfectly the original wood structure, all the cells being distinct, though now they are replaced by chalcedony. By studying the sections F. H. Knowlton, of the geological survey, has found that most of these araucarian trees were of the species Araucarioxylon arizonicum, a tree now extinct. It is known to have lived at the same geologic time also in the east central part of the United States, where the remains of some of its associates have also been found. These included other cone bearing trees, tree ferns, cycads, and gigantic horsetails, which indicate that at that time the rainfall of the Southwest was abundant.

Cherimoyas

MODERN CONVENIENCES FOR FARM HOMES

The rural home is fast becoming a place of comfort and where all modern conveniences are had just as in the city. Electric lights, water works, sewage disposal systems and all of these things are reaching the point where they are looked upon in the country home as a matter of course. I venture to make the assertion that within the next ten years there will be practically as big a percentage of our country homes having electric lights, electric washing machines, electric ironing machines, electric irons, vacuum cleaners, waterworks, sewage disposal systems, etc., as are found in the towns and cities.

Right now is a good time to think about this matter and to make plans to properly equip the home with these modern conveniences. Look through our advertising columns and secure information from the manufacturers of these various products and you will be surprised how cheaply they can be bought and installed. — Progressive Farmer.

Rose Bowered California Home

MACHINE SIZERS AN AID IN GRADING POTATOES

Grading potatoes consists of two somewhat distinct operations, namely, sorting for size and sorting for defects. No machine is human enough to sort out the defective stock, therefore this must be done by hand, but machines have been devised which will size more accurately than can be done by hand. The eye is not a very reliable guide in sorting to a certain size. U. S. potato grades require White Rose potatoes to be divided as to size at the diameter of 1¾ inches. Experience has shown that when a person attempts to size such potatoes by hand he is inclined either to place many potatoes of No. 1 size in the No. 2 grade, or many of the No. 2 size in the No. 1 grade. This personal equation can be eliminated by the use of a good sizing machine.

Sizing machines vary widely in results accomplished. This variation is due in part to the manner of operation and in part to the type of machine used. They should never be loaded beyond their capacity for efficient work. The results observed show that a round mesh screen is more accurate than one of square mesh. This is because the diagonal of a square is much longer than the sides, and large potatoes, if turned cornerwise, can drop through the holes. Screens with round or nearly round mesh have holes of practically the same dimension in every direction. Before purchasing a sizing machine for potatoes, the grower should make careful investigations as to the different machines on the market.

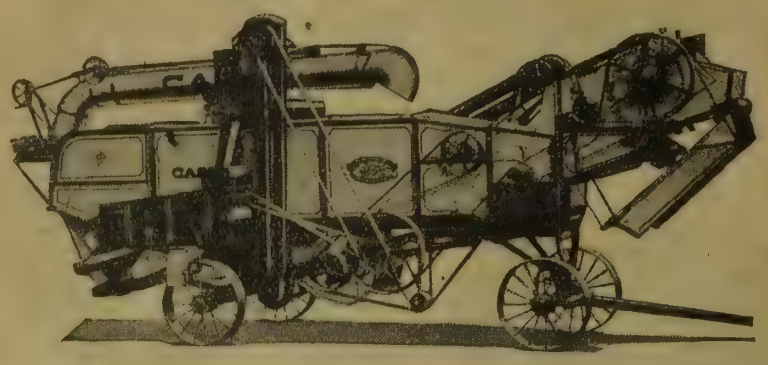
Many growers have hesitated to use machine sizers on account of the cost and the fear of "skinning up" the potatoes. Machines can be purchased at a cost of $50 to $400, according to size. It is true that any machine will skin the early potatoes to some extent, but a half hour after the operation the difference is not noticeable. The experience of growers and shippers in new potato sections where machines are used is that the small amount of bruising caused by their use does not affect their market value.

CALORO PROMISING RICE FOR CALIFORNIA

A new variety of rice, known as Caloro, and well adapted to both new and old land, is being distributed to California rice growers by the Sacramento Grain Association (Inc.), which has cooperated with the United States department of agriculture in rice breeding experiments at Biggs. This new variety is pronounced the best of several in selections made and grown under comparable conditions during the past few years. It has outyielded all of the standard varieties of rice grown in California from 8 to 30 per cent during the past four years. In 1919 it gave an average yield of 7,874 pounds per acre as compared as compared with 4,800 pounds from 5,800 pounds from Early Wataribune, and in 1920 a yield of 6,300 pounds as compared with 4,800 pounds from No. 1600.

Caloro matures about two weeks earlier than Late Wataribune, or five days earlier than Early Wataribune, seven days later than No. 1600, and ten days later than Onsen. It is the opinion of those who have the opportunity of watching the results from this new variety that it is superior to Early Wataribune, now generally grown in California, in every respect and eventually will replace it. Seed for 6,000 acres was made available this year.

22x36 Case Thresher Equipped with Re-Cleaner for Hulling Clover and Alfalfa



Salvaging the World's Crops
With Case All-Crop Threshers

In the important work of salvaging the world's crops after they are harvested, *Case Steel-built, Galvanized Threshers* each year render a great service to Humanity and Civilization. Without the help of modern threshers, such as Case Machines, it would be impossible for the farm workers of today to save the annual crops.

A Size for Every Need

Case Threshers have been built since 1842 and this line of justly renowned threshing machines now includes a thresher for *every seed crop* and a size suitable for every threshing need. There is the small 20 x 28 machine for individual threshing, while the light weight 22 x 36 and 26 x 46 threshers are ideal for average "community" service and the 28 x 50, 32 x 54, 36 x 58 and 40 x 62 big-capacity machines meet every requirement for custom threshing on any scale.

Look for the EAGLE Our Trade Mark

A Thresher for Every Seed Crop

In localities where grain and hay are the principal crops, *Case Grain* and *Grass-seed Threshers* are upholding and adding to Case reputation for clean threshing, thorough separation, perfect cleaning and complete saving of the threshed crop. In the pea- and bean-growing districts *Case Pea and Bean Threshers* are rendering a like service. In rice-growing sections of the world *Case Rice Threshers,* which are unaffected by moisture, are performing their work with equal satisfaction and the same is true of *Case Peanut Threshers.*

Case Threshers are "all-crop" machines. That is, at a slight additional cost, they can be equipped and adjusted to handle *grain, grass seed, peas, beans, rice or peanuts.* This may be done in the field in a short time.

Attachments for Case Threshers

All sizes of Case Threshers can be equipped with feeder or hand feed; windstacker or common stacker, or any one of a variety of improved grain handlers. All of these attachments are of our own design—*Case-made* for *Case Machines.*

No matter where you are, nor what crop you grow, there is a Case Thresher of a size and type to meet your requirements. Our catalog may prove of interest to you.

Poultry House Types

By Jean A. Koethen

"Our little systems have their day,
"They have their day and cease to be."

THUS wrote one of England's greatest poets. Lord Tennyson was not thinking of chickens. Probably he did not know a chicken house from a smoke house, but the lines will serve well as a text on which to hang a brief history of poultry housing in the past 15 years.

On a shelf with my other poultry literature is a little brown pamphlet entitled "The Philo System of Progressive Poultry Keeping." I paid a dollar for it soon after its publication in 1909. It professes to instruct the novice in the fine art of raising broilers on a city lot, and contains, among other details, the ground plan of a city lot, "showing the arrangement of 60 Philo System coops and walks where $31,450 worth of broilers can be raised in eight months on a city lot 50 feet square."

I do not know whether or not Mr. Philo ever accomplished the feat himself, but I have strong suspicions that he made more money with his book than he ever made with poultry. Certainly his venture came to grief in a few years. His system worked pretty well for a short time on a city lot. When he moved to a New York farm and later to Florida he passed out of the poultry world, and his system broke down by its own weight.

The trouble with the Philo system is, or was, that it was too much work. Theoretically it is possible to keep six hens and a rooster or 50 chicks or 25 broilers in a coop three by six, but it does not work out in practice. Birds so closely confined must be surrounded by the most sanitary conditions, and that, if any number of fowls are kept, means a tremendous amount of work. A good many people tried the system in its day, and some succeeded for a while, but always the labor involved led to its abandonment.

Figure 1—A Glendale Poultry House
Type of house as recommended by University Farm, Davis.

Labor the Secret

Success or failure in poultry keeping is very largely a question of the amount of labor required per hen. The man who can care for 1,200 hens or more without hiring help is in a position to reap more profit than the man who keeps 2,000 birds and a hired man. The one-man poultry farm is, other things being equal, the most profitable farm, and the poultry house which provides sanitary accommodation for the greatest number of birds is the perfect house.

Note the words "sanitary accommodations." Everything hinges upon that. How many hens can be kept together in a single house or unit and be kept healthy?

The Corning System

About the time the Philo system was being advertised, the Corning system was also occupying considerable space in the advertising pages of eastern poultry journals. The Corning system goes to just the opposite extreme, and confines from 1,000 to 2,000 hens in a single house without any yard at all. This system was originally a backlot system, but it was taken up and adapted to large poultry plants and is in quite general use in some sections of California. Its merit is that one man can care for more hens in such a house than in any other. It takes little longer to fill feed hoppers for 100 hens than for 25, and the cleaning of such a house is by no means proportionate to the number of birds, as compared with a smaller unit. The Corning house is divided into separate sections, each holding from 100 to 300 birds, in order to avoid drafts, but the sections are separated only by an open doorway, so that each hen has the run of the whole house.

The disadvantage of this system is that whatever affects the health of one hen, whether it be a contagious disease or some unsanitary condition, soon affects all. Foul drinking water in one single fountain poisons the whole flock. When hens are kept in small flocks it is easy to keep tab on their health. A sick hen is noticed immediately. If chicken pox attacks one unit it may be months before it spreads to the next. In a large flock it is not so easy to check disease nor to watch the health of the birds.

Figure 2—House Used on the McAllister Ranch at Inglewood

The Weeks House

Based to some extent on the Philo system, but involving far less labor, is the Charles Weeks house, which is

popular in some sections of this state. In this house 20 hens or 25 pullets are kept in a unit eight feet square, and the long house made up of these units is entirely open in front with windows for air circulation in the rear. Like those already mentioned this is a no-yard system. The hens are never out of the house till they go to market at the end of their career.

Larger No-Yard Flocks

"Do you mean to say," said a man the other day, "that hens can be kept healthy in a house where they are confined from one year to another without a chance to get out of doors?" I told him I wasn't saying; I only knew that some poultrymen were doing that very thing successfully. Whether it can be done year after year continuously I do not know. There are those who believe it can.

Between the Weeks house on the one hand and the Corning house on the other there is a long stretch of middle ground, and not a few advocates of intensive poultry keeping are

Figure 3—No-Yard House

On Eads Ranch near San Gabriel. The units in his house are 12 by 12, and accommodate about 50 hens, which are never outside the house.

taking their stand on it. I have seen a house 16 by 20 in which 75 to 80 hens were kept closely confined and doing splendid work. I have seen one 12 feet square in which 50 hens were kept, and another about 20 feet square in which from 100 to 125 hens were confined. Whatever plan is used, at least four square feet of floor space are allowed for each occupant, and absolute cleanliness is vital. The floor is covered with sand, with a thick layer of straw on top, which is removed when it becomes filthy. Adherents of this plan claim that more perfect cleanliness can be attained by this method of housing than by running the hens in yards which are not frequently purified by a green crop.

Houses with Yards

The house shown in Figure 1 is similar to that used at the university farm and recommended by the poultry division. It is arranged for 40 to 50 hens in two flocks. The elaborate system of windows and shades is by many considered too complicated, and I have seen such houses on only one or two plants. A house like that shown in Figure 2, divided into sections 16 by 20, each accommodating from 100 to 150 birds, with either a shed or gable roof, and with yards in front or behind or both, is the type of house most in favor all over this part of the state. The nests may be along the front or under the droppings board, and in some cases the front is boarded up to about one-third of its height. The yards may be large or small, single or double. As a rule the droppings boards are separated by a tight partition, and the space between droppings boards and front covered with wire in order to admit abundant ventilation. There is generally a window under the droppings board for summer use. Feed troughs may be built along the front under the nests or large square hoppers may be used inside. There are almost as many variations of this type of house as there are poultry men using it, but all are adapted to this climate and giving good results.

Poultry Queries

Conducted by Jean A. Koethen

Head Louse

Do the big gray lice found on the heads of chicks live on hens? If so, on what part of the hen? Are they the same as the common body louse of hens? I have two hens with chicks. One is clean, yet her chicks had head lice. On the other I found body lice, yet her chicks were entirely clean. I dusted both hens twice during incubation.—Mrs. C. H. Lancaster.

The head louse of chickens is described as "a dark grayish species nearly one-tenth inch in length, found on the top or back of the head, behind the ears or beneath the bill. Usually it is located close to the skin with its head very close to or against the skin, the body extending away from the skin on the down or along the feathers." This is the louse from which the poultryman must guard his young chickens. Lard rubbed on the head when the chicks are hatched is the best protection. If lice do appear, the lard may be used again.

The common body louse is light yellow and is found mainly around the vent and under the wings of adult birds. Various kinds of louse powders are recommended for these lice, but the United States department of agriculture prefers sodium flouride to all others, claiming that its effects last longer. A pound of commercial sodium fluoride, it is claimed, will treat 100 hens if applied by the "pinch" method, a pinch on the head, one on the neck, two on the back, one on the breast, one below the vent, one in the tail, one on either thigh, one under each wing.

As to why head lice should have been found on chicks under an apparently clean hen, I can only suggest that the powder used was not efficacious for this kind of lice, and that some escaped alive and undetected. It is a good plan to grease the heads of all chicks hatched by hens, whether the hen seems clean or not.

(Continued on Page 763.)

POULTRYMAN'S CALENDAR—JUNE, BEGINNING TO CULL

By the first of June all the little chicks are out of the way, the cockerels ready for market, if not already marketed, and the hens beginning to let up in production. Now is the time to concentrate on eliminating the loafers. A hen that begins to drop feathers or goes broody (if she is a Leghorn), or whose comb is shrunken and pale, is almost certain to be an unprofitable hen. It is a good plan to put the hens in a pen by themselves and try them out. In most instances it will be found that the production of the rest of the flock remains about the same after they are removed. In a flock that has been carefully culled in previous years there may be no June molters. Where culling has not been practiced there are sure to be some.

The loafer hen may be distinguished not only by molting and broodiness but by her dull eye, her indifferent appetite and languid movements. She does not sing; she does not scratch, and her shanks and beak are more often than not a fairly bright yellow even at the end of the laying season.

Beans: Supplies moderate. Per lb. Green Kentucky Wonders, 9@11 per lb., green pods, 6@8 per lb.; Wax, 6@8 per lb.
Beets: Doz., 30@40.
Cabbage: Field crate best mostly 3.25 @3.50; poorer, 2.25@2.35.
Carrots: Doz., 35@40.
Celery: Supplies light, market steady, best per cr., 9.00@10.00; poorer 8.00.
Corn: Supplies moderate, market weaker, best 40@50 per doz., 1.75 lug.
Cucumbers: Local best, 1.50@1.75 doz.; Hothouse, mostly 1.25@1.50; few best 1.75.
Eggplant: Supplies moderate. Imperial, mostly 17@20 per lb. Mexicans, mostly 12@15 per lb.
Lettuce: Local field crate quality poor, 75@90; best, 1.00@1.25.
Peas: Local best 5@7; Northern 11@13.
Peppers: Supplies liberal, market steady. Imperial Valley: Bells best, 30 @35; Chilis best, 25@30 per lb.
Radishes: 20@25 doz.
Rhubarb: Local strawberry 1.10@1.25 bx.; jobbing 1.00@1.15; Crimson Winter, 60@80.
Spinach: Mostly 20@25 doz.
Squash: Supplies liberal, market steady. Summer squash: Imperial Valley, best, 75@1.00 per crate. Local: 75@1.00 per lug. Italian 75@1.00 per flat.
Tomatoes: Supplies liberal, market stronger. Imperial Valley, per crate, best 2.00@2.25; poorer 1.50@1.75; jobbing, 1.85 @2.10.
Turnips: Doz., 45@50.

FRESH FRUITS

Cantaloupes: Supplies liberal, market weaker, pony crates 5.50, standards 7.50. Jobbing: ponies 5.00@5.25, standards 7.00@7.25.
Cherries: Black Tartarians, best 12 @15; poorer 10; Governor Wood 9@11; Royal Anne 13@15.
Apricots: Market steady, mostly 8@10 lb.; poorer low as 5; fy 2.25@2.50 per four basket crate.
Blackberries: Supplies light, market weaker. Best 3.25@3.75.
Loquats: Best mostly 5@7, few 9.
Strawberries: Supplies moderate, market stronger. Per crate, 30 pints, best 6.25@6.75, poorer 5.50@6.00; fy., 7.50@8.00.
Raspberries: Supplies moderate; best, 3.25@3.75; poorer, 3.00 per 30 pint crate.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm on good stock. Local: per box, market pack 2.00@2.50, special packed brands 3.00@3.25.
Lemons: Supplies heavy, market dull, wide range in prices. Local: packed box 2.25@2.75, few high as 3.00, loose 1.00@1.75 per box, per lug mostly 50@75.
Oranges: Supplies liberal, market steady. Navels, market pack, large size 3.00@3.50, small low as 1.75, special brands, large size 4.25@4.75, small sizes 3.00@3.50. Valencias, best brands, all sizes 3.75@4.00, packing house culls 50@75, few best 1.00@1.75 per box.

HONEY

As reported by the Bureau of Markets: Southern California, Los Angeles: Supplies of White honey light, of Light Amber grades heavy. Movement slow, market dull. Carloads f. o. b. usual terms, per lb. White Orange Blossom 10@12; White Sage 10½@12½; White Alfalfa 7½ @8½; Light Amber Sage, 8@9; Light Amber Alfalfa 6½@8. Hawaiian, White 7; Honey Dew honey 4½. Recent hot winds have badly hurt Orange and Sage honey prospects and with southern Sage already seriously damaged by cold and dry weather, a very light crop of the lighter colored honeys is forecasted. The Alfalfa crop is probably normal. High retail prices are still maintained throughout California, and hurt honey distribution locally. Some large shippers expect a firm market, account light crop this year; other factors are still pessimistic. New honey will move in light quantities this month and next, but shipments in large quantities are not expected before July. Beeswax: Sacked in l. c. l., Light 25@30; Dark, low as 23 per lb.

GRAIN AND FEEDS

Grain Exch. price bid May 31:
Corn: Bulk, No. 2, Yellow 1.66¼.
Kaffir: Eastern, No. 2, 1.75@1.80; No. 3, 1.66¼@1.75.
Milo: 2.10; No. 2 Eastern bulk, 1.80.
Barley: 1.23¾.

HAY

Alfalfa Growers of California report under date of June 1:

Rabbit Alfalfa	27.00
No. 1 Dairy	24.00
Standard	20.00
Stock	15.00
Fertilizer	15.00

About 50 per cent of the grain hay south of Tehachapi was cut before the rain. This will be nearly a total loss.
Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	20.00@28.00
Barley	16.00@24.00
Alfalfa, No. 1 Dairy	22.00
Standard	16.00
Straw	10.00@13.00

San Francisco Markets

San Francisco, May 31, 1921.

Quotations made daily by San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

Henderson Bush	4.90
Cranberries	6.80
Bayos	10.50
Blackeyes	7.50

HAY AND FEED

Under date of May 28, A. W. Scott Co. says:
Receipts past week 615 tons. These light receipts have mainly been caused by weather conditions and the interruption in baling and handling by the recent rains. Notwithstanding the light tonnage prices are easier. The immediate effect of the rains has been to damage a quantity of Volunteer that was down, and this being used as far as possible for local consumption has had serious effect upon the demand for first cutting alfalfa and stock hay. The secondary effect will be to put quite a quantity of stained and damaged hay upon the market at prices that will have a depressing effect upon sound and better grades. The Nevada alfalfa is seeking a market here on account of the immense carry-over from last year and the quantity of the new crop now coming along. Offers on good hay have been made as low as $14 delivered San Francisco.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	18.00@20.00

Milo	39.00@40.00
Corn Meal	39.00@41.00
Molasses, Bbl.	26.00

Citrus Markets

Los Angeles, June 1, 1921.

Citrus growers are generally well pleased with the heavy rains of last week. The holding back of shipments also had a beneficial effect on the market. Fruit is expected to size up better than if the rain had not come. There are still about 500 cars of Navels and miscellaneous varieties of oranges remaining for shipment and yet unsold before Valencias will have a clean field. Hot weather throughout the East has sent up the price of lemons, $9.70 being the record price.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 24,008 cars; lemons, 5,472; total, 29,480. To same date last season: Oranges, 20,125; lemons, 4,410; total, 24,535. From Central California to date this season: Oranges, 6,291; lemons, 138; total, 6,429. To same date last season: Oranges, 5,306; lemons, 288; total, 5,594. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

POULTRY QUERIES

(Continued from Page 761.)

If you are interested in varieties of lice and the treatment for them, write the U. S. Department of Agriculture, Washington, D. C., for Farmers' Bulletin 801. It costs nothing and contains much useful information.

Droopy Turkeys

Can anything be done for turkeys a month old which stagger around and have no control of themselves, but still eat well? Also when they get chilled and droop, is there anything to do but let them die? — Subscriber, Santa Ana.

There must be something radically wrong in the way these turkeys are cared for, or they would not get chilled and droop. Have they no mother to hover them, no brooder to which they can go to warm up? Little turkeys are far more susceptible to chill than chicks till they are two months old, and must be kept warm. In rainy weather they must be shut in out of the rain, and if the mother hen is careless about covering them she should be shut in a small coop where she will have nothing to distract her attention. Turks that have already been so chilled that they droop may possibly be saved by a thorough warming up and a little cayenne pepper in their food, but it is much safer to keep them from chilling. If the mother hen won't do her duty, and you have no brooder, try a jar or jug of hot water in a covered box from which they cannot escape.

As for the staggering, what is its cause, I wonder? Are the poults getting too little exercise and too much food, so that their bodies have outgrown their legs, or are they dizzy from indigestion? I suspect the former, because turkeys that eat well are never very sick. The sick turkey gets off its feed immediately. Try cutting down the ration and making them forage for most of their food for a little while. If they have been running in the wet it may be they have developed rheumatism, and stagger because their legs are stiff or lame. Keep them warm and dry, and don't feed too much, if you want poults to be healthy.

I AM THE TRACTOR

I serve all mankind. I am fashioned from the mineral wealths of Mother Earth to aid her servants who till the soil. I plow the land; I cultivate the growing crops; I reap and thresh the golden grain. I release mankind from the bitter drudgery of constant toil. I bring the fleeting moments of opportunity within the grasp of him who wills. I make two stalks of grain grow where but one grew before. I labor incessantly. The burning suns of summer tire me not. In the cool winds of autumn I but hurry faster to make the harvest secure. I never strike—what I start I finish. I create play time for the man who feeds the world. I exact payment for my labor only while I work, and I never grow tired. All soils are like one another to me—whether on the small farm or the great ranch I go always on and on. There is no stopping my progress. Doubt and opposition must give way to my demands for universal recognition because I serve and set men free. Mine is the just call of the giant of power. The fields of the world are mine to till—none shall deprive me of this great right. for I AM THE TRACTOR.—Thomas P. Hallock in The Tractor Builder.

MORE ABOUT CORY'S THORNLESS BLACKBERRIES

In your issue of May 14 Subscriber, Los Angeles, is asking information in regard to Cory's Thornless blackberries. This article was answered by someone who failed to sign his name. Whoever it was that answered it has said all that is required. His answer fits my case exactly. We are here for the purpose of helping each other and the columns of the Cultivator are always open for questions and answers. Here is my experience with Thornless blackberries, hoping this subscriber may be benefited by same.

A year ago last February I bought five kinds of blackberries in order to cover an unsightly fence. The fence would accommodate only ten plants at eight feet apart. I therefore bought two Mammoth, two Himalaya, two Cory Thornless, two Phenomenal and two loganberries. The loganberries were so small they eventually died.

A Friend of the Family

I therefore bought from a friend two more Cory's Thornless to replace the loganberries. The Thornless blackberries my friend sent me were thornless all right, but I very soon realized that I had too much for my money. It was Burbank's Thornless I had instead of Cory's. This variety I regard as absolutely worthless. In the winter I rooted it out and got a couple more of Cory's. It was late when I planted them, but they are making nice growth. These plants were strong rooted tips which are regarded as the best stock to plant.

Last summer I mulched and watered my blackberries very freely and was rewarded with a very fine growth. I tied in every shoot that grew, and this year they are loaded with berries that are now beginning to turn color. I do wish it were possible for the Los Angeles subscriber to see my two plants of Cory's. I am satisfied he would no longer hesitate in planting that wonderfully fine berry. If he wishes to gather blackberries, plant Cory's; if he wants growth only, plant Burbanks, and I'll guarantee it will cover the side of his house in one season. With me this season Mammoth is a little earlier than Cory's. They are making wonderfully fine growth, which for experiment I intend to leave the entire length and then train them on the fence in the winter. In a week I shall be gathering Mammoth, while the Himalaya is only just coming into flower. Of course, by planting Himalaya it extends the fruiting season. I have no love for Himalaya, for the man that works amongst them should be fortified with a cast iron suit.—Geo. Walters, Ross.

HOW TO FIGURE COST OF POTATO CROP

Figures from which the potato grower can make a fairly close calculation of his own cost of production are given in a preliminary report on labor and material requirements in potato production, just issued by the United States department of agriculture. These figures, gathered by the office of farm management and farm economics in the summer of 1920, represent results on 461 farms in nine potato growing districts of Minnesota, Wisconsin, Michigan, New York and Maine.

It is shown that labor and material costs, that is, man labor, horse labor, fertilizers and seed constitute about 80 per cent of the total cost of potato production in average practice. The department points out that the farmer knows what his labor and material requirements are in hours, bushels of seed, etc., or can easily determine them, and that by using these with current rates for labor and prices for materials he can readily approximate these costs. Since these costs are, roughly, 80 per cent of the total operating expense it is then but a simple problem to find out the total operating expense, including overhead, taxes, etc. To this must be added the charge for the use of land, to get the total cost.

In calculating these costs per acre for the 1919 crop in Waupaca County, Wisconsin, the basis for man labor was 77.4 hours at 40 cents; horse labor, 77.2 hours at 20 cents; manure, 12.7 tons, $2; seed, 10.6 bushels, $3.75. This was considered to constitute 82.3 per cent of operating expense.

The costs per acre determined from these basic figures were: Man labor, $30.96; horse labor, $15.44; manure, $25.40; seed, $39.75; total, $111.55 (82.3 per cent operating expense); total, 100 per cent operating expense $135.54. To this was added charge for use of land ($9.66), making grand total cost of growing an acre of potatoes in that county $145.20.

In the case cited the man labor rate increased 20 per cent and the cost of seed potatoes 300 per cent over 1919 figures, though the expenditures as measured in hours of labor, bushels of seed and tons of manure were practically the same. The accuracy of the results obtained by the farmer in estimating his costs by the method here described will depend largely upon how closely he is able to judge how his own labor expenditure per acre compares with the average for his locality.

CLEANING MOSS FROM FIG TREES

Commissioner Fred P. Roullard of Fresno County writes in the Associated Grower:

In most any part of the San Joaquin Valley in the winter trees, especially figs, may be seen covered with green moss.

Moss is a plant growth which causes the bark to rot and, when exposed to the sun, curl up and drop off, and when removed in this way the bark is seldom replaced by a new layer. All varieties of trees are more or less susceptible to moss infestation.

An application of lime and water at this time of the year will completely eradicate moss on trees, providing the work is thoroughly done. Be sure that every portion of the tree is covered as only that part of the moss which is hit by the spray will be affected by the solution.

Mix quicklime 10 pounds, water 2 gallons. This gives a stock solution to which enough water must be added to thin it to the consistency of an ordinary spray, or thin enough to pass through a spray nozzle. Filter the stock solution through a fine screen mesh, as a lumpy mixture will be very apt to clog the spray apparatus and cause no little trouble.

Place the lime in a barrel or some other convenient container and pour water over it, then cover the container and let it stand for about an hour. With an insufficient amount of water the lime is "scorched" and not all converted into hydrate; on the other hand, too much water retards the slacking by lowering the heat. "Scorched" lime is generally lumpy and transparent, hence the practice of first slacking the lime before adding the full amount of water desired.

Besides being used as a direct control for moss, in many cases this spray is used to protect the trees from sunburn and frost which results in dead bark on trees. Dead bark encourages the attack of borers and beetles which seek entrance to the wood in any weakened spot.

The above spray can be applied to any tree infested with moss with satisfactory results. Spray all trees when dormant for injury may result if the buds are open and leaves begin to start.

HEAVY LOSSES SUSTAINED IN EXPORTING APPLES

As a step toward correcting faults in the present methods of handling export shipments of American apples and pears and other fruits, specialists of the United States department of agriculture are studying the prevailing transportation conditions. During the last few months one of these specialists accompanied a cargo of apples and pears from New York to London, and inspected other fruit cargoes upon their arrival in London and Southampton.

While foreign markets have generally proved attractive to American apple shippers, much dissatisfaction arises because of the uncertainty of transit conditions and the heavy losses suffered by the fruit. In two important cargoes during the past season this loss was more than 50 per cent, and in the total export movement of nearly 2,000,000 barrels it is estimated that at least 15 per cent of the fruit is a total loss or shows substantial deterioration with consequent loss in value.

Various factors contribute to the loss, and it is planned to inaugurate certain definite experiments at the beginning of the next season, giving attention to more careful culling of injured fruit at the packing house, better containers, prompt loading on the steamships, with special emphasis on proper loading equipment and careful handling, and proper refrigeration or ventilation en route. With careful handling at all stages the fruit should reach the European markets showing no greater damage than in the longer rail shipments in the domestic traffic.

MEALY PLUM APHIS

Field Entomologist Theo. D. Urbahns, recently returned from a survey of prune and plum orchards, says that based upon his inspection and further emphasized by many reports being received, these orchards are rapidly becoming grossly infested with the mealy plum aphis (Hyalopterus arundinis Fabr.).

The first generation of the plant louse which is now generally present can be controlled by spraying with the following: "Blackleaf 40" 1 pint, fish oil soap 4 pounds, water (to make) 100 gallons.

The necessity for timely control measures against the early generations of the pest is due to the fact that when the insect reaches the later stages it is invested with a "mealy or flocculent coating" through which the contact insecticide cannot penetrate or wet, thus rendering futile the only control measure that can be applied.

Well managed hens are making money for their owners when the price of eggs is low. Poorly managed flocks never pay for their keep.

Farm accounts make the farm more account.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

"Handsome is that handsome does" applies with double force to the photograph on this week's cover. Over Lytle Creek boulders is flowing the golden wealth to thousands of acres of orange groves of southwestern San Bernardino County. With all this handsome service to humanity it is a wonderfully beautiful scene to look upon. This and thousands of similar scenes are made possible by the forest and underbrush which is protected on the watershed. It is protected and it should be given far greater protection by the carefulness and thoughtfulness of every camper and, in fact, everyone who has occasion to enter or even to pass through California mountains.

* * *

Teamwork has been again proven effective. Isolated interests have gone to Sacramento for many sessions of the legislature and appealed for consideration. As a rule they have gone home at the end of the session carrying expressions of heartiest sympathy from legislators who refused to grant that which was asked, but little of accomplishment. This year it's different. Agriculture has been recognized; it did not get all it asked; it did get sufficient to prove ample justification of the united work secured as a result of initiative taken at the state fruit growers convention held in Chico in 1919. In that convention the producers said; "We will have justice or know why." A committee was appointed which became a strong working force simply because the members dropped personal interests and cooperated. The extended article by Mr. Wilson elsewhere in this issue reviews a small portion of the work done by this committee.

* * *

Regarding the consideration given by the governor to the various bills which were sent to him by the senate and assembly, the horticultural commissioners of California recently in session in Sacramento resolved, "That we express to Governor Wm. D. Stephens our thanks and earnest appreciation for the active interest and support which the agricultural industry of this state has received at the hands of his administration. For the first time in the history of California agriculture has received from the state government the financial support which its importance merits, and which will enable the horticultural officials to properly execute all the measures devised for the protection of California's plant industry."

A look over one of the great piers at Los Angeles harbor, or more particularly at the six story warehouses where acres and acres of cotton bales are stored, and at vessels which are being loaded for Japan, for England and other sections of the world is convincing that the cotton industry adds materially to California's importance. In these warehouses there are now nearly 32,000 bales of cotton which are being compressed for steamer shipment as rapidly as the monster compress can handle them. The coming year's production will be materially reduced from that of last year. There will be more alfalfa, but California will still produce large quantities of the finest cotton on earth.

* * *

An Easterner, a New York City man, recently "did" California for the first time. He saw cotton, sugar beets, alfalfa, rice, truck farms, vineyards, deciduous orchards, citrus and subtropical fruits, all growing most luxuriantly. At two of the great harbors he saw ships loading with these products for all parts of the world. He stood on hilltops and looked over rich valleys which send by ship and trainload millions upon millions of the finest of products to the markets of the world. He was in packing houses, in factories, in great storehouses by the sea, and he looked back over the country to the other great factories by the Atlantic, and he remarked: "What a wonderful country this is!"

* * *

Many a field with its blackened and sunken haycocks exhibits an economic tragedy. Tens of thousands of tons of hay are ruined, yet with all its lessened value much of it will be baled and marketed, and those who have made careful examination, even analysis, maintain that this hay is vastly better in quality than appears possible. If it cannot be saved as feed, it can, much of it at least, be made into soil builders.

* * *

Today, Saturday, June 11, is Rice Day. Rice is high in nutrition, low in cost; it is delicious in everything from soup to dessert. Our health and our wealth may both be increased by more liberal use of rice.

THE FLAG

On June 14, 1777 congress officially adopted the flag which has now for 144 years floated over this nation. For nearly two score of years we have been observing Flag Day as an event of national importance.

There are various flag salutes. One of these, the silent salute, is observed daily in the military and naval service. The one pledge salute most common in California is:

"I pledge allegiance to my Flag and to the Republic for which it stands:
One Nation, indivisible, with liberty and justice for all."

D. S. PARKER

One of the very first cooperative farm telephone systems in California was that in the vicinity of Pomona, the organization of which some 20 years ago was recently referred to in the California Cultivator. D. S. Parker, one of its founders and manager since the beginning, died at his home in Pomona on May 27. Mr. Parker has been a lifelong cooperator, and under his management the Pomona Telephone and Telegraph Union has become a great success.

WATER TRANSPORTATION

The agitation for cheaper transportation is beginning to secure action. A slight reduction on some products has already been made. President Harding and congress have been reached in a way which makes it appear that a more sizable reduction will yet be made. Representatives of Pacific Coast producers recently met in Seattle and organized the Pacific Coast Producers Association with membership largely from cooperative associations of the coast and representing 57,000,000 boxes of fruit shipped annually. C. S. Whitcomb of California was made president of the association and a committee was appointed to confer with steamship companies and to pledge to those companies 9,000 carloads of apples, oranges, lemons and other fruits if the inter-coastal carriers would install cooled space.

Reduced railroad rates, or no reduced railroad rates, coast shippers will use water transportation as never before.

FARM LOAN

Federal farm loans cannot be made unless federal farm loan bonds are sold. This fact was fully appreciated by certain mortgage institutions when they began action to compel the recall of the federal farm loan bonds. Absolute failure resulted from their effort, but while the matter was in the courts no bonds could be sold, hence no loans were made. The bonds are now on the market in denominations of $100, $500, $1,000 and $5,000. Both principal and income are absolutely tax free. They are sold at par, or often slightly above, and are drawing but five per cent, but when it is considered that that five per cent is absolutely net whereas a public utility bond is often taxable, it is readily seen that the slight difference in interest rate is offset by this exemption. As this money is loaned to farm owners exclusively, appeal is made to farm owners to support it and increase their own wealth by purchase of these bonds. They should look wonderfully attractive to the farmer whose demands for operating capital do not require use of all his funds.

These bonds are as good as gold and have not yet suffered the depreciation which other securities, even other government securities, have. The federal land banks at Berkeley and at Spokane will send fullest information regarding these bonds, or arrangements may be made with the secretary of local farm loan association to secure them.

THANK YOU

The same mail brings to the editorial desk two envelopes. In one there is "Thank You," a pamphlet issued by a coach company in the city of New York. In the other is a circular from the state department of agriculture at Sacramento which is headed "Bruised Meat."

The "Thank You" pamphlet is of 32 pages and is given exclusively to expressions of appreciation on the part of patrons of the coach company because of little courtesies extended by its employes. Some 60 or more patrons have taken a moment from their busy days and written these appreciative words. The company is making a play upon this matter of courtesy and making it one of its principal features of business. It is resulting in money making.

The California department circular, however, shows wherein livestock people through their own employes, or perhaps transportation employes, are losing money because of brutality. It calls attention to bruised and injured carcasses often found in packing houses and in explanation the circular says: "The bruises are caused when the deliberate wielding of heavy clubs, prod poles which often are spike laden, whips, kicks from hob nailed shoes and even pitchfork prongs are brought into play."

There is a large farm on the Pacific Coast which is making money because of its contented cows, and the management of this farm insists that contentment can only be had by cows when they are treated kindly, and to this end they maintain signs in the milking stables: "Do not swear in the presence of these cows." Courtesy with cows pays.

RAILROAD BUNK

The proposal of the railroads to establish a flat rate on fresh vegetables and fruits of $1.75 to points east of Chicago and Mississippi and Missouri River points is stated by leading growers and shippers to lend practically no aid in relief of the present burdensome rates. Instead of the 33 1/3 per cent relief asked for in all zones, or a lifting of that one-third increase effective August 1, 1920, the present proposal reduces rates east of the points given but about ten per cent, while the bulk of our perishable crops like melons, cantaloupes and onions are marketed in Chicago and river points. Therefore the California Vegetable Growers Association and other organizations are sending telegrams to the railroads, interstate commerce commission, California senators and representatives at Washington.

We quote from wire sent by the potato growers of California, assembled this week at Van Nuys in the San Fernando Valley:

"It has been actually demonstrated in the handling of other California vegetable crops that the present railroad rates are prohibitive, the latest instance being the disastrous results attending the marketing of the Coachella Valley onion crop, recently harvested; therefore,

"Be it resolved, that it is the sense of this meeting, representing growers of about 20,000 acres of potatoes in Southern California, that the proposed rate adjustment is wholly ineffective and that the horizontal increase of 33 1/3 per cent should be immediately suspended and the entire matter considered in accordance with the recommendations of the California Vegetable Growers Association."

In other words, the railroads are handing the producers a lot of the usual bunk in the effort to show they are "reducing" freight rates.

New Agricultural Legislation

By R. N. Wilson

THE long fight of the deciduous fruit growers for appropriations and for attention by the college of agriculture and experiment station is bearing fruit in a very satisfactory manner.

Seven years ago a delegation made up principally of growers from the Santa Clara Valley, headed by H. C. Dunlap and L. Woodard, made a strong appeal to the university regents for more extensive investigations of deciduous fruit problems. The farmers' committee was met with courtesy but given to understand that little could be hoped for. Two years later the same experience was repeated with similar results. Three years ago a strong effort was made through a committee which was almost statewide in its make-up, to have the regents include $150,000 or $200,000 for deciduous fruit work in their budget which would be submitted to the legislature in the following January.

Some ill feeling was aroused at this time over the fact that the deciduous fruit growers were again given no encouragement, but it was not understood at the time that the state budget board had asked the regents not to increase their budget request over the previous biennium because of post-war conditions. Although the post-war outlook for finances was not the best for the state government, neither was it good for the farmer and with this in mind deciduous growers decided to carry their fight to the legislature. Although $150,000 was originally asked of the legislature this was reduced to $100,000 in committee and after a strenuous fight was passed by the legislature and signed by the governor.

The progress made with this $100,000 has been an inspiration to the fruit men who have known of the results accomplished to date. There has been some question as to whether or not this expenditure of $100,000 each biennium would be continued, but it has

(Continued on Page 786.)

Agricultural Legislation at Washington

By T. C. Atkeson, Washington Representative National Grange

THE emergency tariff bill was signed by President Harding on May 27 and becomes immediately effective. The schedules in this bill remain exactly as announced in the previous National Grange bulletins — wheat 25 cents a bushel, potatoes 25 cents, onions 40 cents, frozen meat 2 cents a pound, unwashed wool 15 cents a pound, butter 6 cents a pound, cheese 23 per cent, apples 30 cents a bushel, and a number of other agricultural items of equal importance. This act is to remain in effect for six months, and it is expected that the general tariff bill will be passed by that time.

The Washington representative of the National Grange has been in favor of this emergency tariff bill and has done what was possible to aid and expedite its passage on the broad and general ground that it was a step in the direction of giving agricultural products the same degree of protection as products of other industries in harmony with the protective tariff system which is the committed policy of the majority party.

Special attention should be again directed to the fact that vegetable oils are in this bill for the first time subjected to a tariff which affords some measure of protection to both American producers of vegetable oils and American swine growers and dairymen, which are subject to their competition. The oil importation business is of comparatively recent development and agricultural interests are only just now becoming informed in a national way of the competition which this involves, which competition is not confined to any industry or section but has adverse interests to practically every line of American agriculture.

General Tariff Bill

The ways and means committee is still working behind closed doors on the general tariff bill. Most of the sub-committees are understood to have completed their reports covering the different schedules, but each of these reports is being considered by the full majority membership of the committee with the implied understanding that whatever the majority members accept is to be made a party measure. One interesting feature is the reported proposal that when the bill finally passes it shall be effective from the date of its introduction. This is a proposition advanced by Congressman Longworth and is receiving serious consideration. How it can be accomplished is another question. The task of getting this bill into shape so that it can command sufficient approval from the multitude of interests affected is a gigantic one, involving not only a change in policy from that which has been in effect for eight years but also the changed economic relationship of the United States to the rest of the world. The National Grange representative has thought it the policy of wisdom to refrain from making any arbitrary demand on the behalf of special agricultural interests, particularly in this formative period of the bill, and to insist only that leaders and members in congress should accept at its full face value the principle adopted by the National Grange, that so long as a protective tariff is the policy of the country, the products of agriculture be given the same protection as the products of other industries. The Grange is prepared to insist upon a full and fair application of this principle and is assured of the support of a very large number of people, both in and out of congress.

Inside the ways and means committee itself there is growing evidence that not only the chairman but a fair proportion of the members, both majority and minority, are committed to this program, not at all because it is politically expedient but because they realize the fact that the business and economic prosperity of the nation rests finally upon a prosperous agriculture.

Careful observers think that the bill will pass the house in about the form in which it is finally reported from the ways and means committee but that there will be ample opportunity for change in details, if not in principles, before it is finally passed by the senate and that harmonious action by those interested in agriculture will secure full justice to this industry.

Sales Tax

Opponents of the sales tax have well nigh won the victory. The hearings were closed on May 27 after a series of attacks on the whole principle, practice and fabric of argument which has been built up for the sales tax. Inside the committee it already appears that Senator Smoot is about the only advocate left who is prepared to fight for the measure. Senator Watson, who was considered as in favor, is now said to believe that it is inexpedient at this time.

Following the statement of Professor Atkeson of the Grange, other farmer organizations, labor organizations, consumer organizations and business organizations as represented by the American Mining Congress, National Automobile Chamber of Commerce, the Retail Grocerymen's Association, and others went on record against a general sales or turnover tax. The case against the tax was summarized and closed by Professor Fairchild of Yale and Professor Seligman of Columbia University, recognized as two of the highest tax authorities in the United States, who completely answered every argument which had been made in favor of the sales tax. Both of these experts also disposed beyond answer of the contention that the excess profits tax was the cause of high prices by showing that on a rising market no excuse was needed and that in a falling market the excess profits tax could not possibly be passed on.

Filled Milk Bill

Congressman Voigt of Wisconsin has introduced a bill of great interest to the dairy industry, designed to prohibit the manufacture and sale of "filled" milk, that is, milk from which the natural cream has been removed and sold and cheap vegetable oil substituted to give the semblance of milk. There is real reason for the passage of a law of this kind at this time as a public health and honest business measure. The bill was referred to the committee on agriculture where it is hoped that hearings will be held at an early date.

Farm Loan Fund

The senate committee on banking and currency has reported favorably the Curtis bill which provides for the appropriation of $50,000,000 from the United States treasury to be used as a revolving fund to increase the efficiency and expedite the service to be rendered to farmers by the federal farm loan system. A strong spirit of friendliness to agriculture in the United States senate is shown by this action of the banking and currency committee and it is likely that this bill will be passed promptly.

Packer Control

As this is written the house of representatives is debating the Haugen packer control bill. The debate was opened by Chairman Haugen of the agriculture committee, who made a very strong speech in support of the measure, which is also being ably supported by Representatives Tincher, McLaughlin of Nebraska and Anderson of Minnesota, as well as other members of the agriculture committee, which is nearly unanimous in support of this measure. The bill will probably pass the house.

Grain Speculation

The Tincher bill for the control of speculative grain marketing seems to have stirred up considerable opposition from the grain exchanges.

Business Conditions in Agriculture

The house committee on agriculture has reported the Lenroot resolution to the senate, providing for a joint congressional commission of five senators and five representatives to investigate business conditions in agriculture. The committee has also reported the senate packer bill after amending it to give the supervising power to a livestock commissioner to be a part of the department of agriculture. It has been suggested that both of these measures should make use of the federal trade commission and Senator Norris has issued an open letter urging that this be done.

Collective Bargaining

The Volstead bill legalizing collective bargaining by cooperative agricultural associations is still held up by the judiciary committee of the senate. Secretary of Agriculture Wallace has been appealed to in support of this measure and has promised to do whatever is within his power to secure the passage of a measure in aid of cooperative marketing by farmers.

Agricultural News Notes of the Pacific Coast

Northern California

Mendocino County fair will be held at Ukiah, August 7-13.

Humboldt's county fair is to be held at Ferndale August 15-21.

The California International Show will be held at San Francisco August 14-21.

Over 1,600 acres have been planted to peaches in Sutter County this spring.

Operation of the farmers cooperative elevator at Oakland started on Thursday, May 26.

The 1921 potato crop, both early and late, in the Stockton section, will total about 38,000 acres.

Chico, Butte County, has bought the U. S. forestry station at that place, to add to Bidwell Park.

A boys' bee club is the latest organization within the Napa County farm bureau. It starts off with 14 members.

According to Horticultural Commissioner Stabler Sutter County last year produced 40,000 tons of canned peaches.

The Napa County farm bureau has four boys' clubs; a popcorn club, a sow and litter club, a pig feeding club and a bee club.

A group of ranchers on the northern slopes of the Sutter Buttes have petitioned for extension of power lines for securing irrigation water.

The state printer at Sacramento has just completed the printing of 405,000 arithmetics for free distribution to the public schools.

Glenn County farm bureau meetings: Board of directors, Willows, June 11; Codora, 13; Capay, 15; Plaza, 17; Grapevine, 22; Larkin, 24.

The Stockton district will harvest about 7100 acres of onions, though now dumping thousands of sacks of the 1920 crop for lack of market.

Recent rains did some damage to raisin and cherry crops in the Newcastle district of Placer County.

Organization of the Northern California Alfalfa Growers Association was perfected at a meeting held in Sacramento the last of May.

The farmers of Plymouth and Shenandoah districts of Amador County will meet at Shenandoah schoolhouse on June 12 to organize a farm center

A packing house manager at Marysville, Yuba County, says the late spring frosts were a benefit, thinning the grapes and fruit crops, yet not enough.

A cooperative warehouse is to be established at Redding, Shasta County, through the efforts of fruit growers and the Redding chamber of commerce.

The California Dahlia Society announces that official trial gardens have been established at the University of California for testing out new seedlings.

The Sutter County farm bureau intends to hold an annual peach growers contest. The first contest held last year aroused widespread interest, 82 orchards being entered.

Shasta County farm bureau meetings: Inwood, June 11; Clear Creek, 13; Latona, 14; Bella Vista, 15; directors at Redding, 18; Cottonwood, 20; Palo Cedro, 22; Hat Creek, 24; Fall River, 25; Mountain, 26; Millville, 28.

Central California

The Big Oak Flat road into Yosemite was officially opened June 2.

Grading has been completed on Coulterville road into the Yosemite.

Exeter, Tulare County, shipped 119 cars of Valencia oranges this season.

Monterey has been presented with a 20-acre tract to be used for a public park.

Hanford canneries and packing houses expect to start on apricots this week.

Fresno County reports a net balance of nearly $25,000 in its highway maintenance fund.

Bakersfield, Kern County, will acquire nine acres, within the city, for park purposes.

The annual Iowa picnic will be held in Mooney Park near Visalia, Tulare County, on June 14.

The apricot crop in the Hanford district of Kings County is now reported at 75 per cent of normal.

More than 30 herds are entered in the Kings County cow testing association; more than 1,000 cows.

Lindsay, Tulare County, is well pleased with its share of prizes taken at the Anaheim Valencia Show.

The first annual meeting of the California Peach and Fig Growers since their union was held June 7 at Fresno.

The California Bean Growers Association is now sending out its new contract to cover handling of crops of 1921 to 1926.

Twenty-nine farm bureau fire departments have been organized in Stanislaus County with the Modesto fire chief in charge.

The farm center at Hughson, Stanislaus County, has found its community auctions to fill a long felt need in exchanging farm machinery.

A serious break occurred in the Tulare Lake & Canal Company's ditch at Stratford, Kings County, causing loss of thousands of dollars.

The Hughson farm center of Stanislaus County sends out notice that Japanese are not wanted in that section and will not be tolerated.

A great orchard of over 300 acres near Planada, Merced County, is being planted to figs, plums and peaches. The land is the former Fancher estate.

F. A. Seymour of the raisin association says that from his knowledge of the present situation he has no doubt that prices for grapes will hold up close to last year's.

As part of the plan for reorganization of the San Joaquin Valley Milk Producers Association there will be an issue of $200,000 in association certificates running for a term of 15 years.

Fresno growers have contributed generous tonnage of dried fruits, beans, rice and other products to the cargo of the Esther Dollar, which sails from San Francisco on June 12 to relieve famine conditions in the near East.

Women of the Grangeville, Hardwick and Paddock centers of the Kings County farm bureau displayed articles made by them on the occasion of the visit of the farm bureau traveling conference to Hanford. One item of the display was 60 dress forms.

Southern California

Carpinteria bean growers are now replanting fields damaged by the rains.

Almond trees in the Banning-Beaumont section show an unusually heavy yield.

Orange County is already planning for a bigger and better Valencia show in 1922.

Anaheim citrus growers are planning to make the Valencia Show an annual event.

Residents of the Irvine ranch held a community picnic at Orange County Park, June 4.

Beaumont has picked and shipped out most of its cherries. The fruit has been of very fine quality.

The Alfalfa Growers of California will soon hold a series of organization meetings in Imperial Valley.

The famous Elwood Ranch at Santa Barbara sold last week for nearly a quarter of a million dollars.

San Fernando Valley alfalfa growers have formed an association which will affiliate with the state organization.

The Blythe chamber of commerce is heading a movement to make the river crossing at Blythe passable in flood time.

The board of directors of the Imperial Valley farm bureau has outlined plans for a county exchange and marketing system.

Ventura's county fair will be held October 5-8. A. L. Hobson is president of the association and L. P. Hathaway is secretary.

The Palo Verde Valley, Riverside County, is experimenting in hemp culture. It is reported that 400 acres is practically assured.

San Bernardino County farm bureau held its annual meeting and farm picnic June 4 on the Chaffey union high school grounds at Ontario.

Rural route number 1 of the Simi post office in Ventura County has been extended nine miles and will afford delivery to 45 additional families.

Citizens of Rialto, San Bernardino County, held a mass meeting last week to devise a community plan of building houses to supply needs of settlers.

Lemon growers are very much encouraged over the improved prices brought by the hot weather in the East and the fixing of the emergency tariff.

The Mojave River Valley Alfalfa Growers Association was organized last week at Victorville, San Bernardino County. It will affiliate with the state association.

The Yuma Water Users Association has demanded that the Imperial irrigation district destroy the weir at Hanlon's Heading to protect Arizona lands from flood water.

The entire pavement through the desert on the west side of the Salton Sea is expected to be finished the middle of the month and will be thrown open to travel the first of July.

A meeting of apricot growers of the Ventura, Los Angeles, Santa Barbara and San Luis Obispo district was held at the packing house of the association at Santa Paula last week to elect two members to the voting board of the California Prune and Apricot Growers Association.

The Coast and General

The Texas onion crop will run from 38,000 to 40,000 carloads.

Yuma, Arizona, is to have a new postoffice building at once.

The Georgia peach crop is estimated in excess of 7,000 carloads.

The new cooperative creamery at Fallon, Nevada, opened on June 1.

In the Walla Walla Valley, Washington, the beet crop covers 800 acres.

Thrips, after a lapse of several years, are doing much damage about Salem, Oregon.

The Toppenish district in the Yakima Valley, Washington, beet crop will be 100,000 tons.

A Yakima, Wash., cannery will this season handle 500 tons of spinach and 450 tons of cucumbers.

The Yuma, Arizona, Commercial Club is exhibiting two cabbage heads weighing 18 pounds each.

Snohomish County, Washington, will send a carload of local canned milk to the starving children of Armenia.

The 1920-21 cotton crop of Lower California will be nearly 100,000 bales, greatly in excess of early estimates.

The 1920-21 payment on the construction charges of the Salt River Project will be extended for one year.

The 4,000 standard refrigerator cars ordered by the Pacific Fruit Express Company early in 1920 have been completed.

The Oregon Jersey Cattle Club staged its Jersey Jubilee in Tillamook County, June 2-4, making a three day auto tour.

It is reported that a larger acreage of potatoes than ever before is being planted on the Yakima reservation, Washington.

Consul Yost, of Guaymas, Mexico, reports late frosts diminished the expected crop of garbanzos, or chick peas, by 30 per cent.

Apple growers of the Yakima Valley of Washington report 500 carloads of the 1920 crop of apples still in storage in the valley.

Last year the Olalla Berry Growers Association of western Washington marketed 40,000 crates; this season the estimate is for 60,000.

Up to May the Oregon Growers Cooperative Association had sold 8,296,007 pounds of prunes, one fourth to New York, one million pounds to England.

Four hundred and thirty-one carloads of shelled corn were contributed to hungry Europe by the farmers of the United States during the past three months.

The new community building in the Franklin County irrigation district of Washington was built by donated labor and the grounds will be improved and beautified in the same way.

At the recent annual meeting of the Washington Hay Growers Association at Toppenish, attended also by representatives of the Oregon Alfalfa Association, it was decided to establish one central selling association for the two states.

Representatives from railways of the United States and Canada and from nurseries of the Western states have been in attendance at the third convention of the Western Plant Quarantine Board held during the past week at Victoria, B. C.

The Farm Bureau Egg Laying Contest

By Jean A. Koethen

THE California Farm Bureau Egg Laying Contest closed the first half of its third year, April 30, covering a period of exactly 181 days. During this time the high hen, owned by Hollywood Farm, Washington, laid 146 eggs, and the leading pen, owned by J. H. Hanson of Corvallis, Oregon, an average of 125.7 eggs per hen.

When the contest was inaugurated in the fall of 1918 it was a private enterprise, participated in by a few Santa Cruz poultrymen who believed such a contest would stir up more general interest and greater effort for flock improvement in their own community. So great was the interest taken that by the end of the year plans had been formulated by the Santa Cruz County farm bureau and the poultry division of the University of California for a contest which should include poultrymen of the whole state. In this contest, which began November 15, 1919, and closed November 15, 1920, there were 54 entries of ten birds each, and the name, which had originally been "Santa Cruz Contest," was changed to "California Farm Bureau Contest." The final count for the whole flock that fall showed a yearly production of 48 per cent, or an average per bird of 175.5 eggs. Thirty-three per cent of the birds went over the 200 egg mark, while only nine per cent fell below 100 eggs. The ten highest hens produced an average of 260 eggs each.

Housing the Contest

Before this first year of the California contest ended it was evident that such a competition was abundantly worth while. Men whose pens made records began to receive inquiries about stock and eggs. Men who had not entered pens began to wake up to the importance of certified records. This contest, it was easy to see, would be a permanent one, and the next question was that of adequate housing. Business men of Santa Cruz began to realize what the contest meant to them, and with their assistance a permanent testing plant was erected in the summer of 1920 at an expense of $12,000.

The contest building is a full monitor type house 26 feet wide and 332 feet long with a six foot alley through the center. The indoor pens have an area of 160 square feet and the outside runs contain 720 square feet. Three entries (36 hens) are kept in each pen.

Entry Rules

There is an entrance fee of $2 per bird, and each entry consists of 12 birds, only 10 of which are counted as contestants, the other two being put in for use in emergency. Entries may be made between October 15 and November 1, and each pen must be entered for a year. The entrance fee is payable, $10 when the entry is accepted and the remainder any time before the fowls are sent to the contest grounds. The management reserves the right to refuse any entry in which the birds show signs of disease or evidence of cross breeding and does not hold itself responsible for loss by fire, disease, vices or unavoidable accidents, though every possible precaution is taken to prevent such loss.

All birds are fed, housed and handled alike under expert supervision, and all birds are trapnested. All eggs produced are the property of the contest, and all revenue derived from their sale is used toward the expenses of the contest. The entrance fee and proceeds from production are supposed to meet the operating expenses, but the low price of eggs this year has brought receipts down to $200 less than expenses.

California Farm Bureau Egg Laying Contest Headquarters at Santa Cruz

Contest Ration

Dry mash is fed in self feeding hoppers; fresh water is supplied by automatic drips; all grain is fed in straw in the pens. The scratch mixture consists of equal parts by weight of wheat, cracked corn, milo and whole barley. The mash is composed of 240 pounds bran, 180 pounds ground oats, 180 pounds middlings, 80 pounds soy bean meal, 60 pounds high grade beef scrap, 60 pounds fish meal, 30 pounds charcoal and 4 pounds salt.

When they leave the roost in the morning the hens find grain in the litter which has been put there the night before. Dry mash is before them constantly and chopped green feed in hoppers. During the winter barley is the green feed, and during the summer kale and red clover are used. At noon a small amount of the dry mash is fed moistened in troughs. About two o'clock oats sprouted till they are one-fourth inch long are fed. An hour before dusk grain is fed in the litter. Including the dry weight of the sprouted oats, from 10 to 12 pounds of grain is fed per day to 100 hens.

Electric lights are used in winter. They are turned on by a time clock in the early morning, at four o'clock when the days are shortest and a little later before and after this period.

All the work of caring for the birds is done by one attendant who is relieved one day in the week. Some extra help is hired for special cleaning, but the regular attendant is able to do nearly all that is required, trapnesting, keeping records, and doing whatever is essential to health and production.

Value to Entrants

"What do those who enter birds get out of such a contest?" is a question that is asked not infrequently. First of all, there is the advertising value which for a breeder who sells stock and eggs is enormous. Farmers and poultry people everywhere are looking for stock with a record back of it and are willing to pay for it. In my visits to ranches I have found several poultrymen who were sending to the Oregon agricultural college for their foundation stock and paying from $2 to $3 an egg for settings. Why? Just because they believe that the Oregon people are a little ahead of California when it comes to breeding for eggs. This is not a pleasant truth to Californians. Perhaps it is not a truth, but only a belief. Anyhow, it shows what progressive poultrymen are willing to pay for stock they believe in.

But such stock must be vouched for by a competent authority. It is not enough for the individual breeder to say, "This hen laid 250 eggs in her pullet year," or even to show his private record as proof. The record must be kept by a disinterested party, and this is what the California farm bureau is. Men whose hens make a record in such a contest as this have proof no one can question and are sure to have a big demand for stock and eggs at very profitable prices.

In addition to advertising value, cash prizes and cups are given, so the entrant need fear loss only in case his hens are such poor producers that they win neither prizes nor honorable mention. If our hens are not profitable the sooner we find it out the better, and no poultryman need fear the stern testing of the California contest.

The 1921-22 contest will begin on the first of October, and entrants are expected from all over the United States as well as from across the water.

Traveling Farm Bureau Conference

By Robert W. Hodgson

SINCE 1917 it has been customary in connection with the annual conference of farm advisers for the agricultural extension service to stage a traveling conference of farm bureau representatives and extension workers, three delegates from each county farm bureau attending as the guests of the agricultural extension service staff assigned to that county. The purpose of this traveling conference is primarily that of studying extension activities in agriculture as conducted by the college of agriculture and United States department of agriculture cooperatively through the medium of the various county farm bureaus. Incidental to these conferences much else is seen—the agriculture of the part of the state visited, the rural development to be found there and many other matters of agricultural interest. But the object of the traveling conference remains essentially that of studying the most successful methods for the improvement of agriculture and country life.

This year a departure was made in that instead of immediately following the conference of farm advisers held in March the traveling conference was not staged until spring activities were well under way, the dates being May 23 to 28 inclusive, the purpose of such postponement being to permit of the trip being held at the best time for studying the results of field tests and demonstrations. This year's conference itinerary covered the San Joaquin Valley, it being just four years since the last conference trip through this part of the state. During this period the farm adviser-farm bureau movement has made a notable growth throughout the state, the ten counties represented in 1918 now having grown to 40, with farm advisers at work in 37.

Starting from Berkeley Monday morning, May 23, at 8:30, the procession of 43 automobiles, carrying some 160 persons, traveled during the week some 600 miles and studied agricultural extension work and farm bureau activities in nine counties, ending the conference with a banquet held in the Hotel Southern at Bakersfield, Saturday night, May 28. Guests of honor accompanying the party during all or part of the trip included President David P. Barrows of the University of California, Acting Dean Walter Mulford, director of the experiment station, C. M. Haring, W. H. Walker, president of the California Farm Bureau Federation, with Secretary W. H. Heileman and R. N. Wilson, secretary of the agricultural legislative committee.

Listed by subjects the demonstrations and farm bureau projects emphasized during the week included soils, fertilizers and cover crops, field crops, irrigation and drainage, deciduous fruits, citriculture, pest control, viticulture, animal husbandry including dairying and poultry raising, marketing and purchasing, home improvement, community improvement, schools and education, agriculture clubs, farm management and agricultural economics, and farm bureau organization and program of work.

Of particular interest were certain test and demonstration plots and certain features of farm bureau and agricultural extension work which will be briefly reviewed here. It was evident that the fertilization of alfalfa is now a subject of interest to farmers, a number of test plots on this subject being visited. Some rather striking results were reported showing that su-

(Continued on Page 772.)

Fresh Grapes From France

By R. L. Nougaret

FROM time to time during the past two months the state department of agriculture has been receiving news items to the effect that agents from Europe, France being most frequently mentioned, were looking up the market situation in the East with a view of shipping fresh grapes across the Atlantic and taking advantage of the high prices that California grapes, especially those of the wine grape varieties, have been bringing during the past two years.

With foreign exchange as it exists at the present time in favor of the United States as against most of the European countries, especially those of the allies, the foreign grape industries might derive great advantage in shipping their products and competing with California grapes since handsome profits could be realized even when selling at a lower price than that for which California grapes can be landed in the East at only a fair profit. Such a condition would create very serious competition. But from an authoritative source information has just been received that casts much doubt upon the probability of such a foreign competition, at least for this year.

France has experienced a general damage to her vineyards by severe frosts, fully as severe as that sustained by California vineyards from the same cause. During the month of April on the dates of 16-17, 17-18 and 19-20, the two last dates being the most severe, the vineyards in different localities of France, according to reliable reports of the French viticultural periodicals, "Progres Agricole and Viticole" and "Revue de Viticulture," were affected as follows:

"A heavy frost has damaged almost all the vineyards of France, causing in some instances extremely important damages and again almost nil in other localities according as to how vineyards are situated and conditions of advanced vegetation. Vineyards of the eastern portion of France seem to have suffered most. General and important damage sustained by the vineyards of the Champagne district, severe damage to those of Burgundy and the Department of Soane-et-Loire. Nothing remains of a very advanced and promising vegetation; all the swollen buds have been frosted in the district of Chalons, causing a loss of a part of the crop. In the Department of the Ain, in the Savoy and the Bejolais districts, in several communes (subdivisions of departments) the vineyards of higher altitudes have been affected.

"The vineyards of the Departments of Ardeche and Gard have sustained quite a loss in the valleys and even others in higher situations have been affected; some vineyards have been completely frosted back. The northern portion of the Department of l'Herault has suffered in a like manner as the Department of the Gard, the Department of Aude has suffered but very slightly, while the vineyards of the Tarne-et-Gorone have suffered important damages. Throughout all the southwest considerable damage due to frost has been reported, the Gironde district has been hit hard in places and that of the Charantes has been likewise affected. Sections of the latter have been seriously hurt. The vineyards of the Department of Loir-et-Cher and of the Indre have been very seriously affected."

From this, even if the reports are somewhat exaggerated, as often happens, it can be concluded that the grape crop of France will be very materially reduced. Prices of grapes will be maintained at a higher figure and there will be but little or no inducement for seeking new markets on the Atlantic coast. "Later reports resulting from more accurate and detailed observations confirm the earlier ones, and if anything the damage due to frost is more severe than at first realized. In portions of the central northern parts of France the cold has been so severe that it is feared some of the vines in the most affected locations may have been killed. Of all the damaging frost years experienced by the vineyards of the Champagne districts of France recorded as far back as 1840, that of 1873 is the only one which is believed to equal that of 1921. This points out what may be expected as a grape crop this year in France. Other grape producing countries of southern Europe are most likely to be similarly affected, more or less, but as to this precise data are still lacking."

Further information has been received telegraphically through the U. S. bureau of markets to the effect that the grape crops of Spain and Jugo-Slavia have been more or less damaged by frost. A report also states that the vineyards of southern Europe have suffered in various degrees of intensity from a cold wave covering a period of several consecutive days, from April 16 to 21, inclusive. Although no specific report has been received relative to Italy, it is probable that the vineyards of that country are included in the general report and have suffered some losses from the same cause.

These reports in the aggregate should dispel, at least for this year, any anxiety that the grape industry of the state may have entertained concerning the possible foreign competition of fresh grapes from Europe. They should also help maintain a firm market and sustained high prices for the raisin trade.

Wines for non-beverage purposes, which at the present time are stocking the wineries to almost their full capacity, should find more ready sales by foreign importations from Europe being restricted because of a reduceed supply.

$645

CHEVROLET

"For Economical Transportation"

At the new price, Chevrolet Model "Four-Ninety" touring car is the lowest priced, fully equipped, quality automobile on the market.

It places comfortable, convenient and dependable motor transportation within the means of everyone.

"Four-Ninety" features:

Transmission: Selective type, hand control, 3 speeds forward, and reverse
—
Electric starter
—
Speedometer
—
Tire carrier
—
Side curtains
—
Electric lamps
—
Demountable rims
—
License holder
—
Complete tool equipment
—
Electric horn
—
Extra rim
—
Fabrikoid Top

GAS TIGHT TENTS

The Riverside citrus experiment station has been testing out gas tight tents in the field for a year and a half, and the results of this work indicate that fully 50 per cent of the cyanide may be saved by their use. The average cost of cyanide per tree with the tents in use at present is about 20 cents. This amount may be cut in half with gas tight tents. If a tent covers 800 trees in a season the saving in cost of cyanide will be $80 a season for each tent in use.

INSPECTING ALFALFA WEEVIL

County horticultural commissioners representing many alfalfa producing counties of California, together with officials of the state department of agriculture, left Sacramento June 3 for Reno, Nevada, to conduct a survey of the area infested by the alfalfa weevil, that according to recent reports now involves over 1,000 acres and has thus become a distinct menace to the alfalfa industry of California, owing to the facility with which it could be introduced in shipping from the infested region.

W. H. Fleet, manager Rancho Seepe, Ventura County, in a talk before the citrus institute at San Bernardino, 1921 meet, said: "One animal consumes on an average about 38 pounds of food per day, in round numbers seven tons yer year. Making an allowance of 30 per cent for waste, leaves five tons per animal a year. Figuring the value of this at $5 per ton delivered equals $25. Assuming an animal works 250 days a year, the value of fertilizer for one day is ten cents per animal."

It's Rubber and It's Porous

THREAD-RUBBER INSULATION — STORAGE BATTERY — Willard

This trade-mark tells you that the plates in your battery are insulated—not merely separated. Willard Threaded Rubber Batteries are selected by the best brains in the automobile business as standard equipment for 173 makes of cars and trucks.

In your storage battery are certain metallic plates used in producing the electricity. They have to be kept apart or "insulated" from each other. Why, then, has not rubber—the *universal* insulating material—been generally used between the plates of automobile starting and lighting batteries? Because rubber insulators, as used in these batteries (unlike insulation in other electrical products) must be *porous*.

The only form of porous rubber suitable for this purpose is Willard Threaded Rubber. It lasts the life of the plates and reinsulation is therefore unnecessary, saving you time and money. Knowing this the builders of 173 makes of cars and trucks use only Threaded Rubber Batteries as original equipment. Can you do better, when you need a battery, than to follow their judgment and insist on Threaded Rubber?

You can buy the Willard Threaded Rubber Battery of any of the dealers in your territory listed below. They all give authorized Willard Service:

(Continued from Page 769.)

perphosphate and lime and sulphur have given the best results, in certain instances doubling the yield.

Mariout barley demonstrations were seen in a number of counties, the marked drouth resistance of this variety having been conclusively demonstrated, although shortness of stalk has in some instances prevented satisfactory harvesting.

The long system pruning for deciduous fruits came in for its share of attention, a number of demonstrations being studied. The universal statement was favorable both as to increase in yield and resistance to frost and other adverse conditions.

The work of the division of viticulture in shaping the cultural practice in the handling of vines was apparent in the large number of vine trellising and pruning and management demonstrations inspected, also in the number of cooperative demonstration vineyards seen.

Special interest was manifest in agriculture club work, particularly with livestock. The splendid showing made by the Stanislaus County calf club with its pure bred Holstein calves and the excellent work of the Kern County high school agriculture club with Poland China hogs did much to demonstrate what agriculture club work may be made.

Other demonstrations of outstanding interest were those on poultry culling where the year's summary shows most excellent results and the unanimous experience as to the benefits from home demonstration work.

Among the outstanding impressions of the trip as seen by the writer were the rapid expansion of the grape industry, together with the adoption of better cultural methods, the rapid development in the fig industry, the seriousness of the alkali problem, the rapidly expanding acreage coming in under irrigation districts, and the great development occurring along the lines of cooperative effort in community improvement as well as in the marketing of farm produce. Of particular interest to Southern California delegates was the function of the local farm center as a vehicle for the expression of community activity.

Points of special interest visited or seen in the course of the trip included the terminal elevator, controlled by the California Farm Bureau Elevator Corporation, on the Oakland water front, the Delhi Land Settlement Colony, the 12,000 acre Forkner fig gardens near Fresno, the famous 5,500 acre Kearney vineyard farm owned by the University of California, and the 2,500 acre Hoover Ranch near Wasco, Kern County.

There was much of good fellowship and acquaintance developed during the six days the party spent in the trip, changing cars and experiences with every stop. It is perhaps not too much to say that the acquaintance occasioned by previous conferences of this sort did more to bring the California Farm Bureau Federation into existence than any other one thing. And these conferences will likely do as much to continue to build up a working relationship between the different parts of the state as anything else. It is indeed difficult to estimate the value of such conferences. Certain it is, however, that they mean much for the future of California agriculture.

Needless to say, true California hospitality was extended to the party at every stop made, the best possible testimony to the high regard in which the farm adviser-farm bureau movement is held in the great farming districts of the state. And last, but not least, it was clearly apparent that every farm bureau delegate and extension worker returned to his county with a greater appreciation of those things near at home than ever before.

International 8-16
The Adaptable Farm Power

ON sun-baked slopes, in rain-soaked valleys, on rolling uplands and level plains—everywhere you will find **International 8-16 Kerosene Tractors** working efficiently, converting cheap kerosene into valuable farm power.

Plowing, disking, seeding, cultivating orchards, hauling heavy loads on road and farm, pulling stumps, dragging roads, drawing mowers, hay loaders, grain harvesting machines; threshing grain, baling hay, cutting ensilage, sawing wood—on all heavy farm tasks where dependable power is required either at the drawbar or belt pulley **International 8-16 Kerosene Tractors** are rendering satisfactory, year-'round service.

The **International 8-16,** because of its light weight, snug compactness, ease of control, generous reserve power above its rating for emergency pulls, three speeds forward, economical operation and general fitness for diversified service, is highly popular with farmers in every branch of agriculture.

Fifteen years of tractor building experience and over three-quarters of a century of general farm machine success, backed by a broad-as-agriculture reputation for fair dealing, good quality and dependable after-sale service—these factors are your assurance of satisfaction when you buy an **International 8-16 Kerosene Tractor.**

WHITTEN ON SOUR SAP

During May Dr. J. C. Whitten made observations in several northern counties where "sour sap" has been working havoc in deciduous orchards. Investigation is still under way and definite conclusions have not been reached but Dr. Whitten makes the following recommendations:

Plant trees no deeper than they stood in the nursery. Most fruit trees are planted too deep.

Sour sap seems to be associated with hardpan or periods of surplus water in the soil. Good drainage should be emphasized. A furrow may be opened, in early winter, on either side of the tree row, to carry off surplus winter rains and prevent the soil from remaining saturated for prolonged winter periods. Numerous instances have been observed where open irrigation ditches have drained adjacent tree rows during winter. Trees in the drained soil have escaped sour sap, while those in soil saturated with winter water, farther from the ditch, have suffered badly.

If there is a thin layer of impervious hardpan with drainable sub-soil below, the hardpan may be shattered with dynamite or a subsoiler to afford drainage. If hardpan is continuous it is not wise to blast openings in it that will form water tight "pot holes" below.

Trees that made steady growth during the past summer, ceased length growth moderately early and ripened their wood thoroughly for winter, show less sour sap. On the other hand, trees that show intermittent growth, especially late autumn growth, and failed to ripen their wood for winter show more sour sap. It is advisable to plan tillage and irrigation so steady summer growth will be maintained to midseason when the growth should slow down and the wood ripen for winter.

Spray for red spider or leaf insects and diseases so the trees will carry healthy leaves until normal times for leaf shedding. Leaf injury or partial leaf shedding in summer is liable to be followed by a late autumn growth just when the trees should be ripening.

Whitewash the trunks of trees in December to reflect heat from the growing layer on sunny days. The coloring matter in the bark of exposed tree trunks absorbs heat enough to raise the temperature of the growing layer 35 degrees Fahrenheit above atmospheric temperature. As soon as the sun goes down the tree cools rapidly to atmospheric temperature which may be freezing or below at night. Whitewash reflects the heat, keeping the growing layer a little below air temperature during the day.

LABORATORY OF FRUIT AND VEGETABLE CHEMISTRY

E. M. Chace, chemist in charge of the citrus by-products laboratory of the United States department of agriculture, located on Anderson Street, Los Angeles, writes as to increase in scope and change in name as follows:

"Owing to the increased scope of the activities of the citrus by-products laboratory, the secretary of agriculture has authorized a change in the title, and it will hereafter be called the 'Laboratory of Fruit and Vegetable Chemistry.'

"When it was established in 1913, the greater part of the work was connected with the citrus by-products investigation. Since that time, other investigations pertaining to the maturity of fruits, the inheritance of composition in citrus fruits and the curing of lemons have been undertaken. Under the circumstances it seemed that the old title was inadequate and the present change to be desired."

GARDEN SLUGS

Garden slugs are serious and destructive pests on the Pacific Coast. They are voracious, reproduce often and in large numbers, and feed upon nearly every variety of plant life. Control practices usually adopted against insect and other animal pests are of little use in repressing garden slugs.

Extensive experiments conducted by Lovett and Black, of Corvallis, Oregon point to the efficiency of the following poison bait: Calcium arsenate, 1 part

(by weight) to 16 parts of chopped lettuce. If lettuce is not available use cabbage, kale or clover. The poisoned bait should be scattered in small heaps at frequent intervals over the slug infested area. Spraying foliage with liquid Bordeaux mixture or dusting with commercial dry Bordeaux mixture also has met with success.

VALUE OF LONG PRUNING

Dr. J. C. Whitten wrote an atricle in the Monthly Weather Review, published at Washington, D. C., from which we glean the following touching upon the influence of pruning on the resistance of fruit trees to cold:

"The general condition of a plant at a given time, the degree of maturity or quiescence, the quickness of growth, have all a more or less marked influence on the plant's resistance to unfavorable surroundings. Investigations made at the Missouri agricultural station have shown that sap concentration is least (minimum sugar content) during the periods of rapid growth in spring and at the beginning of summer. The suspension or slowing of growth brings about an ever increasing concentration of sap, with a rise in reserve stores.

"The earlier that growth stops in autumn, the greater will the concentration of sap be and the greater will the quantity of reserve material be. On the other hand, as the degree of concentration increases, the freezing point becomes lower and thus the plant is able to stand lower temperatures than would be the case if the juices were weaker. For example, in a peach orchard, vigorous growth of branches continued up to the first autumn frosts. The following spring the blooms were killed in a single night by a fall of temperature to 2.7 degrees C. In another orchard in the same district growth stopped much earlier, with the leaves kept healthy and active until the first frosts. The following spring the flowering buds were very resistant to frost.

"With the old pruning methods, trees underwent every winter a very severe pruning which brought about a vigorous growth of shoots at the ends of the pruned branches. These shoots continued lengthening and producing leaves all summer, thus preventing the concentration of sap and the storage of reserve material. With the new pruning system, on the other hand, the main branches are untouched; they are only cleared every year by the removal of useless side branches, so that growth stops early. These branches and their leaves, of slow growth, have compact tissues, evaporate and transpire very little and thus keep their sap concentrated. In addition, the leaves do not remove moisture from the fruit during dry seasons. By this pruning system not only is resistance to low temperatures obtained, but also resistance to drought."

JAPANESE STRAWBERRY VENDERS IN TOILS

The state department of agriculture reports: "Eight Japanese strawberry growers from various parts of the state are in the Oakland city jail charged with violating the standard packing laws of the state. D. P. T. McDonald, deputy horticultural commissioner of Alameda County, swore to the warrants before Judge Mortimer Smith.

"The Japanese were traced through boxes of strawberries placed on the Oakland wholesale markets. These boxes, it is alleged, were packed with a top row of fine ripe berries while the bottom rows were composed of overripe and diseased berries.

"Repeated warnings have been sent to the growers, declared Fred Seulberger, county horticultural commissioner, and every effort has been made to compel the growers to comply with the laws before the warrants were issued. Several hundred chests of strawberries were seized by the arresting officer shortly after the warrants were served.

"Commissioner Seulberger requested that the bail in each case be set at $1,000. In making this request he said every effort will be put forth to rid Alameda County of this type of berry packing and he will appeal to the courts to impose a heavy fine."

Gill
One-piece Piston Rings
last longer than others

because: through every process of manufacture they are handled with the utmost consideration and care. They are *individually* cast from a special gray iron that is heated not too hot, nor cooled too cool. They have an unusually *close texture* that cannot be disintegrated by the heat, or stress and strain of piston ring service. They are *all* subjected to a series of exacting tests. They are wrapped in *moisture proof* paper for packing. Precision prevails throughout the Gill plant.

Electric Power and the Raisin Industry

By Wylie M. Giffen, President, California Associated Raisin Growers

IN this great West of ours electricity is playing a part so important that he who does not recognize it as the backbone of all industrial expansion must be short sighted indeed. But to develop these resources of ours we must have power, and of power there is an inexhaustible supply awaiting our command in our mountain ranges. Coal mines may yield their last ton to greedy furnaces, forests may bow to the axe and the wood supply vanish like the mist, but nature will continue on to the end of time piling the eternal snows on the mountain sides, sending the streams that mean power down through the canyons, ready for their harnessing at our hands.

Electricity has played an important part in the development of the raisin industry. It is beyond question destined to play a far greater part in the industry's future. Looking over the fertile acres surrounding Fresno where the jack rabbit, the horned toad and the ground owl lived precariously only a few years ago, I marvel at the wonders wrought by irrigation and I am impressed with the amount of water pumped out of the very ground itself by electricity. And when I visualize the possibilities of the West that depend upon and must result from hydro-electric development, when I survey what electricity has done in promoting efficiency, economy and cleanliness in the manufacturing of our own product, I cannot but say that as develops the hydro-electric industry in the West so develops the West itself.

Sitting in my office here in Fresno, I see in my mind's eye a map of the West beyond the Rockies. I see its mineral wealth, its timber, its fisheries, its agricultural products, its citrus fruits, its acres of apple orchards, and here, stretching out beyond Fresno as far as the eye can reach, its acres upon acres of fertile raisin land. Throughout the West I see here and there factories springing up, either as assembly plants, fostered by Eastern enterprises, as branch factories, or as new plants to meet local needs for construction material, specialized mining machinery, and so on. I see the possibility of coordinating a great section of our country so that it will have an industrial program as a whole, and I see electricity playing a master part in this because it can furnish energy for light and heat and motive power.

Electricity is a civilizing influence in the world. The whole fabric of industry here in the West through this giant motive power can be moved forward. The California Associated Raisin Company has proven to its complete satisfaction that electricity makes possible a lower cost and cleaner product. Electricity has proven essential to irrigation of much of our valley land whereon are produced the grapes from which our raisins are made. Furthermore, in the raisin packing factories there is a tendency to take over more and more the processes from hand operation to the operation of the method electrical, and it is our hope eventually to have the fruit go through "untouched by human hands."

I will cite one or two instances of how electricity has helped us. By the installation of electrical driers a saving in time of from four to five hours has been accomplished and the services of from ten to 15 men saved in one of our factories in Fresno. With the taking over of the packing house and its complete electrification, the services of more than 100 girls have been dispensed with. By means of belt conveyors and elevators electrically operated the fruit is taken to upper stories and transferred to other buildings, and a so-called "elephant truck," which swings constantly from side to side of an elongated hopper, ingeniously secures the even distribution of the raisins on the conveyor. From here they are seeded and packed. There is always danger of nails or other iron refuse being included among the fruit, which would endanger the machinery of the seeder as well as prove objectionable if not caught, and a system of magnetic pulleys has been devised by which practically all metal is extracted as the raisins pass between the two buildings.

I could go on indefinitely describing to you the economic processes open to the method electrical in the operation of the raisin packing plants, but I think I have said enough to show why it is that in 1920 Fresno County alone produced 122,500 tons of raisins for which some $36,750,000 will be received by the growers when final payment is made, and why it is that this association has a membership of 12,000 growers and handles more than 92 per cent of the raisins grown in America.

PERMANENT "BRACES" FOR TREES

Deciduous fruit growers might be interested in the method which the undersigned has hit upon for supporting branches heavy with fruit.

A single No. 16 gauge galvanized wire circles the tree at or a little below the level of its widest spread. Staples are driven into the several limbs on the side toward center of tree, the wire is passed through the staples and ends twisted together. Each limb so stapled helps to support all the other limbs. Low limbs below the wire belt requiring support may be tied up directly overhead to the wire. The plan works out fine in actual practice, the more symmetrical the tree the better it works. The center of the tree is thus left free of obstructions when standing in the crotch or head of the tree to pick fruit or prune.

The wire when once installed remains indefinitely and the annual expense of propping is saved, except in occasional cases where the unsymmetrical form of the tree requires the use of a few props. It is well, before wiring the tree, to prop the limbs temporarily in the desired position to facilitate the work.—F. L. Douglas, Covina.

SHORTAGE OF FRUITS PREDICTED

The state agents of the bureau of crop estimates, United States department of agriculture, report that there will be a short fruit crop this year. The shortage will be fairly general east of the Rocky Mountains, except in portions of Michigan, New York and New England. The reports refer particularly to stone fruits, such as cherries, plums and peaches, but also indicate that there will be a material shortage of apples and grapes, though not as extensive as the shortage of stone fruits. It is too early, the statisticians say, to make an estimate of the probable yield of blackberries and raspberries. With the shortage of stone fruits it is expected that the fruit supply for domestic canning purposes will be limited in many sections. While considerable frost damage has occurred in some parts of California, the general outlook for deciduous fruits on the Pacific slope is still regarded as good.

SHIPPING POINT INSPECTION

From a survey of the experiences of the new shipping point inspection service of the state department of agriculture and recapitulating the favorable attitude of producers, shippers, transportation companies, and consumers, it may be safely stated that the service is welcomed by all and that it will become a powerful factor from many angles in stimulating the production and marketing of wholesome fruits, vegetables, nuts and other products of farm and orchard. In addition, it will unconsciously serve to raise the standard, in individual cases of certain recorded orchard and farm brands and trade-marks.

CARGOES OF CITRUS FRUIT

Carrying a total cargo of approximately 60 cars of citrus fruits, making it the largest shipment for any similar period, three steamers sailed from the port of Los Angeles during the week ending May 14 bound for Eastern and European markets.

Twenty cars of Valencia oranges were shipped by the California Fruit Growers Exchange via the Panama Canal on board the S. S. Moerdyk, a refrigerated steamer of the Holland-American Company, May 13. Six thousand boxes of this cargo are destined for London and 2,000 boxes of the oranges are scheduled for Rotterdam. This is the first direct all water shipment of oranges ever sent to Rotterdam. Bound for New York, the S. S. West Isleta left Los Angeles harbor on May 11 carrying a shipment of 12 cars of Valencias and 21 cars of lemons. This shipment is proceeding under ventilation. That the New York trade is enthusiastic over the success of the all water shipments through the Panama Canal is evidenced by the ready sale with which previous shipments of citrus fruits have met upon their arrival at this port.

"A new ray of hope has entered into the romantic task of feeding New York's hungry millions," is the way

one of New York's large daily newspapers comments upon the experiments of the California citrus shippers.

According to the latest reports from New York, there were sold in this market during the month of April 21,550 boxes of California lemons shipped via the all water route by the California Fruit Growers Exchange. In addition 23,687 boxes of lemons shipped by rail were sold during the same period.

The fact that during April only 3,137 more boxes of lemons shipped by rail were sold in the New York market than those shipped by water is indicative, say members of the trade, that all water shipments of citrus fruits have marked a new epoch in the history of transportation.

CITRUS EXPERIMENT STATION

By Ernest Braunton

SOME time ago a considerable number of visitors were shown over the grounds, old and new, of the state citrus experiment station at Riverside. The initial gathering at the administration building was divided into three groups and conducted through the orchards by Acting Director Barrett, Dr. L. D. Batchelor, and Professor R. S. Vaile. A total of 17 persons are now employed at the station.

Some curious and interesting trees and fruits were seen. One of the first lots encountered consisted of four year old trees of sour stock from Florida, Africa, and Brazil, also trees of greater age of Poncirus (citrus) trifoliata. There were trees loaded with the huge round Hawaiian pomelo, shaddocks and citrons of many shapes and sizes. Several young trees were bearing the Samson Tangelo, a cross between the Dancy Tangerine and the pomelo, as its name implies. The fruits are globose in shape, about two-thirds as large as a Navel orange, with a very thin skin, few seeds, and a flavor, in the estimation of the writer, second to no citrus fruit he has tasted. They are full of juice, too, with very little "rag." A fine fruit for home use and bound to become popular—better plant a tree of tangelo.

There is a young trial orchard of 50 acres four years old. Up to date all have received the same treatment. Next year the differential treatments will be begun. The trees are set out in linear blocks of nine with "guard" trees on all sides. There are five such blocks for each treatment, or a total of 45. This allows for all possible range of soil, moisture content and factors beyond control of human agencies. Blackeye beans have been grown over all and the bean straw replaced about the trees after harvest. This four year program will be broken by a crop of melilotus and then Whippoorwill peas. No other fertilizer has been given. The first two years the trees did not seem to be thriving vigorously but in the third the effect of the bean straw was plainly noticeable, and now the orchard is second to none of its age in the land. Though there are about 300 varieties and strains on the station grounds the experimental treatment plots consist of Navel and Valencia oranges and Eureka lemons, each on four seedling stocks: sour, sweet, trifoliata, and pomelo. The fertilizer experiments with this great variety of blocks of trees will begin next year. The most elaborate records possible have been made up to the present as a basis upon which to build the records of the coming differential fertilizing.

ORANGE SALES AGENT STUDIES FOREIGN MARKETS

For the purpose of studying foreign markets and the possibilities of marketing greater quantities of citrus fruits abroad, D. C. King, orange sales agent for the California Fruit Growers Exchange, will make a first hand investigation of the more important European markets, leaving Los Angeles on June 16.

Mr. King will visit London, Liverpool, Rotterdam, Antwerp, Glasgow and Paris for the purpose of acquiring personal information as to the future of citrus fruits in these and various other large European centers of population.

With the promise of at least nine huge refrigerated liners for the transporting of citrus fruits to Europe next year, as compared to only three that have been used up to this time to carry California oranges and lemons across the Atlantic, the various shippers of the exchange felt the necessity of securing accurate data on the estimated supply and demand that could be expected from these markets. One fruit broker in London has requested that the exchange ship ten carloads of oranges a week to him during the summer season for general distribution.

CROP REPORTS

J. W. Mills, Farm Adviser Solano County

Almonds: 10 per cent.
Apricots: 15 to 20 per cent.
Cherries: 75 per cent.
Peaches: 50 per cent.
Pears: 30 per cent.
Prunes: 80 per cent.
Grapes: 90 to 100 per cent.

Oregon Growers Report

Up to June 1 fruit crop conditions in Oregon were as follows, according to advices received by the Oregon Growers Cooperative Association:

Apples: Rogue Valley has prospects for big crop, double that of one year ago. Umpqua Valley will have the heaviest crop ever shipped. Willamette Valley has prospects of big crop of good quality and large sizes.

Cherries: Umpqua Valley about 50 per cent crop. Willamette Valley estimates are from 60 to 70 per cent.

Pears: Rogue River Valley, about three-fourths of last year's crop. Umpqua and Willamette Valleys, about same as last year.

Prunes: In the Umpqua Valley Italians promise above the ten year average, but spotted. Petites, setting less than normal. In the Willamette Valley river bottom orchards promise fair crop with other orchards having light crop.

As a whole Oregon will have an extra heavy apple crop, average pear crop, cherry crop somewhat lighter than last year, and about 50 per cent prune crop.

The U. S. department of agriculture recognizes the fact that the Northwest will have a heavy fruit crop. A recent bulletin says: "Prospects for the fruit crop in general are quite favorable in the far Northwest. Practically all stone fruits and early apples have suffered a severe loss in the Central and Atlantic Coast states. The crop of late apples in these states will depend on the size of the June drop and a heavy drop is feared. The outlook for a berry crop, especially blackberries, is quite favorable for the country in general."

BERGTHOLDT PLAN

The Pioneer Fruit Company gives heartiest endorsement to the Bergtholdt plan in a letter to Mr. Bergtholdt, from which we quote:

"The potentialities of your plan would in a few years make California by far the richest state in the Union. Your plan is founded on common sense and easy of accomplishment. All it needs is the united efforts of those who will reap the richest reward. We can see without any stretch of the imagination that:

"It means hundreds of thousands more acres planted and producing.

"It means hundreds of millions more money to Californians.

"It means a doubling of our population and wealth in a few years.

"It means greater prosperity for every person in California.

"It means, Mr. Bergtholdt, so many big things for California that we hesitate to mention them.

"Your plan is big enough to command the active support and campaign of every chamber of commerce, newspaper, publisher, merchant, banker, grower and shipper of California.

"Your plan is for the benefit of all, and anything that is for the benefit of all the people is bound to be successful, and California some day will owe you a debt of gratitude. — Yours for success, Pioneer Fruit Company, by Geo. W. Bisbee, president."

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department..

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Avoiding Probate

Husband and wife have limited amount of property, real and personal, in this and other states. Each, having heirs, desires to give each a power of attorney covering all of this property so that in the case of the death of either the other can take it all. Would this be valid?—Subscriber, Palm City.

A power of attorney is merely an appointment of an agent. The authority ceases with the death of the principal; consequently, such arrangement would be absolutely invalid. The method of probate of estates has been established out of the wisdom of the ages and any variation from that rule is always attended with the risk of litigation. It may be that if you go to a local attorney matters may be satisfactorily arranged, but such methods are never recommended.

Water Contract

A large tract of land with a well is subdivided and the parcels sold under contract wherein it is provided that water will be piped to each lot. The advertisements state that a mutual water company will be formed and the water furnished at a stated price, or, if the purchasers desire, a public utility system will be established under rates to be regulated by the railroad commission. The promoter of the tract now seeks to form a stock company, retaining the majority ownership and selling stock at a high price and making a high charge for water service. He refuses to furnish water unless this stock is purchased. What are the rights of the parties?—Subscriber, San Gabriel.

The particular action which might be taken would largely depend upon the exact reading of the contracts and advertisements, but very probably a lot purchaser would have an action either in recission or for damages for the misrepresentations in respect to the water system. It would undoubtedly seem that the owner could be required to furnish the water at the stated rates. There is the one element of the alternative offer which might render this uncertain.

Trust Deed

What is the time required to foreclose a trust deed? Can a deficiency judgment be rendered in such foreclosure?—Subscriber, El Centro.

A trust deed is not foreclosed by court action. The term of the trust deed itself usually states that the trustees shall advertise the property for sale for default of the trustor for a certain time—usually 30 to 60 days. On sale, the amount for which the land is bid in is credited on the note. If the property does not sell for sufficient to cover the note the note is then turned over to the creditor who may bring suit against the maker for the balance which remains unpaid.

Homestead—Mineral Claim

I have completed my proof upon homestead claim in manner satisfactory to the government, made final proof and payment, and am now awaiting the issuance of patent. Party states that there is oil on this land. What protection have I? Must an oil well be established and the fact that there is oil there proven before a mineral claim would hold good? — Subscriber, Rosemond.

In the case of an entryman who has done all which the law requires and made final proof, the government holds the legal title to the property solely in trust until patent is issued, subject, however, to its right to cancel this patent for fraudulent entry or subsequent non-compliance with the laws upon contest. If the land was agricultural land, containing no reservation of mineral rights, it would then seem that no oil prospector would have any right to enter thereon. The usual rule in respect to oil matters is that such are considered as placer claims and it is necessary to make actual discovery of the oil. This, of course, necessitates the entry upon the land and drilling of the well. Lately, this rule has been to a certain extent changed by the rule of insurance of prospective permits, which gives the holder of this permit the exclusive right for not exceeding two years to prospect for oil or gas upon the lands wherein the deposits belong to the United States. Such permit is issued for only a definite tract. Where land has been entered as agricultural land wherein mineral rights are reserved, the entryman is given the preference right to a permit.

Community, Separate Property

What is the rule for classifying property as community or separate?—Subscriber, Upland.

The code definition of separate and community property is as follows: "All property owned by either of the spouses before marriage and that acquired afterwards by gift, bequest, devise, or descent, with the issues, rents, and profits thereof, is separate property of the respective spouses. All other property acquired after marriage by either spouse or both is community property."

Inheritance Tax

A single man dies leaving an estate of $26,000 to be divided equally among a brother, a nephew, and a nephew's son. What is the state inheritance tax that each heir would be required to pay?—Subscriber, Riverside.

The state inheritance tax would be approximately $200 each. The federal inheritance tax touches only estates of $50,000 or more.

Deed in Escrow

My wife and I have made a deed of real property to my two children and placed this deed in escrow to be conveyed at our death. Can an additional clause be inserted in the deed, conveying money in bank, or can a separate deed transfer such money? Property is homesteaded. In case of the death of either or both children, can the name of the deceased be stricken from the deed?—Subscriber, Hollister.

The essential of such a deed is that it be delivered and the title thereto conveyed; that the grantor has no power to change or withdraw it. No change could, therefore, be made in this deed. If a conveyance of the personal property was made, by the very fact of the continued use of the money in the bank it would possibly tend to invalidate the whole transaction, as, if title is not passed, then the conveyances are valueless. As the property is homesteaded it would seem that there is no cause for this transaction in any event, as upon the death of either husband or wife the survivor becomes entitled to the property and a very simple probate procedure is needed to establish the fact of death of record. Upon the death of both of the spouses the homestead would then operate to convey the property to the children jointly without the necessity of any such dangerous proceedings as are outlined above.

FARMERS!

This Is *Your* Banking System

CONGRESS has given you a farmers' co-operative mortgage loan system. And the United States Supreme Court has declared it constitutional.

It is now up to farmers to make the Federal Farm Loan System meet the needs of farmers. Thousands of farm owners have surplus capital for *safe* investment; other thousands need more capital.

The Federal Land Banks distribute the surplus of the men who have more capital than they need to the men who need more capital than they have. And they do this in a manner safe and profitable for both.

Buy Federal Farm Loan Bonds

Denominations: $100, $500, $1000 and $5000

Both Principal and Income Are Tax-free

Federal Farm Loan Bonds are *safe*. They are secured by first mortgages on productive farms, the kind of assets with which you are already familiar, and in addition they are guaranteed jointly by the 12 Federal Land Banks with a combined capital of over $24,000,000.

Federal Farm Loan Bonds are *tax-free*. The principal is exempt; likewise the income from it.

Federal Farm Loan Bonds *yield 5%*—a better *net* income than that received from most farms rented to tenants.

Federal Farm Loan Bonds are *staple*. They bring a steady, dependable income twice a year, good seasons and bad. They are quickly convertible into cash. Farmers, merchants, millers, livestock buyers and others will find them A-1 security for bank loans.

Farmers who buy Federal Farm Loan Bonds help to build a farmers' national co-operative banking system—profits earned are paid to the farmer-borrowers who will eventually own all the stock of the Federal Land Banks.

Farmers' money invested in Federal Farm Loan Bonds keeps the profits made from farming in farm operations—helps to build up the whole farming business and helps every man in the business.

The farm tenant who invests his surplus every year in Federal Farm Loan Bonds is accumulating capital with which to own his own farm.

Farm boys and girls who buy small Federal Farm Loan Bonds are on their way to farm ownership.

The farm hand who purchases Federal Farm Loan Bonds is forming habits of thrift and investment which lead toward ownership of land.

Buy Federal Farm Loan Bonds from Any Federal Land Bank

Rubber Boots

For Ranchers and Irrigation Work

$3.98

A wonderful value in Hip or Knee Length Rubber Boots made of REAL gum Rubber with heavily reinforced seams. Made to order of the English Government for the British Army at actual COST OF MORE THAN WE ARE SELLING THEM FOB. Will stand all extremes of heat and cold and made to give extra long wear Finest quality pure gum rubber with extra heavy soles. This is one of the very finest BARGAINS we have ever been able to offer our customers and the stock is limited so get your order in very early. Nothing better can be worn by ranchers or men who work in irrigated districts, rice fields, etc. This quality of Hip rubber boot would usually cost you $7.50 to $8.00. Remember you can get the full HIP boots for $3.98 or the shorter knee length boots for $3.29. Be sure to mark which kind you want on the coupon below. WE DO NOT WANT YOUR MONEY IN ADVANCE. We take all risk because these boots are such wonderful values. Fill out coupon NOW and mail at once if you want some of these boots before they are sold out.

Send for free catalogue of shoes for men, women, boys, girls and children.

Plant Winter Rhubarb
FOR PROFIT

Powers netted this year $1000 per acre. April, May and June are absolutely the best months to plant for full crop next winter and spring. We can supply plants of all sorts for large fields. Write for price list.

J. B. WAGNER
Rhubarb and Berry Specialist, Pasadena, Cal.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

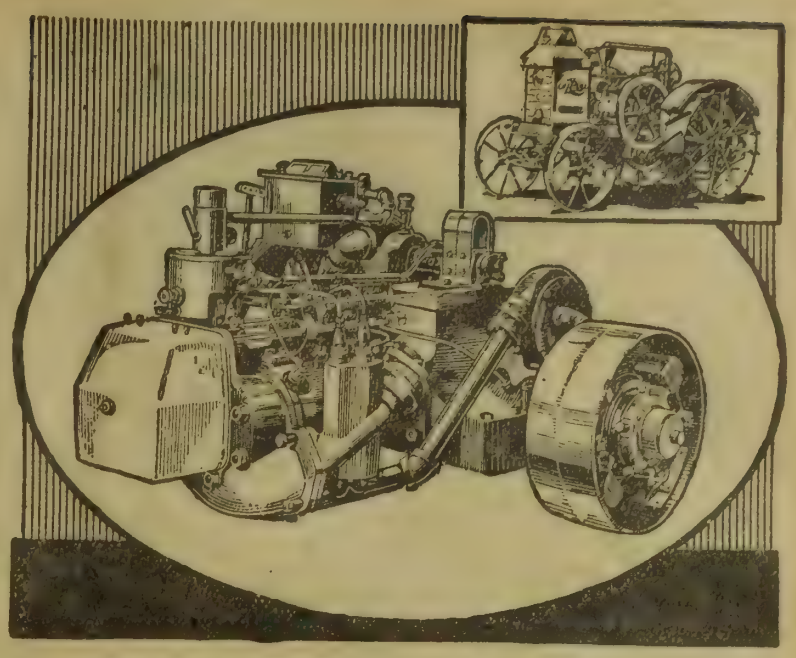
Aphis

Answering several queries as to control of aphis: Tobacco dust, nicotine sulphate or a decoction made from slowly steeped tobacco stems for several hours is about the cheapest, most effective remedy. Kerosene emulsion is of course good but rather more expensive.

First Threshing Machine

When was the first threshing machine invented and where manufactured?—Subscriber, Oxnard.

When they tired of shelling the "corn" from the head of wheat by hand the Egyptians many centuries ago began threshing on a circular floor, using sheep, oxen, goats, or other animals to tread out the grain. After the animals had finished their work the winnowing was done by tossing the material in the air on a windy afternoon and the straw and chaff were blown free from the grain. Next came the flail with its five foot stick with an added 30 inch piece attached by rawhide thongs. This flail was in use until late in the '60's, and the writer of this recalls many a thump on the head because of childish effort to swing this formidable weapon. We understand the flail is still used in Japan and some other countries. But going back a ways in history it seems the first machine operated by power was invented by a Scotchman named Michael Menzies in 1782. This was a system of flails operated by water power, in no sense like our modern threshing machines. In 1758 another Scotch farmer invented a rotary proposition still continuing the long arms from a large drum. The first really successful cylinder type of machine was invented in 1786 and improved somewhat in 1800. This was a drum or cylinder in which pegs were placed, this somewhat along the line of the common threshing machine cylinder. Early in 1800 a crude system of winnowing was added to this machine. American farmers were also making crude implements in the early 1800's. One of these machines was known as the "groundhog," operated by tread power. It consisted of a spiked cylinder revolving over a spiked concave. There was no cleaning mechanism. The straw was forked away from the tail of the machine and the pile of chaff and grain was cleaned by running through a hand fanning mill. All machines made in the early 1800's were stationary, usually being built in as a part of the barn. The first portable threshing machine was invented by Hiram and John A. Pitts at Winthrop, Maine. George Westinghouse, father of the inventer of the air brake, made threshing machines as early as 1840. Later he made a number of practical improvements in separating and cleaning devices. After 1850 wheat growing became a more important industry, and endless aprons or belt type of carriers came into use. The real vibrator type of separator was not made and brought into general use until after the Civil War. Cyrus Roberts of Belleville, Illinois, patented a series of vibrating racks and other features which have made the modern threshing machine possible.



The OilPull Motor Is a Marvel of Perfection

In talking of OilPull performance with an owner he will invariably come back again and again to the OilPull motor—the finest tractor motor in the world.

It is the type of tractor motor that has proved the most efficient and durable in public and private tests for the last twelve years—two cylinders, low speed, heavy duty, valve-in-head.

It stands absolutely alone for fuel economy—especially built for fuel oils and guaranteed in writing to operate successfully on kerosene under all conditions.

It is the only oil cooled tractor motor—unaffected by extremes of heat and cold.

Its crankshaft is built to U. S. Naval specifications—80,000 lbs. tensile strength as against the usual 50,000 lbs.

It is throttle governed—the engine speed is automatically and instantaneously adjusted to meet changes in load.

And throughout, the OilPull tractor possesses the same perfection of design as is found in the motor.

The OilPull is made in four sizes, standard in design.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

A year's supply of oil is sent with every Aermotor

Rhubarb From Seed

Will rhubarb seedlings come true to the variety of the seed?—Subscriber, Paradise.

No, not as a rule. The Crimson Winter has been largely reproduced by the use of seed but severe culling has been necessary in order to reduce the number of non-profit making plants. The larger, old time rhubarb plantations were secured through division of plants.

Farm Loans to Soldiers

Can you give me any information in regard to the law passed for the soldier farm loan and how a loan is secured?—Subscriber, Tecnor.

There is no provision as yet made for loan to soldiers but there is provision for soldiers who have had experience and who have some means to secure an allotment in the state land settlement at Delhi, Merced County. For information regarding that write Dr. Elwood Mead, University of California, Berkeley. There is always opportunity to secure money from the federal farm loan bank at Berkeley.

Weed Pests

A and B have ranches joining and A has Johnson grass growing on his property. The seeds are blown over onto B's property. Is there any way of preventing him from allowing this grass to go to seed?—Subscriber, Los Angeles.

Yes, report to your horticultural commissioner, H. J. Ryan, Hall of Records, Los Angeles. His office has the power to compel property owners to eradicate Johnson grass and other weed pests.

Citrus Gum Disease

Is there any cure for gum disease on citrus trees?—Subscriber, Anaheim.

Scrape or cut away all diseased bark or wood tissue until clean white wood is reached. Paint over with Bordeaux paste made as follows: 1 pound bluestone, 2 pounds fresh burned lime. Dissolve the bluestone in one gallon water, using wooden or earthen vessel, by hanging it in a sack near the top of the water; slake the lime in about one-half gallon of water. Stir together when cool, making a mixture about the consistency of whitewash. Apply with a brush. May be applied to healthy bark as a preventive. Mix fresh each day or two.

Garget

Our cow gives curdy milk from one teat. That part of the bag seems feverish and swollen. This has occurred several times, then she gets all right. What causes it and what shall I do for her? Would the milk in the other teats be unfit for use? It appears to be all right.—Subscriber, Rialto.

It is possible this is inflammation of the udder or even contagious mammitis. In such case a veterinarian should be called. However, we presume it is simply congestion of the udder, or ordinary garget. Regarding this trouble "Diseases of Cattle" suggests: "In heavy milkers, before and just after calving, it is the rule that the mammary gland is enlarged, hot, tense and tender and that a slight exudation or pasty swelling extends forward from the gland on the lower surface of the abdomen. This physiological congestion is looked upon as a matter of course and disappears in two or three days when the secretion of milk has been fully established. This breaking up of the bag may be greatly hastened by the sucking of a hungry calf and the kneading it gives the udder with its nose, by stripping the glands clean thrice daily, and by active rubbing at each milking with the palm of the hand, with or without lard or, better, with camphorated ointment."

Pruning Almonds

What is the best method of pruning almonds? Where I cut off the ends of the limbs nearly always three or four limbs grow and it makes nearly an endless job of pruning.—Subscriber, Terra Bella.

There is nothing to do with these almonds so far as pruning is concerned until the next dormant season. According to present methods topping back should not be followed. We take it that is what has been done with this orchard. It is probable that when the trees are entirely dormant some of these numerous branches coming out at the tips may be removed, thus thinning the tree and allowing the light to reach the center of it.

Tomato Blight

Will you tell me how to prevent blight or wilt in tomato plants?—Subscriber, San Joaquin.

If this is the true summer blight, which it probably is if showing at this period of the year, the only prevention is to carefully loosen every plant which is showing the blight and destroy by burning. This may prevent its spread to other plants. No spray will reach this disease for as soon as the leaves begin to show the wilt the roots have become so infected that it is impossible to control. For the fall blight or that which comes as a result of warm, moist weather later spraying with a weak Bordeaux is best control.

Cucumber Beetle

Can you tell me what to do for my string beans which are infested with small green bugs with 12 or 14 black spots? Some call them lady birds but they are not. They eat the vines and breed fast in extremely hot weather. I have seen them clean a whole patch in a couple of days.—Subscriber, Newman.

These pests are the 12 spotted cucumber beetles, or diabrotica, but are in no way connected with the lady bird family. Lady birds are almost invariably friends of the grower and are increased and distributed by the state department of agriculture because of their aid in controlling aphis and other insect pests. The cucumber beetle, however, is an unmitigated pest and should be controlled immediately he makes his appearance. Use neutral arsenate of lead, eight pounds per 100 gallons of water, as a spray.

Preventing Flies from Breeding

Please advise me what to use in pig pens, outside toilets, etc., to keep down flies.—Subscriber, Pixley.

The best treatment of all is to make frequent distribution of the manure from pig pens in orchard or in the fields, where the sun soon removes possibility of increase of this pest. The privy vault, however, is another and far more dangerous proposition. The distribution cannot be made daily, hence greatest care must be taken in perfectly screening about, so adult flies cannot possibly secure entrance to the vault for depositing eggs. Note we say "must," for the greatest menace to health, in fact one of the most serious causes of death in this entire United States is the house fly which has been bred in privy vaults. In addition to the screening and preventing of the flies having access to the vault, use freely of chloride of lime, at least one pound to every eight quarts of manure. Freshly burned lime or even air slaked lime in large quantities is also beneficial. Either of these, especially the chloride, destroys or greatly lessens the fertilizing value of the manure. Very liberal use of kerosene sprinkled over manure is also effective though expensive. Iron sulphate, two pounds to the gallon of water, is effective, but the best treatment of all is thorough cleanliness, and if it is impossible to distribute in orchard daily then absolutely fly tight screen for vault or container for the corral cleanings should be provided. After thoroughgoing cleaning and disinfecting some flies will persist, and for them fly traps (there are many different types and all more or less effective), insect powder and poisons should be freely provided. One of the best solutions for killing is a diluted mixture of formaldehyde. Use a couple of tablespoons of the common formaldehyde in every pint of equal parts of milk and water.

Set this about the house. A piece of bread dropped in the middle of the saucer on which the flies may rest while drinking makes for more effective poisoning. Be careful that this is kept where children may not drink it. Also use the same, or even greater, care as to the ordinary poison fly paper. There are other fly poisons and sticky papers offered on the market which are effective.

Artichokes

Please advise in regard to artichokes. Just what is the best time to plant, also what variety and how to plant. We would appreciate this information if you can give it to us.—Mrs. A. E. J.

It really matters little what month you plant artichokes as they are evergreen and dealers keep them in pots. If to be planted in numbers it is better to get suckers or offshoots and set out during winter or early spring. No directions as to how to plant are necessary except as to distance. Rows in fields are six or seven feet apart and four or five feet apart in the row. You may plant seeds at any time of year and plant seedlings in field when six or eight inches high. Artichokes require good water supply and one must guard against aphis, which always infest plants in early spring and have also many protecting ants. Spraying with a 40 per cent solution of nicotine will get rid of these, though the writer banished them quickly last spring with tobacco dust sprinkled liberally over the plants.

Sweet Potatoes

Will you inform me through your columns as to the care of runners on sweet potato vines after they have attained a length of three feet or more? Is it advisable to cut the runners off so they will not cross the furrows? I have noticed that these runners take root and bunches of very small potatoes form, especially on the sides of the ridges and in the furrows. This is more noticeable in medium heavy soil. About what size should the potatoes be when one stops irrigating?—Subscriber, Van Nuys.

It is not advisable to cut away any foliage, for it alone manufactures food for the growing crop. Throw the long vines up on top of the rows. Irrigate until time of harvesting.

Cucumbers

Please advise in regard to planting cucumbers, just what variety, also what is the best time of year to plant. We are located on the coast in Monterey County and in frostless belt.—Subscriber, Watsonville.

For early cucumbers seeds are generally planted in hotbeds in February. For field culture any time from March to October will do. Plant four to six feet apart and a half dozen seeds to a hill. Four of the strongest plants are enough to a hill. As cucumbers are ready to pick in about six weeks from planting seed some do not irrigate. Soil dictates this, but damp soil is needed and time of year dictates water supply. The good varieties are many. Arlington, White Spine and Klondyke are recent favorites and for pickling nothing surpasses in crop or value Chicago Pickling.

Fruitless Currants

Once more I turn to you for information and assistance. We always read and rely on your columns. About eight years ago we set out some currant bushes from Massachusetts. They have never borne much, though looking fairly well. Do they need some other kind to pollenize them or is the ground not adapted to currants? If so, what kind is best?—Subscriber, Buena Park.

There are a few sections of Southern California where currants bear well and in the northern third of the state, especially in coastal districts, they thrive. The same is almost as true of gooseberries. In damp climates, as England or Oregon, these bush fruits attain perfection, bearing larger crops and fruits than the Eastern states. Cool weather and especially cool, damp, humous soil are necessary to success. Heavy summer mulches of straw or leaves or top soil of leaf mold, or one heavy in decaying vegetable matter would contribute to success, but a sandy soid without such amendent will not produce currants. We doubt if cross pollination would prove an aid.

Alkali in Water for Animals

Is alkali water injurious to animals that drink it?—Subscriber, Lancaster.

That would depend entirely upon the percentage of alkalinity. Certainly high percentage of alkali would be injurious if the animals would drink it at all. If there is any question the water should be analyzed.

Sick Tomatoes

I have about 5,000 tomato plants which seem to have some kind of sickness. They turn yellow and then die. Will you let me know what the trouble is and what should be done to remedy it?—Subscriber, Winton.

This is possibly blight although that is usually manifested by wilting and curling of leaf rather than by yellowing. There is a yellowing of spots, a disease called leaf spot, in which the oval or circular spot, usually very small, is yellowish with a darker margin. This may be corrected by a spray of Bordeaux, 3-4-50.

How to Secure Farm Loan

Can you give us any information in regard to a government loan to apply on a ranch of 90 acres? It is in need of repairs on dwelling house and buildings. There is a mortgage of $2,500 against the ranch now. The ranch is valued at $25,000.—Subscriber, Escondido.

Write Federal Farm Loan, Bradbury Building, Los Angeles. The loan may be secured up to half its appraised value, the appraisement to be made by committee appointed by local association and to be verified by a representative of the bank at Berkeley. The loan may be made for the purpose of paying off a prior loan or for improvements on the ranch. It is made only to owner who lives on it and farms the place.

Poisoning Squirrels on Highway

Is there a law in California requiring the poisoning of squirrels along the state highways, county roads and railroads as well as on the farms? If so, whose duty is it to see that such things are done? Is it not against the law to let Russian thistles grow on public or private property in the state of California?—Subscriber, Saugus.

Yes, the county or state is expected by law to keep its property free of these pests and the horticultural commissioner of your county will doubtless aid in encouraging railway people or others in ridding their lands of these pests. Even the federal government joins in these campaigns where it has holdings near improved property. The above also applies to weed pests.

Jerusalem Artichokes

Am writing again to the "old reliable" for information. I wish to know two things, viz: What about the practice of cutting back the tops of Jerusalem artichoke? What effect will it have on the plant and the yield?—Subscriber, Paradise.

Every plant is dependent for food upon plenty of green leaves. Every one of these cut off deprives the food factory of a workman. Occasionally a plant may have too many leaves, but such cases are rare. Therefore leave the leaves. To cut off flowers alone would doubtless benefit the crop, diverting the plant food from the development of seeds to the development of tubers, thereby increasing the yield of the latter.

Rot of Lettuce Leaves

Will you please tell me what causes some of the leaves to rot in head lettuce? How may this be prevented? How long after lettuce begins to head before the seed stalk starts growing? Is lettuce an astringent?—Subscriber, Tracy.

The most common cause of rotting of lettuce leaves is dampness. Commercial growers use every possible

(Continued on Page 791.)

Paints

Standard Paints Are Lower Now

We cannot reasonably expect these prices to remain in force much longer. The cost of everything that enters into paint manufacture is showing an upward trend, and as soon as present stocks are exhausted these prices will probably advance.

Remember, too, these prices are quoted on pure oil paints, not these so-called "mineral" paints.

Standard House Paint, Gallon, $2.25

This price on all our standard paints for outside uses—a wide variety of colors to select from, floor paint for interior use. Hard finish, quick-gallon.

Floor Paint, Gallon, $2.25

This price on a full range of colors of standard floor paint for interior houses. Hard finish, quick-drying paint.

Porch Paint, Gallon $2.90

A special paint for porches and exposed floors. Has an unusually hard finish enabling it to withstand weather conditions. Choose from a variety of colors.

Graphite Paint, Gallon 80c

Graphite roof paint, an excellent paint for old and leaky roofs. This price is only 5c a gallon higher than the price in 1916. 80c a gallon in 5 gallon cans only. Single gallons, add 10c a gallon.

Shingle Stain, Gallon 75c

Our own Red and Brown shingle stain, made from standard ingredients. This price for 5 gallon cans. For single gallons, add 10c. Green stain, gallon 85c in five gallon cans.

Roof Paint, Gallon $1.20

Red or slate roof paint for new or old roofs. Heavy body and covers well. Price, in five gallon cans, $1.20. For single gallon, at 10 cents.

Electric Irons, with Switch in Cord, $4.65

A special price on high grade electric irons fully guaranteed. Has split plug to screw into socket, making it easy to disconnect, and a handy switch in the cord so you can turn off the current without disconnecting the iron. Weighs 6 pounds.

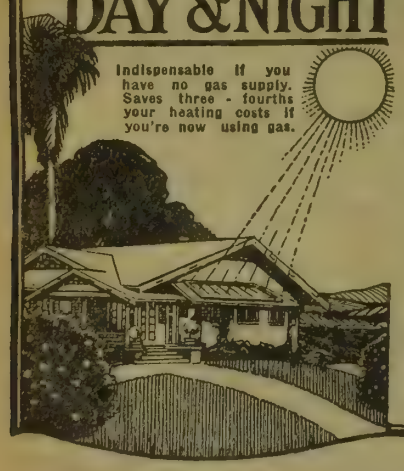
Let the SUN give you plenty of HOT WATER

DAY & NIGHT



SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept. E.

THE FLAG GOES BY

(Flag Day, June 14)

Hats off!
Along the street there comes
A blare of bugles, a ruffle of drums,
A flash of color beneath the sky.
Hats off!
The flag is passing by!

Blue and crimson and white it shines
Over the steel-tipped, ordered lines.
Hats off!
The colors before us fly;
But more than the flag is passing by:

Sea fights and land fights, grim and great,
Fought to make and save the state:
Weary marches and sinking ships;
Cheers of victory on dying lips;

Days of plenty and years of peace;
March of a strong land's swift increase;
Equal justice, right and law,
Stately honor and reverend awe;

Sign of a nation great and strong
To ward her people from foreign wrong;
Pride and glory and honor,—all
Live in the colors to stand or fall.

Hats off!
Along the street there comes
A blare of bugles, a ruffle of drums;
And loyal hearts are beating high;
Hats off!
The flag is passing by!

—Henry Holcomb Bennett.

HOUSEHOLD QUERIES

Using Honey

Will someone kindly send in recipes for cakes, cookies or pies using honey instead of sugar. Some of us are not allowed by our physicians to use sugar and the recipes would be very acceptable.—Mrs. L. G. Rapp, Glendale.

Pumpernickel

I wonder if one of our good housekeepers, subscribers of Cultivator, would favor me with a recipe for the old time real pumpernickel. One cannot buy it here. It is made into brick shape loaves and looks almost black. They sometimes name it black bread and it is very good. We find so many inexpensive good recipes in your corner that I am truly fortunate to call myself a subscriber.—Mrs. M. M., Los Angeles.

Lemon Juice

Will you please reprint directions for putting up lemon juice so it will keep. It was in the Cultivator some time ago but I sent my paper east so lost the recipe.—Subscriber, Los Angeles.

This was first given in the Cultivator of March 26 and reprinted in the issue of May 21 on request of a Reedley subscriber. We hope that our inquirer noticed this reprint. If not and she will send name and address we will mail copy to her.

Canning Beans and Peas

Would someone kindly give me two good recipes for canning green peas and also for canning string beans? I like your household department very much and your recipes are all very good.—Subscriber, Willows.

As canning season is upon us we reprint directions given in a University of California leaflet, which gives comprehensive instructions for handling all vegetables.

1. Preparation of vegetables: Shell peas, string and break green beans, husk corn, remove tops of beets, turnips and carrots, cut asparagus into lengths to fit the jar and in general remove waste parts and prepare as for cooking.

2. Scalding (blanching): Place the prepared vegetables in a cheesecloth bag or wire basket and immerse in boiling water—corn on the cob, peas, beans and asparagus, five minutes; tomatoes, one-third minute; beets, 15 minutes. Other vegetables, three to five minutes.

3. Chilling: While still hot and as quickly as possible plunge into clean cold water for a few seconds and allow to drain for a minute. The colder the water the better.

4. Packing: Pack the dipped vegetables immediately while still hot in cans or jars. Jars should be heated before filling. Beets and tomatoes are peeled and corn cut from the cob before packing.

5. Preparation of brine: Dissolve three ounces (three level tablespoons) of salt in one gallon of water and add five ounces (a small jelly glass) of lemon juice; corn requires eight ounces. Tomatoes are acid and require none. Strong vinegar may be used instead of lemon juice.

A glass measuring cup should be used to measure the lemon juice. If only one quart of brine is to be made up add two level teaspoons of salt and two and one-half tablespoons of lemon juice to a quart of water. Use twice this amount of lemon juice for corn. The lemon juice may also be used by filling the jar of packed vegetables with hot water and adding two teaspoons of lemon juice to a pint jar and four to a quart, with salt to flavor. Sterilize as above.

6. Heating and filling with brine: Heat the brine to boiling and pour over the vegetables in the jars. If the jars are hot and a funnel used there is little danger of breakage. Apply rubbers and loose covers as with fruit and place in sterilizer. Pack tomatoes without brine.

7. Sterilize in a wash boiler: Sterilize as described for fruit, but leave corn two hours, beans one and one-half hours and other vegetables one hour after steam issues from the boiler. Remove, tighten covers and allow to cool in an inverted position as with fruit.

How to Candy Cherries

I should like very much to know how to candy fruits, especially cherries.—Subscriber, Orland.

Puncturing, peeling and cutting: Small crab apples, apricots, plums, cherries and ripe but firm figs are used whole after puncturing in numerous places with a wooden toothpick. Peaches and pears are peeled and cut in half. The peels of citrus fruits are used without the pulp. Peeled and cut fruits do not require puncturing.

Cooking until tender: After preparing as above, the fruit is cooked gently. This requires from three to five minutes for most fruits. Hard fruits require longer. Citrus peels may require 30 minutes or longer. Too much cooking will spoil the shape and texture. Too little will result in slow penetration of the sugar, dark color and toughness.

Placing in syrup: Make a syrup of 25 degrees Balling, about one part sugar to three of water. A little more sugar for very sweet fruits. Heat the syrup to boiling and pour over the cooked fruit placed in an earthenware pot while still hot.

A Balling saccharometer is convenient when working on a large scale, but is not necessary for small quantities. Half the sugar in the first syrup may be replaced with Karo or other liquid glucose. This prevents the hardening of the finished fruit by crystallization and makes it more translucent.

Increase of sugar: Keep submerged in syrup. Remove the syrup every 24 hours, increase five degrees Balling by the addition of about one-quarter the amount of sugar used originally, boil, and pour back on the fruit. When the syrup reads 68 degrees Balling (as thick as honey) it is dense enough.

Drying: Leave in the last thick syrup until it has penetrated the fruit (three to four days) and then place on a wire screen to drain a few days until the outside of the fruit ceases to be sticky. The fruit will drain more quickly if placed in the sun or other warm place.

Packing: The finished fruit may be packed in candy or cardboard boxes lined with paraffin paper or in open jars. In air-tight containers they may mold; some ventilation is necessary.

Drying Prunes and Figs

Would someone give a good recipe for drying prunes and figs. — Subscriber, Orange.

Prunes and figs are dried whole. Both are allowed to ripen on tree and drop naturally to ground before drying. In this way they reach the maximum sugar content and the flesh is more tender.

The Cultivator Patterns

3612-3220. Ladies' Costume—Waist 3612 cut in seven sizes: 34, 46, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3220 cut in six sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. Its width at the foot is 1¾ yards. To make this model for a medium size will require 6 yards of 38 inch material. TWO separate patterns 10 cents FOR EACH pattern.

3620. Girl's Dress.—Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size will require 3⅝ yards of 27 inch material. Price 10 cents.

3313. A Simple House Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 6½ yards of 27 inch material. The width of the skirt at lower edge, with plaits extended is 2¼ yards. Price 10 cents.

3604. Boy's Play Suit.—Cut in four sizes: 2, 3, 4 and 5 years. A 3 year size will require 2⅝ yards of 36 inch material. Price 10 cents.

3591. Ladies' Dress.—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 3⅝ yards of 54 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

3314. Junior's Dress.—Cut in three sizes: 12, 14 and 16 years. A 14 year size requires 4¼ yards of 40 inch material. Price 10 cents.

3605. Ladies' Apron.—Cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 3½ yards of 36 inch material. Price 10 cents.

3300. Girls' Dress.—Cut in four sizes: 8, 10, 12 and 14 years. A 10 year size will require 3⅛ yards of 27 inch material for the blouse and 2⅛ yards for the skirt. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

Prunes are placed in a wire basket and dipped for a few seconds in a solution of lye (one pound to 30 gallons of water), held at the boiling point. Shake basket sharply so fruits will shift position and be wet on all sides. Dipping the prunes causes a slight checking or cracking of the skin near the stem end, which facilitates drying. If the lye is too strong or immersion too long, the skin may peel off. After dipping, the prunes are spread in a single layer upon trays and dried in the sun. They may dry unevenly. In the cool of the day the properly dried fruits may be removed. Prunes are dry when they are leathery to the touch but not hard enough to rattle against the tray. When too dry they may be dipped momentarily into boiling water and piled in bins or on a clean floor while still damp. The moisture is soon equalized. It is well to turn them over with a shovel a few times.

Mission figs are dried on trays in the sun. No further treatment is generally necessary. The second crop of the Adriatic and Smyrna is the only one of sufficient size and importance to be of value for drying. The limp and partly dried figs drop naturally or are lightly shaken from the tree and are picked up within three or four days since an inferior product results from too long exposure to the effects of sun, dust and insects. The figs are spread on trays after which the Adriatics are sulphured to bleach the skin and improve the appearance. Sulphuring in lug boxes is often practiced but does not give as uniform or as good results as on trays. Smyrnas which are properly handled should not require sulphuring. Adriatics are dried in direct sunlight from one to three days depending upon the heat and humidity, while Smyrnas are best dried by stacking the trays one above the other so as to allow free circulation of the air between. Over-dried figs become tough, woody and inferior. After sorting out the bird pecked and split fruit, the figs are dumped from the trays into perforated boxes or containers, washed for 20 minutes in cold water containing four ounces of salt to the gallon of water, and again spread out for a final drying of half a day in the sun. They are then placed in piles on a clean floor or in sweat boxes, where they are allowed to go through a sweat for about two weeks, being turned with a shovel two or three times during that interval. Sweating equalizes the moisture and gives the product a better texture. The figs can then be stored for packing, to prevent infestation by insects.

HINTS FROM HOUSEKEEPERS

Bluestone for Ants

I see in Cultivator of May 14 "The Exasperating Ant Nuisance." If anyone bothered with ants can find the hole where they live and in the evening after they have gone in for the night, put a teaspoon or tablespoon of bluestone on the hole and pour a gallon of water (pour slowly) through the bluestone and down the hole he will never see the ants again. With best wishes to Cultivator and all concerned.—J. B. Cloud, Cedarville.

Sending Orange Blossoms East

Noticed in your paper of May 14 that a subscriber from Colton wants to know how to send orange blossoms East. I once sent some from Florida to Colorado. Take a good sized potato and insert the stem of the branch in it. A good way to do this is to make the hole in the potato smaller than the stem to prevent the bark from peeling off, but not too big so the branch will come out again. It would be best to nail or fasten the potato to the end board of the box, as the potato is heavy and will roll about and break the blossoms unless fastened. Then a ribbon or cord should be tied over the middle of the branches from side to side to hold in position on bottom. Would like to hear from the subscriber how it worked if she uses my idea.—Reinhold Kruger, San Diego.

* * *

Another: I think I can solve the problem for the Colton subscriber. If she will punch small holes in a raw potato, then take a narrow bladed knife and scrape the holes larger,

Raisins—a "Beauty Food"

It is iron in the blood—a tiny supply of it daily—that helps to bring the bloom of youth to women's and children's cheeks.

Raisins, rich in immediately assimilable iron, therefore may be called a "beauty food." Eat raisins daily and be sure that you get all the iron you need.

The Luscious "Energy Dessert"

Serve to tired men at dinner

Raisin Pie

1 cup SUN-MAID Seeded Raisins
1 cup water
1 level teaspoon salt
1 tablespoon corn starch
1 teaspoon sugar (may be omitted)

Wash the raisins, put in saucepan with cold water, bring slowly to a boil; add sugar, salt and corn starch, which has been mixed with a little cold water; boil three minutes; pour in pie tin which has been lined with crust, while hot; cover; brush top with cold milk.

Pie Crust

1½ cups flour
½ teaspoon salt
2 tablespoons shortening.

Sift flour and salt together; add shortening, rub in very lightly with tips of fingers; add a little very cold water, just enough to hold together. The less you handle the dough the better the crust will be, and if made as the recipe tells, it will be a very dry crust.

Try a raisin pie tonight—made according to the recipe at the left.

See how delighted your men folks will be. And note how it "sets them up" in spirit and in strength after a hard day's work.

They'll be surprised to feel the energy and new vigor which are almost immediately imparted through the raisins.

Raisins are nature's own confection in a pie — sweet, tender and delicious. The juice forms a luscious pie sauce. It's an epicurean dessert.

Try it now. Learn what *real* raisin pie is like. Every first-class baker has this pie.

SUN-MAID RAISINS

Sun-Maids are the *clean, sweet, wholesome* raisins, packed in California, in a great immaculate, glass-walled plant. They're your own American raisins, and you know they're *good.*

Luscious, tender, juicy, meaty raisins, made from finest table grapes. Always ask for them *and get them.* Use in cakes, pies, cookies, puddings, salads, etc.

Three varieties: Sun-Maid Seeded (seeds removed); Sun-Maid Seedless (grown without seeds); Sun-Maid Clusters (on the stem). Insist upon the Sun-Maid brand. Send coupon for free book, "Sun-Maid Recipes." Learn how to use in many attractive ways.

place the stem of an orange bud in the hole and pack the scrapings around the stem, by the time it reaches the East the buds will be in full bloom. The potato must be fastened to bottom of box to prevent crushing in handling.—J. E. Meier, Jamestown.

* * *

For "Subscriber," Colton: I have sent flowers long journeys and this is how I prepare them. I cut them late at night or very early in the morning before the sun has touched them, cutting only those just beginning to open. I put the stems in fresh cool water and keep them in a cool dark room (cellar) 24 hours or a little longer. This seems to make them firm and add greatly to their freshness and keeping qualities. I then place water-soaked absorbent paper around the stems, taking care not to wet the blossoms or they might mildew or drop from the stems. I use waxed or oiled paper for an outer covering and to protect the pasteboard box, and sometimes when I send the more fragile flowers I pack each blossom separately so that they do not touch each other. I have sometimes wrapped orange blossoms in paraffine paper and have been told they were received in good condition and without loosing any fragrance. This, however, was only used for a long journey. Often wilting flowers can be made fresh again if the stems are cut back a little and then inserted in a vase with hot water and put in a cool dark place for a few hours.—Mrs. A. Stainton, San Fransisco.

* * *

Paraffining Blossoms.—I think it is possible to send so much embalmed perfume to Massachusetts they will need to open doors and windows. I have sent blossoms to six different places this winter, and those to Illinois were picked April 1, in the morning, waxed, sent and received on April 6. Pick flowers without dew or rain. Pick sprays with only one or two open flowers and some nearly bursted buds, but none with formed fruit as they discolor more easily. Have plenty of melted wax, but cooled to prevent cooking the flowers, and dip each twig in and out to insure a good paraffine bath. Just dip them head first as they are not burnt by the wax as you might imagine. Lay on a board or newspaper to harden. Line a box with tissue paper or waxed paper, fern if you have it, and lay in the waxed blossoms. Put more fern on top and double over the remaining tissue paper for padding and put on cover. It may sound queer to say put on cover, but I discovered that the nearly bursted blossoms opened one night after I waxed some blossoms in the afternoon. I left the opened box on the table and the perfume was quite strong. I sent some blossoms to a wedding and the fragrance from the few on the bride's veil was quite sweet. Rose buds of rose, golden, or red are lovely when waxed as above. They retain their color and shape. Also geranium and honeysuckle do well. This has been my experience but I have been told that flowers picked and stood over night in water and the ends dipped in wax the next morning are very nice. The lady then wrapped each flower branch in waxed paper. The editor's suggestions are good. If you are afraid the perfume won't be as strong as you might wish put in a sachet of orange blossom and if you fear a delay at the last minute (as I did for the wedding I attended) put on a special delivery. My friend received her blossoms before breakfast on her wedding day because of added postage. I surely hope for the success of your "waxing bee" and that the flowers arrive in time with plenty of fragrance. —Mrs. E. F. Kraschel, Orange.

Muffins—Fig Cookies

In response to a request for recipes for muffins and fig cookies in recent Cultivator will send the following hoping it may be liked.

Muffins.—Beat 1 egg well in mixing bowl with 1 teaspoon salt and 2 tablespoons of sugar. Add 1¾ cups sour milk or buttermilk, 1¾ cups of whole wheat flour. Stir until smooth, then add 1 teaspoon (level) soda dissolved in a little water and 2 tablespoons melted shortening, if sour milk is used. Buttermilk requires no shortening. These may be made with graham flour and ½ cup of white flour if one prefers. Be sure not to have batter too stiff.

Fig Cookies.—One cup butter or ¾ cup of Crisco, 2 level cups sugar, 2 eggs separated, 1 cup sweet milk, 1 teaspoon orange extract, 3 level teaspoons baking powder, 5½ cups flour, sifted before measuring, 1 teaspon salt. Beat butter and sugar to a cream, add yolks of eggs, beat well, add milk, extract, whites of eggs stiffly beaten, flour sifted with baking powder and salt. Knead lightly on a floured board and roll out very thin. Cut in shapes and spread half with the fig filling, place other half on top, pressing edges lightly together. Place on an inverted cookie pan, bake for 15 or 20 minutes in a moderate oven.

Filling for Cookies.—One pound figs, 2 teaspoons grated orange rind, 1 orange, 1 cup honey. Squeeze the juice of orange in a cup, fill with water, then add 1 more cup of water. For Filling: Wash figs and cut into dice, put them in sauce pan, add orange rind and strained juice, honey and water; cover and simmer, stirring often, until reduced to jam.—Mrs. E. K. Peirce, Azusa.

Fig Cookies—Raisin Muffins

Here are two recipes asked for by an Oakdale subscriber.

Fig Cookies.—One cup sugar, ½ cup butter or substitute, 1 egg, ½ cup sweet milk, 3½ cups of flour sifted with 2 teaspoons baking powder, 1 teaspoon vanilla. Mix well and roll very thin. Cut and place on each cookie a teaspoon of the following mixture and put another cookie on top, pinching the edges together.

Filling.—One cup chopped dried figs, ½ cup sugar, 1 tablespoon flour, ½ cup water, lemon juice to taste. Cook until thick, cool and use as above. This is fine with raisins in place of figs also.

Raisin Cornmeal Muffins.—(This is adapted from the recipes sent out by the Sunmaid Raisin Association.) Three-fourths cup cornmeal, 1½ cups flour, ½ teaspoon salt, 1 cup seedless raisins, 2 tablespoons sugar, 1 cup sour milk, ½ teaspoon soda, 2 tablespoons shortening. Mix well and bake in hot oven about 20 minutes. These are delicious made with rich buttermilk and no other shortening.—Mrs. J. R. Beam, Ceres.

Gems—Oatmeal Muffins

Two cups rolled oats, 1½ cups sour milk, 1 egg, 1 cup flour, 1 tablespoon shortening, 1 teaspoon soda, ¼ cup sugar, pinch of salt. Mix oats in sour milk and let stand over night. In morning add beaten egg and other ingredients and stir well. Bake in gem pans in hot oven. If you use buttermilk omit the shortening.

Gems.—Two cups ground oatmeal, 1 cup corn meal, 1 egg, ¼ cup sugar, 1 tablespoon shortening, ½ cup white flour, 3 cups sour milk, 1½ teaspoons soda. Good as loaf also.—Mrs. Warren Roberts, San Diego.

Fig Newtons

I am sending you a good recipe for Fig Newtons. I hope they are what your Oakdale subscriber is looking for. As for the sour milk muffins, I hardly think your recipe can be improved upon. Of course if one doesn't wish to use the graham flour it is easy to substitute with white flour. We enjoy your paper so much.

Fig Newtons.—Cream ½ cup butter or Crisco and 1 cup sugar. Add 1 egg well beaten, ½ teaspoon salt, ½ cup milk, 1 teaspoon vanilla and 3 cups of flour sifted with 3 teaspoons baking powder. Roll out like pie crust. Cut in strips 3 inches wide and spread with the following paste: Chop 1 cup dried figs, put in sauce pan with 1 cup boiling water and ½ cup sugar mixed with 2 tablespoons of cornstarch. Boil 5 minutes or until thick. Cool and use. Place another strip of dough on top, cut in oblongs, bake in quick oven. —Mrs. J. C. Smith, Riverside.

Many a woman is blamed for making a fool of a man when he is really self-made.

RECIPE FOR RICE DAY

Wash California rice thoroughly in several waters until water is clear. Put in kettle, add cold water, using 1 part of rice to 1¾ parts of water, cover closely and bring quickly to the boiling point. Let boil about 10 minutes, then add ½ to 1 teaspoon salt and let steam over low heat for 15 minutes, or until ready to serve. Do not stir nor add more water nor uncover. Rice should not be put into boiling water. Adding salt to the water during the first of cooking process impairs the flavor of the rice.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

June 15, H. A. De Wolf, Ripon.
June 29, Gotshall & Magruder, Ripon.

Burr Farm, Los Angeles, reports first attempts at seven day tests: Cometta Pauline 2d, 5 years, 28.28 pounds butter, 603.3 pounds milk; Amelia Bona De Kol 2d, 6 years, 26.15, 574.7; Clothilde Walker Sadie Vale, 4 years, 25.50, 378.5; Carnation Rag Apple De Kol, 3½ years, 20.00, 487.2; It Changeling Wildwood, 3 years, 27.49, 449.1; Snowball De Kol Pontiac Lass, 2½ years, 20.59, 418.2; La Reina Sadie Vale, 2 years, 18.90, 393.5; S. V. K. P. Miami of Sunnyside, 3 years, 24.27, 499.3; all being continued on semi-official test. Also completed the following yearly records but have not yet received the association's final figures: Johanna Princess Aaggie Korndyke 2d, 6 years, 976 pounds butter, 23,143 pounds milk; Princess Una Hengerveld, 6 years, 748, 17,281; Korndyke Mechthilde Keyes, 8 years, 911, 23,853; K. P. Tola, 8 years, 1,014, 22,966; Stratford Segis Blanche De Kol, 6 years, 669, 18,694; Gracia Pontiac Burke, 3 years, 713, 19,678; S. V. K. P. Fidessa of Sunnyside, 2½ years, 719, 21,440; S. V. K. P. Aaggie of Sunnyside, 2½ years, 665, 16,845; Helm Gelsche Arona Mead, 3 years, 305 days, 596, 16,374; Lieuwkje Murphy Pietertje, 2½ years, 305 days, 545, 13,574. "We are running about 40 head on yearly test. Of the several that have been in milk six months or more, one will finish with 1,000 pounds, one with 900 pounds and four three and four year olds will have over 800 pounds. Have recently sold a good young bull to W. A. Rowland of Puente. We have just shipped two young bulls, a cow and a calf to Canada."

James Mills, Jr., writes: "A short time ago we had the pleasure of picking out a small Berkshire herd for G. F. Lee of Oroville. Since that time he has made three additions to the herd. When new breeders come into the market and buy Berkshires for a herd it looks well for the breed. Many throughout the country are doing the same as Mr. Lee has done and are laying the foundation for a tidy little income which comes in throughout the year. The herd which Mr. Lee now has consists of animals descended from the four following outstanding boars—Laurel Champion, Ames Rival 70th, Penrith Champion, Improper B."

Bullard Bros., Woodland, report sale of 150 yearling Rambouillet rams to Jameson and Murry of Montana. Bullard Bros. owned one of the most noted flocks in the West and have produced many of the top rams of recent years. They expect to send a carload of rams, together with a shipment of ewes, to the Del Rio, Texas, ram sale next month.

J. D. Rowe and Sons of Davis, lessees of the Innisfail Milking Shorthorn herd, have recently completed a number of very creditable records made under average farm conditions. Princess Clay, an eight year old cow, produced 464.136 pounds of fat from 12,459.4 pounds of milk; Sentinel Pine Selma, five years old, 409.66 pounds fat from 11,090.5 pounds milk; Greenhill Caroline, five years old, 379.84 pounds fat from 10,983 pounds milk; Innisfail Daisy, two years old, 402.3 pounds fat from 10,023.2 pounds milk; Princess Fillpail, two years old, 327.31 pounds fat from 9,166.4 pounds milk; Buttercup, seven years old, 327.39 pounds fat from 8,856.3 pounds milk; Island Buttercup, three years old, 284.56 pounds fat from 8,489.3 pounds milk; and Buttercups Beauty, two years, 278.69 pounds fat from 7,333.5 pounds milk.

W. M. Carruthers, Live Oak, has sold a Shorthorn bull sired by the former state fair champion, Count Glory, to Ben Gundry of Brownsville and one sired by Hallwood Viallager to D. Armstrong, Honcut.

E. Wyndham writes that his Ayrshire cow, Aaggie of Darroch, was first in her class among Canadian Ayrshires last year with 513 pounds of fat from 13,728 pounds of milk. A second cow in the herd, Tanglewyld Princess, holds two Canadian silver cups. Mr. Wyndham is building up a herd that he expects to take high rank among Western Ayrshires, and he is of the opinion that the Ayrshire is a most satisfactory cow for Northern California.

Winsor Ranch, Bonita, has recently secured a number of Jersey heifers and a bull from the famous Ed Cary herd of Oregon. The Cary herd is the home of the celebrated St. Mawes family of Jerseys.

The entire Shorthorn herd owned by the Jack London Ranch, Glen Ellen, is reported sold to Thomas Caulfield of Petaluma. The herd was established a number of years ago by the late author and following his death was conducted by his estate.

William Briggs and Son, Dixon, expect to be represented at the fall shows this year with show herd of Herefords. This is one of the newer herds to be established in California but owing to the high class purchases made during the past year the collection takes very high rank. Included in the herd now being fitted is the junior yearling bull that was first in a class of 22 junior calves at the 1920 American Royal, Beau Prince 33d, a son of Prince Donald. This youngster was an outstanding calf last year and unless something goes wrong will probably be "bad medicine" this fall. Herdsman William Cox will soon be established in a greatly enlarged barn fitted to the purpose of handling both cattle and sheep.

Glista Ernestine, a Holstein cow owned by Cornell University, has completed her seventh official seven day record of over 30 pounds of butter. Her last record is reported as 30.95 pounds of butter.

The Pacific International Livestock Exposition, Portland, Oregon, has sent broadcast an announcement and space chart for industrial exhibitors that is very valuable and interesting to all prospective exhibitors. It is information that can be filed away and can be used for reference in years to come. A large spread chart is inserted, giving arrangement of exhibit space in the implement and machinery exhibit building.

Aaggie Tula Acme Burke, a Holstein heifer owned by Morris and Sons, Woodland, the first daughter of Sir Aaggie De Kol Acme to complete a year's test, finished her year with the splendid record of 836.86 pounds of butter from 21,859.7 pounds of milk. She started her test at the age of two years and two months. Ten months after calving she produced 20.06 pounds of butter in seven days. If her performance is any criterion, and it unquestionably is, we can look for a long series of similar announcements. The first 12 daughters of Sir Aaggie De Kol Acme to finish 305 day records average over 600 pounds of butter and more than 16,000 pounds of milk as first calf two year olds.

J. I. Thompson, formerly with the animal husbandry division of the college of agriculture and now manager of the Straloch Farm, Davis, believes that hogs, with grain at present prices, offer one of the most attractive livestock propositions to be found. Thompson stated that because the Straloch Poland China herd was comparatively small at present, it was his intention to buy feeders through which to market their barley crop. Thompson declared that there is more money in raising hogs at present than any time during the last several years.

TILLY COMPLETES EIGHTH RECORD

Tilly Alcartra, owned by A. W. Morris & Sons, Inc., of Woodland, has just added to her great production record by completing her eighth year in milk. At the close of her eighth year Tilly has produced 201,135.4 pounds of milk and 7,815.12 pounds of butter, enough to fill seven refrigerator cars.

Tilly was not carried for a full year in the lactation period just ended, the production being for 305 days, in which she gave 20,675.2 pounds of milk and 738.61 pounds of butter.

RETAILERS TO BLAME

So far as the hog business is concerned we believe with President Harding that the trouble lies with the retailer. In Davis last week the wholesale butcher paid the producer 6½ cents for extra fine live hogs. We helped to load them and they were all tops.

The wholesaler sold the dressed pork—absolutely no waste—in Sacramento for 10 cents and the cheapest cut of pork offered in the shops was 30 cents a pound.

The retailers have a million reasons to offer as to the high prices they charge and none of them will hold water. It is about time something was done.

DISPERSAL SALE

50---REGISTERED HOLSTEINS---50

40 FEMALES—10 BULLS

H. A. De Wolf Herd, Ripon, Cal.

Wednesday, June 15, at 10 A.M.

In the dispersal of this herd there is offered a group of young cattle, popularly bred, and including a number of females with substantial official records and daughters of high record cows. The offering includes:

A 27 POUND COW with 589.92 lbs. butter in one year as a junior 2 year old, her dam a 28 lb cow.

TWO DAUGHTERS OF ABOVE 27 POUND COW, one by a son of Aralia De Kol, the other by a grandson of Tilly Alcartra.

A 24 POUND granddaughter of Colantha Johanna Lad that milked 601.9 lbs. in 7 days as a junior 4 year old. and her daughter by a son of Sir Skylark Ormsby Hengerveld.

A 23 POUND COW sired by a grandson of Pontiac Korndyke, and her daughter by a son of Sir Skylark Ormsby Hengerveld.

A 21 POUND junior 3 year old daughter of King Mead of Riverside, and her two daughters by a son of Sir Skylark Ormsby Hengerveld.

A DAUGHTER OF KING MEAD OF RIVERSIDE out of a granddaughter of Aralia De Kol, second dam a 27 lb. daughter of a 28 lb. cow.

A DAUGHTER OF SIR VEEMAN KORNDYKE PONTIAC out of a 22 lb. junior 4 year old.

A DAUGHTER OF SIR VEEMAN KORNDYKE PONTIAC out of a dam sired by a half brother to the 32 lb. cow Winifred Hotaling 3d.

A DAUGHTER OF SEGIS PONTIAC DE KOL BURKE, out of a 25 lb. three-quarter sister to Prince Gelsche Walker, and her two daughters, one by King Mead of Riverside, the other by a son of Sir Skylark Ormsby Hengerveld.

14 DAUGHTERS OF SIR SKYLARK ORMSBY KORNDYKE, son of Sir Skylark Ormsby Hengerveld. Here is one of the rare opportunities to secure granddaughters of this great sire.

THREE GRANDDAUGHTERS OF JENNIE TERZOOL HICKS 4TH that made 32.70 lbs. butter from 600.3 lbs. milk in 7 days, and 959.05 lbs. butter from 21,550.6 lbs. milk in 305 days.

TWO DAUGHTERS OF KING GELSCHE WALKER KORNDYKE the good son of King Morco Alcartra and the 32 lb. Miss Gelsche Walker Korndyke, daughter of Prince Gelsche Walker.

TEN BULLS IN THE OFFERING

SIR SKYLARK ORMSBY KORNDYKE, born May 17, 1917. He is sired by the famous Sir Skylark Ormsby Hengerveld, one of the best sires the breed has yet developed in California. He is a high class individual, a sure, quick breeder, and is siring a most promising lot of calves, many of which are in this sale.

KING NETHERLAND SKYLARK MEAD, born May 25, 1919. By King Mead of Riverside and out of a 27 lb. daughter of a 28 lb. cow. One of the last opportunities to secure a young son of King Mead of Riverside.

8 YOUNG BULLS by the herd sires and out of some of the best dams in the herd. This is an opportunity for dairymen to buy young bulls of excellent blood lines.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

THIS IS A COMPLETE DISPERSAL, excepting only two heifer calves that are not catalogued, and every animal positively sells to the highest bidder.

TERMS OF SALE: One-third cash, balance in three, six, and nine months, with approved note. Terms are cash unless arrangements for credit are made with sale manager prior to the opening of sale.

PLACE OF SALE: H. A. De Wolf Farm, three-quarters of a mile west and three-quarters of a mile south of Ripon, California.

TYCAMORE ACRES

TYPE -I- World's Record in Production

I have more females in my herd who are either sisters or daughters of the following bulls than any herd in the United States:

KING SEGIS PONTIAC

King Segis Pontiac Alcartra—His $50,000 son.
King Segis Pontiac Chicago—His $20,000 son.
King Segis Pontiac Count—"The Marvel Sire."

Could you go wrong on some of these? I can spare a few. Fresh cows, springers or yearlings. Priced right; tuberculin tested and guaranteed right in every way. Come and see them. One hundred twenty-five head to select from. Six miles east of Perris.

Why Not Purebreds

If a purebred registered Shorthorn cow will return from two to four times as much as a good grade—and she will—why not grow purebreds? Now is the time to buy them.

Loleta, California, May 25, 1921.

California Cultivator,
Los Angeles, California.

Gentlemen:

I have received your check of twenty-five dollars, the California Cultivator prize for producing the largest amount of butter fat for the month of April for the best group of five grades entered in the state dairy cow competition. I must say I was surprised as it is the first money that ever came to me without working hard for it.

I fully realize the efforts the California Cultivator is making for the betterment of agriculture and dairying in particular.

You may be sure of having my fullest support, and whenever the occasion arises I won't fail to boost for your worthy paper.

Thanking you for your kindness and hoping before the season is over to be able to win at least one more of your prizes I am respectfully yours,

J. A. GENZOLI.

Winsor Ranch, grade Jerseys: Teresa, 982 pounds milk, 53.54 pounds butterfat.

The reports for April so far received show that 543 cows in milk during the full month produced an average of 1293 pounds of milk and 49.43 pounds of butterfat during the month (average number of days in milk at beginning of month, 92).

One cow produced over 100 pounds of butterfat during the month, viz., a grade Jersey owned by H. L. Wakeham of Santa Ana (2088 pounds milk, 104.40 pounds fat). This is the third month during the present lactation period that this grade, not inappropriately named "Jim's Wonder," has produced over 100 pounds of butterfat, and her total credit to date is 408.11 pounds butterfat during 120 days, or considerably more than twice the average yield for an entire year for dairy cows in this or other states. Five cows produced between 90 and 100 pounds butterfat during the past month; 13 between 80 and 90 pounds, and 29 between 70 and 80 pounds.

The California Cultivator prize for April was won by J. A. Genzoli of Loleta for an average production by five grades of 83.04 pounds fat (ranges 75.9 to 92.9 pounds). These cows are described by their owner as "common cows," but whatever their breeding may be their production is certainly very uncommon. They stand first among groups of five grades in the 27 different dairy herds that competed for the Cultivator prize for the past

An extra quart for every gallon of milk produced

If you are dairying without a silo you are cheating yourself out of a quart of milk for every gallon you sell.

Milk production usually increases from 10 to 25% when dairy cows are put on proper silage rations. Government experiment stations, state agricultural colleges, and experienced dairymen will verify this statement.

How long will you continue to forfeit this extra quart for every gallon you now produce?

With declining prices on farm products you can't afford to do without an Indiana Silo. Increased milk production means increased income. Figure it out yourself—an extra quart for every gallon and on top of it, less mill feed.

Our representative near your farm will be glad to talk things over. Write for his name.

month. The average production for all but five of these groups of grades came above 50 pounds, and only one fell below 40 pounds. The location of the contestants by counties was as follows: Humboldt 11, Los Angeles 7, with single herds in Colusa, Sonoma, Napa, Contra Costa, Alameda, Stanislaus, San Diego and Imperial Counties. The dairy herds competing for this prize were, therefore, located in widely separated sections of the state, showing that no one locality has a monopoly on good cows. This is the first time that the Cultivator prize has been won by a Humboldt County farmer, and also the first time in seven months that it has gone outside of Los Angeles County. Judging from the showing made by herds in Humboldt County during the past month, however, it is not likely to be the last time that the prize will go to this county.

Nobody has ever claimed that the man who wrote "Home, Sweet Home" composed the same during the house cleaning season.

NEW AGRICULTURAL LEGISLATION

(Continued from Page 767.)

been included in the budget for the next biennium and will likely be continued in the future.

One of the six groups of farmers which met last fall to review the work and needs of the college of agriculture and the state department of agriculture was the deciduous fruit group and, following a careful study by 11 representatives of as many fruit organizations, a request was made for an extra $50,000 for deciduous fruit investigations and $20,000 for increased work with fruit products. The request for new work by all groups totalled $267,000, out of which the state budget board picked the one item of $50,000 for deciduous fruit investigations as the only one which they would recommend. Making this a budget item practically insures the governor's signature, and this extra step forward by the deciduous fruit interests must be partly credited to the persistent and ardent battle waged in former years.

The $20,000 for increased work with fruit products is also an important item and is included in the amount of $450,000 for the college of agriculture above budget board recommendations carried by Senate Bill No. 981, which has not been signed by the governor as this is written.

How Will the Money Be Spent?

There is naturally considerable interest among fruit men as to what problems will be undertaken with the extra $50,000. Some of the projects which have been suggested include:

Extension of field experiments in the irrigation of orchards.

Study of the relation of irrigation to diseases and abnormalities of deciduous fruits.

Pear blight studies, including extensive plantings of resistant stocks; laboratory studies of these as to causes of possible resistance; tests by artificial inoculation and careful field tests of different methods of surgery.

At least two extension specialists in pomology are needed to supply the increased demands from all parts of the state for pruning, spraying and other work of this type.

Citrus Versus Deciduous

There exists in certain sections of the state today the feeling that the citrus interests are much more amply served by the college of agriculture and experiment station than are the deciduous fruit interests, and it may be worth while to make a few comparisons along these lines.

It must be granted that the citrus growers were alive to their problems a number of years ago and through their persistence were able to secure a citrus experiment station which would be a credit to any industry. At this institution there are 11 or 12 men working on various phases of the problems of the citrus industry, including entomology, pathology and physiology. Several of these same men, however, are working on the alkali project as their principal problem, this being of statewide importance and not confined to the citrus or any other industry.

As compared with these there are at least 15 men devoting practically their entire time to pomological problems alone, besides a number who are devoting their attention to deciduous fruit problems of entomology, pathology, fruit products and irrigation. With the increased work which can be done with the extra $50,000 the problems of the deciduous fruit growers will be as well or better cared for than any other industry in California.

Fruit and Vegetable Standardization

Next to the college of agriculture appropriations the bill of most widespread interest to fruit growers is Senate Bill No. 201, amending the present fresh fruit standardization law. This bill as originally presented was an entirely new law containing many changes and in that form was presented to the fruit and vegetable trade and growers. In order that the bill might represent the views of the industry rather than those of a state agency F. W. Read, in charge of standardization of the state department of agriculture, arranged several conferences at which the whole bill was discussed section by section and was finally cast aside, merely leaving some amendments to the present law. Although in its final form the bill was something of a compromise it largely represented the views of the industries affected and therefore met with no opposition in the legislature.

The principal change in the law is with reference to grapes, providing that all grapes, whether for table or manufacturing purposes, shall meet a minimum sugar content of 16 or 17 per cent according to variety. Grapes for manufacturing purposes with a lower sugar content may be shipped if permit is granted by the director of agriculture.

A need for such an amendment arose from the market demoralization last year resulting from the shipment of immature grapes.

Parasite Appropriation Eliminated

One of the oddest happenings to agricultural bills occurred when the assembly committee on agriculture refused to eliminate the appropriation of $10,000 from Hume's bill, which permits the continuance of the wonderful parasite work done on black scale of citrus. The appropriation had been placed in the bill by its proponents but it was with this in mind the assembly committee on agriculture was asked to eliminate the appropriation, and much to the surprise of the friends of the measure the committee insisted that the appropriation be retained and that the bill be favorably recommended to the ways and means committee.

This measure is an important one because of the very promising progress toward parasitic control of black scale which now requires the expenditure of approximately $1,800,000 per year for control by fumigation. Considering the waves of economy which at times swept over the legislature the appropriation promised to retard the progress of the bill and perhaps prevent the governor from signing it. Fortunately the ways and means committee was willing to report the bill favorably with the appropriation eliminated and from then on the measure met with no difficulty.

The above mentioned bills are the most important affecting the fruit growers, although certain industries are considerably affected by Cleveland's bill reenacting the apple standards act, Harris' grape mealy bug bill, Parker's graduated nursery inspection fee bill and Arbuckle's bill containing the present law pertaining to the control of the walnut codling moth. Altogether the fruit men can feel well satisfied with the results of the legislature's activities as they affect their industries.

* * *

Livestock Legislation

Although the livestock interests of California are not so thoroughly organized into marketing associations as are the fruit industries their organizations are none the less effective in legislative matters. More than a dozen beneficial laws dealing with livestock were passed by the legislature, a greater number than affected any other phases of agriculture.

It would be well to say right here that a large debt of gratitude is due the men who spent much of their own time or money, or both, shaping and urging legislation for the good of their particular industry. Of course it is not the privilege of every man to so give his time and money, but each individual at one time or another during the last session of the legislature had an opportunity to help by letter or by wire. Ask yourself, Mr. Reader, if you were in a class which served, or the one which let the other fellow bear the burden?

Meat Inspection Bill

Probably the most important measure affecting the meat producing interests is the meat inspection bill providing for sanitary inspection of slaughter houses. Although the measure does not carry an appropriation funds are provided in the budget of the department of agriculture to make a very good beginning on this type of work. The large cities have been well cared for in the matter of meat inspection but the smaller cities and towns have been open to the worst sort of exposure through the sale of meat.

from diseased animals. The result has been that many consumers have become disgusted by the quality of the meat obtained and have curtailed their consumption materially to the detriment of the livestock industry.

It would require an enormous sum of money to inspect every carcass slaughtered, but with the funds available a state inspector can drop into slaughter houses unexpectedly at any time, and knowing this some butchers are going to be far more careful of the quality of the animals handled. As a matter of fact, there are probably only a few plants which make a regular business of slaughtering tubercular or other diseased animals, and as these are already quite well known a most careful watch can be placed over them.

Another measure through which the public will be protected and the market for good meats improved is the one providing that imported cold storage meat must be so labeled. This bill originated with the California Wool Growers Association but is of almost equal value to the cattlemen and received their united support. The necessity for such a measure arose through the heavy importations of frozen lamb, mutton and beef from New Zealand and other countries. It was found that these meats were being sold in many instances in competition with fresh meats and were not giving satisfaction. The price being the same, the consumer could not distinguish between the imported and domestic meat so the industry suffered through reduced consumption.

Sheep Dog Law

Probably no one was so pleased and relieved as Senator Ben Rush when the sheep dog law went through. Senator Rush, the veteran of the legislature who recently sat in his ninth consecutive session, can scarcely remember the time when the first sheep dog bill was handed to him.

As formerly drawn it contained some very strong provisions as to licensing, impounding and killing dogs, which certain women claimed made the bill obnoxious, and some crowded and tumultuous hearings were held. As a matter of compromise many of the teeth were taken from the bill, causing someone to remark that as changed the bill would "protect dogs from sheep," which, however, was not exactly the case. Even with amendments it was not possible to pass the bill until the last session, when the measure was carefully drawn and brought forth no antagonism except from a few cattlemen who maintained that the collars provided for dogs would cause trouble in the brush. The new law throws several important safeguards about the sheep industry which is becoming more important throughout the valleys of California where depredations from dogs are most likely to occur.

Another bill for the protection of livestock is Senate Bill 268, by Rigdon, which carries an appropriation of $50,000 to employ hunters, trappers and poisoners for the control of coyotes, lions and bobcats. The sheep men will receive the greatest benefit from the protection offered through this measure since hundreds of lambs are the victims of predatory animals each year, but the aggregate annual loss of this character in calves, turkeys and chickens also runs into large figures.

Of all of the agricultural bills that were passed at the recent session this seemed the least likely to be signed by the governor because of the large appropriation carried. Important arguments which helped win his signature were that the federal government will now cooperate by appropriating a large sum of money for the same purposes, and that rabies recently has been spread through certain districts by coyotes.

Pure Bred Bulls Required

It seems a sad commentary on human nature that we must legislate to compel individuals to improve the quality of their livestock, and thereby make more money, but this is the object of Senate Bill No. 606. For the year 1922, 25 per cent; for the year 1923, 50 per cent; and for the year 1924, 75 per cent of all the bulls running upon any open range must be pure breds of recognized beef breed. The definition of "pure bred bulls" is rather liberal, however, they being defined as "bulls bred in a herd of one of the recognized beef breeds, the ancestral sires of which must have been registered bulls of the same breed for at least four generations and the dams of which must have been cows of the same breed of good quality."

Among the most profitable outdoor sports in some sections of California has been the stealing of cattle. The hide and brand law has made this more hazardous, and a few amendments passed by the recent session will give the cattlemen increased protection. A bill providing that before estrays are sold notice must be given to the director of agriculture describing the brand of such animals will also aid in controlling this nefarious business.

INFECTIOUS ABORTION

E. T. Hallman, veterinary section Michigan agricultural college, states that recent researches on abortion disease indicate that the bull is not as important a factor in transmitting abortion as was formerly believed and that abortion may be very largely prevented by removing non-infected pregnant females from sources of infection.

In case there is no abnormal discharge from the reproductive organs of the bull and no cow with an abnormal discharge from the reproductive organs is bred, it is doubtful if much good is accomplished by douching the bull's sheath before and after service. If there is any reason to suspect the bull his blood should be tested for evidence of abortion infection.

There is considerable evidence that infection of females with abortion bacilli most frequently occurs after conception and all measures that will lessen the chances of post conception infection materially reduce the number of abortions in the herd. The isolation of all aborting and parturient cows in maternity stalls and individual paddocks until abnormal discharges from the reproductive organs have ceased, the avoidance of carrying these discharges on the feet of attendants to the feed and water of other cattle, scrupulous cleanliness in the care of the barn floor with the daily use of a good disinfectant in the gutters will greatly lessen the danger to pregnant cattle.

If all heifers of breeding age can be removed at the time of service to a barn used exclusively for pregnant heifers and kept isolated from the remainder of the herd until the termination of pregnancy, abortion in heifers may be very materially lessened. Where practicable separate barns and pastures should be provided for unbred and pregnant heifers.

Since abortion infection is most frequently introduced into clean herds through the purchase of infected female cattle it is suggested that owners of clean herds be particularly careful in purchasing stock.

From the standpoint of disease prevention it is safer to buy a young unused bull than one that has been used on infected cows although bulls that have been used on infected cows are not necessarily harmful.

As a means of preventing abortion infection vaginal douching prior to breeding is of questionable value although this practice may be helpful in overcoming certain causes of sterility. A solution made by adding one ounce each of baking soda and table salt to one gallon of clean warm water makes a satisfactory douche. One gallon should be used for each douche. This latter solution may be safely used the day the animal is to be bred.

SHIPPING HOGS IN HOT WEATHER

Due to hot weather the usual losses to livestock, especially hogs, are enormous. By following the suggestions given here as nearly as possible all or at least a part of the damage can be eliminated.

Haul or drive your hogs to the shipping station in ample time to allow them to become rested and cool before loading.

When ordering a car for loading hogs insist on a clean one bedded with sand, clay or earth.

Wet thoroughly the bedding and interior of car before loading.

Give only a small feed of grain before shipping. Heavy feed means more body heat generated.

Load not more than one hour before the train is to depart.

Load slowly and carefully. Avoid excitement and do not beat or bruise the animals.

Load not to exceed 14,000 pounds fat hogs and 16,000 stock hogs in a standard 36 foot car during warm weather.

Have water applied to the bedding in the car at available points immediately after the train stops.

Use ice on floor of car whenever possible, three blocks to a car.

Report inattention or neglect promptly to the superintendent of the division on which your shipment originates.

Never throw water directly on the hogs after they become heated. Run it on the floor or car under them instead.

OREGON'S DAIRY BULL REGISTRATION

At the last session of the Oregon legislature an act was passed establishing what is known as the dairy bull registration board which designates the dairy husbandry department of the state agricultural college as the board.

No person, firm or corporation shall offer for sale for dairy breeding use any dairy bull that is not of registered pure blooded breeding and licensed to be sold for such purpose within the state. Any person, firm or corporation offering for sale within the state for breeding purposes any dairy bull shall cause the name, description and registration papers of such bull to be enrolled with the dairy husbandry department of the Oregon agricultural college and shall procure a license from said dairy husbandry department as provided for. In order to secure a license certificate the owner of the bull must make application to the professor of dairy husbandry of the Oregon agricultural college for same and shall furnish certificate of registration with application. The dairy husbandry department is granted powers to refuse a license to any animal suffering from any dangerous disease, or that is known to transmit inferior and undesirable qualities to his offspring or to lack prepotency.

IMPORTING BETTER LIVESTOCK

A desire by Mexican officials to improve the quality of livestock is reported by the American consul in charge at Mexico City. According to information received through the state department, Mexico offers a market for a limited number of well bred swine. There is also interest in cattle.

The government agricultural school at San Jacinto (Mexico City) has a few pedigreed Duroc-Jerseys, as well as hogs of other breeds, imported about two years ago for demonstrating the qualities and characteristics of the different breeds to farmers who might be interested and for breeding purposes. Early this year two carloads of pure bred Duroc-Jersey hogs were imported by this agricultural school and it contemplates importing new stock of various breeds. The purpose is to introduce new blood and to furnish farmers with young pigs of good quality. The two breeds of swine for which there is particular demand are the Duroc-Jersey and the Poland China. There is less demand for hogs of the bacon type.

The American consul indicates that the interest in improved livestock is due largely to a desire to replace animals lost during the late period of political disturbances. By introducing good breeding stock Mexican farmers expect to improve the quality as well as to increase the numbers. Livestock breeders in the United States are advised that to obtain direct orders some advertising in Spanish is required. However, the department of agriculture is in a position to put American livestock breeders in touch with officials and others in Mexico who are interested in importing livestock.

CAUSE OF HIGH COUNT

M. E. Coulter, inspector for the state department of agriculture, reports that a pasteurizing plant in his district has been experiencing difficulty in lowering the counts on the milk they were pasteurizing. Apparently the milk had as high a count after the process as before it, and it became evident that some organism was present that resisted the pasteurizing temperature. Mr. Coulter undertook a thorough investigation by means of bacterial counts in order to locate the cause of the trouble. By this means he traced the trouble to a certain milking machine and there located the trouble principally around the glass cylinders in the milk tubes, in the check valve in the bucket lid and in the pulsator. Before the trouble was located and corrected the pasteurized milk had a count of about 500,000, afterwards it had a count of about 1,000.

EXPECT FEWER CALIFORNIA LAMBS TO REACH BIG MARKETS

The movement of California spring lambs to middle western and eastern market centers this year will probably be lighter than in 1920, according to information gathered by representatives of the United States bureau of markets. Increased marketing expenses and considerably lower prices than could be obtained a year ago are the chief causes for the expected decrease.

Freight rates from California points to Omaha have increased more than 20 per cent during the past year. Expenses in transit, such as unloading and feed at the various stations where stock is stopped en route are still high in the opinion of shippers. Selling commission fees have also advanced one-third compared with those charged in the spring of 1920.

In the spring of 1920 the freight rate on sheep from Mendota, California, to

Breed the Kind that Always Sell

The successful breeder, no matter how much glory he may win through the breeding and development of high class animals, must ever keep in mind the occasions when he is to reap some of the financial rewards of the breeding business.

Successful development of heavy producing families of registered Holsteins, that transmit production in a uniformly regular manner is by no means the general rule, but when such a family is developed it immediately attracts attention and acquires a value far beyond the average.

KING ARALIA MEAD

This young bull may well be regarded as one of the great sons of King Mead of Riverside, as his dam was not only one of the greatest producers we have developed but was also an individual of great excellence.

His Sire: KING MEAD OF RIVERSIDE, whose daughters comprise one of the notable yearly record groups of the breed, including Aaggie Acme of Riverside 2nd, the holder of the world's strictly official record of 1,331.77 lbs. butter, and Aralia De Kol Mead, 1,215.2 lbs. butter in one year, also a strictly official record.

His Dam: MARGARET ARALIA DE KOL, 1,161.48 lbs. butter from 22,922.7 lbs. milk in one year. She is by Aralia King, that wonderful individual son of Aralia De Kol, the first cow to make 28,000 lbs. milk in one year, and is out of a good yearly record daughter of Juliana King of Riverside, sire of Aaggie Acme of Riverside.

Margaret Aralia De Kol also holds the California record in the eight months after calving division, with 25.86 lbs. butter in 7 days, which won second money in the Holstein-Friesian Association of America prize list 1917-1918. KING ARALIA MEAD is now in active service in the choice herd of young females owned by

H. E. VOGEL
WESTLAWN FARM FRESNO, CAL.

Not every breeder within his lifetime will be rewarded by the development within his herd of such a family, nor is it actually necessary to develop such a family in order to achieve success.

But it is absolutely necessary, if such a family is not brought out, to link the herd up through the herd sire or a succession of herd sires, to some outstanding family of the breed, and when this is done after careful selection the herd shares in the general prosperity of the many herds that are connected up with the same family.

It has been our good fortune to develop several family groups that are quite generally recognized as being among the most substantial families of the breed, and the unusual situation of several such families within one herd has afforded us an opportunity for the blending of great producing families such as has been the privilege of few breeders.

Whether you are the owner of a small herd that must make your living as it develops into an asset that you will one day turn into a substantial cash sum, or whether you own a large herd with a corresponding investment of money, good business practice dictates that you must have not only good breeding but POPULAR BREEDING as well.

Perhaps a bull at the head of your herd from one of our great proven families would be just the added touch that your herd needs to round it out for successful development. Let us talk the matter over with you.

A. W. Morris & Sons Corporation
Woodland, California

Missouri River markets amounted to $241 per car, while this spring the freight charges amount to $321.50 per car. Commission charges at Omaha were $18.75 per car a year ago, compared with $25 per car now. In addition to these sharply increased expenses the producer is confronted with a decline in price of approximately $8 per 100 pounds. The first California spring lambs to arrive at Omaha in 1920 brought $19.75 per 100 pounds, whereas the opening price this year was $11.50 per 100 pounds. The movement of these lambs to market began about two weeks earlier this year than last, chiefly because of a mild winter and an abundance of feed in most districts.

The minimum time required to ship lambs from California to Missouri River points is from seven to eight days. The first shipment arrived on April 20 this year and on May 6 in 1920. These first lambs averaged around 65 pounds and sold at $11.50 per 100 pounds with a 25 per cent sort at $8. Since the first arrivals other shipments have been received, one of which consisted of 66 pound lambs that brought $12.

One gratifying feature from the standpoint of California shippers was a recent reduction in charges levied at feeding stations in the vicinity of Omaha. These charges now amount to three cents per head per day for the first ten days and two cents per head thereafter, compared with former rates of four cents and three cents, respectively.

COW TESTING PAID THIS MAN

"Cow testing associations are constantly proving their worth to their individual members from the standpoint of dollars and cents," says E. M. Harmon, dairy extension specialist for the Missouri College of Agriculture. "If a man will study his dairy herd and the results secured by the tester he can greatly increase his profits. A good illustration of this is the experience of John Bluhm, one of the enthusiastic members of the Pettis County Cow Testing Association. A review of his average production and profit during the last two years shows that his cows during the first year averaged 7,720 pounds of milk and 280.1 pounds of fat, while this annual production had increased in the second year to 11,004 pounds of milk and 374.8 pounds of fat per cow. By giving careful heed to the facts revealed by the tester Bluhm had increased the average annual production of his dairy herd 3,284 pounds of milk and 94.7 pounds of fat per cow. His annual profit per cow has grown from $107.25 to $179.23.

"While this is really an abnormal increase in profit yet we believe it can be said conservatively that any man can do as well if he will practice correct breeding and feeding methods and study his herd by means of records on each individual cow. The cheapest and most accurate method of securing these records is through the cow testing association."

ALFALFA WEEVIL MENACE

At the request of Governor Stephens, who is taking a keen interest in the protection of California's alfalfa industry from the alfalfa weevil, G. H. Hecke, director of agriculture, sent Harry S. Smith, in charge of pest control work of the department, to Reno to investigate the situation insofar as it menaces California.

The alfalfa weevil outbreak in the vicinity of Reno, Nevada, presents a very serious situation for the alfalfa industry of California. It was at first thought that the infestation there was limited to a single field and that for the protection of both Nevada and California an attempt to entirely exterminate it by poisoning and later burning the field would be advisable. Investigation by Mr. Smith and the Nevada authorities showed, however, that it has already spread over an area of approximately 1,000 acres and that it has become too thoroughly established to prevent any possibility of a successful extermination campaign.

The greatest menace to California lies in the extensive auto camping travel between the infested area at Reno and California points. Alfalfa is growing abundantly along the highways and large numbers of auto campers roll out their beds in these places. The weevils crawl into the bedding, are then rolled up and perhaps the next night's camp is made beside a California alfalfa field into which the weevils could easily make their way.

It is very likely that this is the means by which the weevil came to Nevada from Utah, several hundred miles away. It is probable that the state department of agriculture will place inspectors at the border in order to enforce strict quarantine regulations with reference to camp outfits.

JERSEYS

Venadera Herd
Offers some excellent young bulls ready for service. Sired by Japs Perfection Owl. Out of cows with Register of Merit records. Also a few heifer calves.

Thousands of Dollars Added to Cattle Profits

OUT of every five bushels of *whole* grains fed your cattle, *one bushel goes to the manure pile without being digested and is a total waste.*

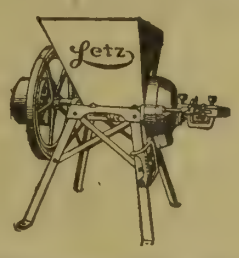
But *ground* feed is *all* digested. Feeding it, means a 20% cut in feed costs, also fatter, higher priced stock. Come in and let us show you without any obligation, how easy it is to get these results with the

LETZ *America's Leading Feed Mill*

The *fine cutting* of the Letz is due to the 848 keen cutting edges of the patented Letz Grinding Plates. In one operation cuts, grinds, *pulverizes* into finest meal all grains and grasses, wet or dry; and cannot clog.

Grinds corn, shelled or on cob—snapped corn—or complete stalk, ear, leaves, and all. Grinds oats, hulls and all; grinds barley. rye; special attachment for alfalfa, clover, millet, Kaffir corn and other roughage crops. Grinds into finest flour.

Plates are self-sharpening—can be run together empty for hours without injury—average 2000 bushels of moderately fine cut meal before replacement is necessary.



Grinds the finest flour. Has 10 big exclusive features any one of which makes the Letz superior to any other process. Let us prove it. See a Free Demonstration today.

NEW AGRICULTURAL LEGISLATION

(Continued from Page 787.)

stock interests developed over Senate Bill No. 98 which provides for tuberculosis eradication areas. Although the measure was introduced early in the first portion of the session objection to it was not raised until after it had passed the senate.

When the measure was up for hearing in the livestock and dairies committee of the assembly it was urged that the bill be held until the sentiment of the dairymen could be obtained, but contrary to the request the bill was voted out favorably. Immediately following this action a meeting of the dairymen was held and it was understood that the bill would be returned to the committee since it was unsatisfactory to the dairymen in its existing form. This was not done, however, and following the insertion of a few amendments the bill was passed unexpectedly by the assembly.

The sentiment of the dairymen had by this time developed almost unanimously against it and the cattlemen were equally unanimous in favor of it. The whole matter was discussed in a preliminary meeting and then presented to the governor by both sides, and the governor finally decided to sign the bill. The provisions of the bill are so well known that they need not be mentioned, but the effectiveness of the law will be carefully watched and changes suggested at the next legislative session if these seem advisable.

A bill along somewhat similar lines by Assemblyman Cummings also received the governor's signature. This, however, provides voluntary testing by dairymen who may desire to have accredited herds. The measure, which is similar to laws in effect in many other states, had the united support of the dairymen. It originally carried an appropriation of $50,000 to assist in remunerating dairymen for loss of condemned animals, but the appropriation was eliminated by the ways and means committee.

Assembly Bill No. 443 will protect purchasers from animals which have been tuberculin tested by a state inspector by requiring that no such animals may be sold prior to notification of the director of agriculture. This will partially stop the sale of tubercular animals as family cows, a most pernicious practice which has been all too common. The same measure makes the Mallien test the official one for determining glanders in horses.

Another bill aiming at the control of tuberculosis is one by Cummings, providing that all skimmilk, whey or buttermilk sold at creameries for feeding to livestock must be pasteurized. This bill received very little attention considering its far reaching effects. The milk from tubercular animals is unquestionably an important source of tubercular infection and little has formerly been done to eliminate this source. Buyers of hogs from some sections of California where milk from creameries is fed refuse to purchase except upon the basis of the condition of the animals at slaughter since they have found that more than 50 per cent of these animals are tubercular.

Only one measure affecting the poultry industry was passed, this being a bill to regulate the sale of imported eggs, powdered eggs and egg products. These must now be sold subject to inspection by the state board of health. As originally introduced the measure resembled a law now on the books in Oregon, and in this form passed the assembly. In the opinion of the attorney general it would have been unconstitutional in California, and for this reason the bill was changed to meet the objections. Although some protection from foreign eggs is afforded it is well understood that the real protection in this direction must come from tariff.

Altogether the livestock men can feel that their interests were well cared for by the legislature and the governor.

Lowering the Cost of Irrigation

By R. W. Sparling

EVERYONE knows that our era of waste and extravagance is over. The high prices that were both a cause and effect of this wastefulness cannot be paid or obtained now and will probably not exist again for a long time to come. California growers are going to face heavy losses until we have adjusted ourselves to these new conditions and get on a lower cost and more efficient basis than we have been for the past few years. But if we wait for others to lower their prices to us to a point that will give us a profit without making a material change in our own methods the most of us are going to be left holding the bag. Efficiency, like charity, should begin at home.

Now, to get down to specific cases, the majority of us are either producing, buying, using or selling water for irrigation. The cost of this water is an important item, its loss or waste is a more serious matter than many of us think, and its distribution in correct amount and at proper times is an all important factor in the productive capacity of our groves. Yet it is a fact that of all the water produced by the irrigating companies more than one-third is never accounted for in sales to consumers and it is probable that of what is delivered under present methods barely half is, or can be, distributed over the land under conditions that produce best results. If you doubt these facts, do a little systematic investigating of your own and you will soon be a hot advocate for more efficient methods. So much, however, for destructive criticism. Let us see what can be done toward improvement.

The very first step and the rock bottom basis of efficiency in any business line is complete and exact information. How much water are we pumping or buying? How many cubic feet or acre feet were actually produced last month from each source and what did each unit on the average cost? That is production and balanced against it are total actual deliveries. Suppose we are selling to a number of users or distributing over several sections of land. Each one requires some certain amount. If A is given ten per cent more than he calls or is charged for, B a half more perhaps, and C twice as much as he should have, even though a third be lost through bad pipe or any other way, none of the three may have direct cause to complain, but the distribution is poor. The water lost is costing each one something and it should be corrected and not ignored. The idea among the stockholders of mutual companies that all are getting good measure and all the water goes to members of the company anyway is utterly misleading and tends to hide wastes and losses instead of detecting and remedying them.

It is a very simple matter, and cheap in proportion to the amount returned, to install adequate measuring and recording apparatus that will eliminate guesswork entirely in the handling of this water. A continuous ink record taken automatically of the flow over a standard weir will tell a tale that means much and can never be disputed. A meter may not record the circumstances but it will certainly state a fact as to how much water has gone through that pipeline. There are several makes of both types of equipment on the market that are reasonable in price and reliable. A few of them placed at strategic receiving and distributing points will provide a fund of exact information that will quickly open the eyes of any water superintendent.

But let's go even farther—toward lower costs. There is no phase of farming or fruit raising that will bring surer returns than precise methods of the application of water. Quite often, and with a third less water, one can increase the fertility of the soil fully 20 per cent by adopting definite scientific means for measuring the application to a given section. A common "horse sense" analysis will soon give definite data as to the exact amount of water required to give the best results with this or that condition of soil or season of the year. Water is by far the most important soil constituent, yet "enough is plenty." An excess is not only wasted from an economic standpoint but actually lessens productivity. Four meals today and two tomorrow may average up all right but digestion will surely suffer.

An accounting system in any line should disclose the losses and furnish the information essential to overcoming them. But no system can be installed or maintained to any advantage without intelligent oversight and continued application. It is a wonderfully efficient tool but must be effectively used to be of value. There must be a definite goal to be reached and a well defined plan for reaching it, then the efficiency lies in utilizing every available means to best possible advantage. In this case the goal is reduction of irrigating costs, the plan is to employ more businesslike methods of production and distribution, and the available means is a water accounting system that will give exact information on the cost and amount of this water from the time it leaves its gravel bed till it enters the roots of the trees.

Once this information is secured and utilized as we use any other cost data in business, and we can apply the precise methods to our irrigation water that we insist upon in all other cash or merchandise dealings, there will soon be some results apparent of real efficiency. A cut in irrigation costs that would be an appreciable help in making ends meet would be very welcome just now and indifference should not be permitted to be the obstacle.

It is obvious then that a scientific irrigation program, with lessened costs and increased production, comes only through the positive knowledge to be derived from exact measuring and recording equipment. Demand and apply this knowledge with the same direct thoroughness that have made our growing and marketing methods the wonder of the country and our irrigation costs will soon take the tumble that is due them.

CAPRIFY NOW

Instructions to fig growers for caprifying Calimyrna figs have been issued by Ira J. Condit, horticultural department director for the California Peach and Fig Growers, in which attention is called to the fact that June caprification has started in the southern sections of the San Joaquin Valley.

Last year caprification started June 10 in the Fresno district, and this year Condit predicts an earlier season in the Exeter district, with other sections delayed by cool weather.

In his instructions Condit states that Calimyrna figs should be caprified when about one-half inch in diameter. The caprifying season will last approximately three weeks, depending on the weather and the amount of new fruit.

While the capri crop was injured by the frost in some districts present indications point to a sufficient supply this year, and growers are urged to make immediate arrangements to take care of their needs.

Condit has issued a minimum schedule for the guidance of growers in placing capri figs on the trees to insure thorough fertilization. In full grown trees 20 feet or over in diameter 96 caprifigs in three baskets to be placed in lots of four to a basket every three days are recommended. The quotas for other trees are: Eighteen foot trees, 90 caprifigs, three baskets, three or four figs per basket every three days; 16 foot trees, 80 in two baskets, five per basket every three days; 14 foot trees, 72 in two baskets, four per basket every three days; 12 foot trees, 64 in two baskets, four every three days; ten foot trees, 56 in one basket, seven every three days; eight foot trees, 48 in one basket, eight every four days; six foot trees, 18 in one basket, four every six days.

QUESTIONS AND ANSWERS

(Continued from Page 779.)

means to keep plants dry while soil is kept constantly damp. They plant on ridges, far enough apart so that air tween plants. If this is not done the lower leaves rot and seriously detract from the market value. The seed or flower stalk of lettuce does not begin to grow until the heads attain full size and this is dependent on treatment. If lettuce is kept well watered to maturity of heads and then allowed to dry, the flower stalks will appear very quickly unless heads are too close together. Lettuce is not an astringent, but an aperient.

Dahlias and 'Mums

Where can I get information on cultivation of dahlias and chrysanthemums?—Subscriber, Lancaster.

The Cultivator has, from time to time, published full cultural directions for both these popular flowers. Chrysanthemum propagation was given in much detail in the issue of February 26, 1921. A chapter on "Chrysanthemum Culture" is to be found in the book "The Garden Beautiful," published by the Cultivator, of which a few copies are still on hand. The Dahlia Club of Los Angeles publishes a monthly bulletin that contains dahlia culture articles by its members, all expert growers. A good number was that of June, 1920. The secretary is E. C. Weber, 222 East Adams Street, Los Angeles.

Budding Walnuts

Can year old walnut trees be budded? If so, when is the best time to bud and what bud should be used, from old wood or new?—Subscriber, Escondido.

Yes, but it is better to graft and the time of the year for grafting is late January to early March according to season. Of course the wood should be well ripened wood and may be of preceding year's growth if well ripened.

Chamber Lye

Is the ammonia that forms in urine harmful to plants? I was told this is an "old time" remedy for the prevention of destruction by insects. If true, will you please tell me how to administer it properly to the plant?—Subscriber.

On the contrary, it is beneficial, that is, if diluted and applied to the plants. As an insecticide we have never heard of its use.

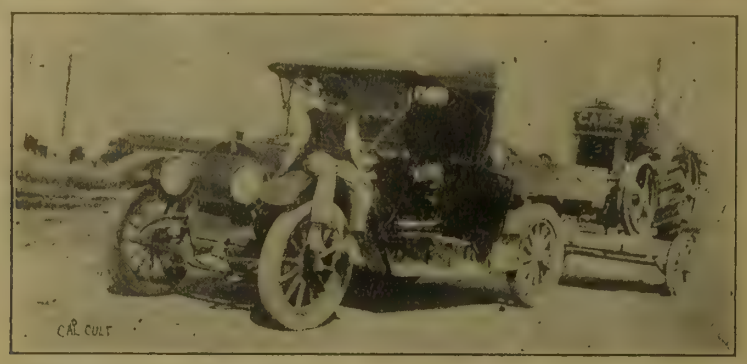
WHERE THERE'S A WILL, THERE'S A WAY

Here's a picture that bears out the old adage, "Where there's a will, there's a way." The picture tells the story of one way of transporting a tractor without removing the grouters.



This outfit is owned by Dr. Singleton of San Jose. The Doctor is blessed with two ranches, one at San Jose and another at Fresno. Using, as he does, the same tractor on both tracts, the problem of transportation became quite a severe one, for a state law prohibits grouters being used on improved roads. The Doctor accordingly devised and had built this unique "chariot" trailer. The chariot is a comparatively simple arrangement, being merely a heavy platform mounted on a strong axle. The wheels are a heavy truck type wheel, rubber tired to comply with the state highway requirement.

By the use of this trailer arrangement the tractor can be used on one farm until the job is completed, run onto its private car and moved quickly over to the other farm without loss of time or labor, for by this method it is not necessary to remove grouters or front wheel flanges. The plow or other tillage tool is carried easily in the box on the truck.

The transporting of tractors via motor trucks is not an entirely new one, for during the past few years when the railroads were not running as smoothly as possible hundreds of tractors were delivered to customers via motor, but we believe that Dr. Singleton is the first farmer to solve his own transportation problem in this manner.

FARMERS START MARKETING CORPORATION

The California Farm Bureau Federation through its marketing department has recently launched the California Farm Bureau Exchange. This is a non-stock, non-profit association composed of an affiliation of county farm bureau exchanges. The state exchange will handle all common crops not at present cared for by agricultural co-operative associations. The county member of the state exchange will assemble the farmer's products and distribute through the parent organization which is the state exchange. Charges for the service will include only the operating cost, the remainder being returned to the grower.

The exchange will be operated by departments with a specialist at the head of each. The general manager is Fred N. Bigelow, who until recently has been the secretary of the state market commission. One of the largest departments will be the purchasing department. This department is in charge of Mr. Baker, who has resigned his position in the state purchasing commission to take on his new work with the state farm bureau.

The state exchange starts with seven county exchanges affiliated. Fourteen added farm bureau counties are perfecting their plans to join, and before the year is over likely most of the county farm bureaus will be identified with the state farm bureau marketing and purchasing association. The state and county exchanges will handle in due time an annual business running into millions of dollars. The undertaking is representative of the farm bureau movement in California as worked out by the state farm bureau federation. The marketing organization created is an outgrowth of the great economic problem with which the producer is confronted. Economy in distribution will give agriculture a fighting chance and will at the same time help fight the battle of the consumer.

LOADING STATIONS FOR GRAIN CROP

The California Farm Bureau Federation, which has made the bulk handling and marketing of grain one of the most important reforms of its program, is urging its members and grain growers to install inexpensive bulk loading equipment at railroad sidings which will serve until concrete elevators can be built.

The bureau has leased the 1,200,000 bushel elevator at Oakland and is in position to handle, clean, condition and store bulk grain. A number of grain elevators are being built in various parts of the state. However, it is impossible to erect elevators in all grain sections, and as time is short ranchers who hope to share in the benefits of bulk handling this year must rely upon the loading stations to facilitate the handling of their crops.

These loading stations (miniature elevators) are said to be easily and cheaply built. They are simple, yet have a loading capacity of from one to two thousand bushels per hour. They are operated by motor or gasoline engine power.

OUTPUT OF GYPSUM

Gypsum is used largely in making Portland cement, Keenes cement, plaster of Paris, wall plaster, plaster board, tile, and blocks, as well as in agriculture. The production last year, 3,130,305 tons, was the record annual production. For the first time in the history of the industry the quantity of gypsum mined in the United States in a year exceeded 3,000,000 tons. In 1919 the output was 2,420,163 tons. The total value of crude and calcined gypsum sold in 1920 was $24,542,512, an increase of nearly $9,000,000 over the sales in 1919. The figures indicate that the industry had a prosperous year. All the principal gypsum producing states increased their production, and the quantity of gypsum sold for each of the common uses was larger than the corresponding quantity sold during the previous year. Agricultural gypsum was in great demand, the sales rising from about 40,000 tons in 1919 to 107,443 tons in 1920. The other notable increase was in the sales of gypsum boards and blocks, of which 308,756 tons was sold, valued at $6,091,617, as compared with about 180,000 tons, valued at about $2,300,000, in 1919.

Gypsum was mined in 18 states and

time
to treat that roof
The rains are over, the hot sun is out. Now is the time to put your shingle roofs in condition to give longer service.
ORONITE SHINGLE OIL
Preserves Shingles
Use Oronite Shingle Oil—a high-quality preservative for all shingles, old or new—on roofs or on side walls. Oronite Shingle Oil penetrates the fibre of shingle wood and acts as a moisture-resisting preservative. It retards the evaporation of natural oils in the wood—the cause of cracking and warping—and counteracts the effect of age and exposure.
Last winter was one of the heaviest ever experienced on the Pacific Coast. Your roof took the brunt of all that heavy weather. Now is the time to examine that roof and put it in shape to withstand the rains of another winter. An application of Oronite Shingle Oil now may save the cost of repairs or an entire roof next season. Oronite Shingle Oil may be readily mixed with colors. Ask our nearest agent for formulas.

Oronite Roof Paint
A high-quality protective coating for prepared roofing and metal roofs.
Mica Axle Grease
Gives a durable, smooth lubricating film under every pulling condition. Keeps the axle cool; no hot-boxes, no gumming. The MICA makes it better.
Eureka Harness Oil
Preserves the original strength and life of leather and keeps it soft and pliable. Keeps harness "new looking."
Standard Hand Separator Oil
Correct Lubrication for your Hand Separator, under the conditions of high speed and close fitting parts.
ORONITE means QUALITY

in Alaska. Four of these states, New York, Ohio, Michigan and Virginia, the only ones east of Mississippi River, mined more than half of the gypsum used in 1920.

The imports of gypsum increased but have not nearly attained the figure reached before the war. Imports of crude and calcined gypsum in 1920 amounted to 297,407 tons, as compared with 451,925 tons in 1913.

AIRPLANES AS FOREST PROTECTORS

The most picturesque fire fighting apparatus used anywhere will soon be in daily use over the forests of California when the great De Haviland airplanes begin their daily scouting trips in search of a tell-tale smoke.

Entering upon its third season as a forest fire detector the airplane is no longer an experiment as a fire spotter. The big planes have proven their efficiency. With rapidity that is equalled only by their accuracy, the observers flash by wireless their findings to U. S. forest service headquarters and the message is in turn sent to ground forces who rush to combat the flames. The messages received from the air are turned over to U. S. forest service rangers if the fire is within a national forest and to state fire rangers if the fire is outside of the forest boundary. In this manner millions of acres of both publicly and privately owned forest and pasture land is guarded over.

Not only have the airplanes proved efficient in detecting fires but also have aided greatly as a means of choosing best methods to combat fires, the ranger in charge directing his ground forces from the air.

With the airplane as a detector of fires and the automobile as a means of rushing men to the scene of the conflagration, the war against forest fires has moved forward a great pace during the last few years. Public sentiment is also keeping pace, with the result that there is greater cooperation in preventing as well as fighting fires.

SUCCESS WITH TURKEYS

The Cultivator is always glad to receive from its readers any account of their own successful experience. We all live and learn, and we all find out sooner or later that there is no one way of doing things that is better than any other. This is especially true of turkey raising. Nobody has yet found any method that is sure to raise 90 per cent of the birds hatched.

An Artois subscriber, I. H. Howard, who has had considerable success with turkeys, sends us this account of his methods:

"I know of nothing that will take the conceit out of one more thoroughly than to attempt turkey raising on a large scale without previously trying it out on a small number of birds. There seems no limit to the variety of ways in which a turkey's career can be ended before he reaches maturity.

"The writer has lost enough turkeys in their infancy to have provided a Thanksgiving dinner for every family in a small city if they had all lived. This does not sound like a good qualification for giving advice, but I have been pretty successful the last few years. Last year from 20 hens and two toms we raised 257 birds, worth $1,500, at very little expense.

"We hatch under both turkey and chicken hens, but try to have them hatch at the same time, and give the poults to the turkey hens. We put ten eggs under a chicken hen or 17 under a turkey.

"For the first week's feeding we find nothing better than hard boiled egg. The next few weeks the main feed is skim milk curd, scalded and drained dry through cheese cloth, fed morning and noon, with a little cracked wheat in the evening. Lately we have been feeding cracked rice instead of the curd, and it seems to be fully as good. We feed only as much as they will clean up quickly.

"The mother hens are kept confined in a large A coop, sometimes with a lath extension, but we allow the young ones to run in and out as they please. The coops are kept in a grass or alfalfa run and are never less than 50 feet apart. The mother is not turned out till the poults are six weeks old and is shut up again if a storm threatens.

"The second clutch of eggs is hatched in a nest on the ground under a tree or in some other cool place. In hot weather the ground around the nest is dampened. As there is no dew on the grass with us in summer these later broods are turned out when they are a week old.

"After the young birds are a couple of months old they are quite hardy and will eat almost anything, but we never feel sure of our turkey money till we have the check in our pocket. We figure that if we have a fairly good hatch and raise 50 per cent of the poults hatched we will make a good profit."

LOS ANGELES COUNTY POULTRY CLUB CONTEST

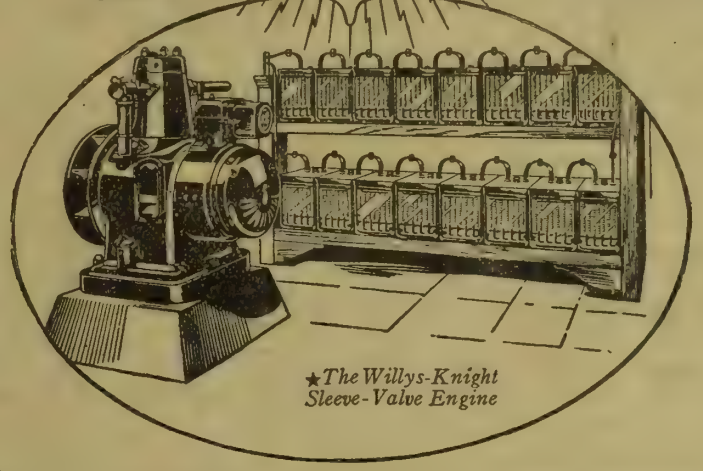
This contest is designed primarily for high school students and will include preferably not more than six members enrolled in any one local club for the first period. The total number of members in the county will be limited to 15. The work of this contest will be organized in three consecutive periods extending for 21 months. The first period or contest will take up the development of pullets and will extend six months; the second period, extending for a period of eight months, will be a laying contest; and the third, extending for a period of seven months, will be a breeding contest. The minimum number of pullets in this contest will be 100 birds hatched approximately April 1 and to be about three months old on July 1. Applicants for membership should be between the ages of 14 and 20. All applications must be in the hands of the poultry club committee, composed of L. G. Wiley, Van Nuys; J. D. Zimmerman, San Gabriel, and L. R. Y. Hoover, Pomona, by June 18, 1921, so send your name and address to any one of the committee or to County Club Leader, 361 Court House, Los Angeles.

The vast forests of the Pacific Coast states remain largely intact whereas the forests of the New England, Great Lakes and Southern states are already largely depleted through improper logging and failure to protect from fires.

California enjoys the enviable position of being able to examine the results in other states where forests have been depleted and to profit by the mistakes that have been made. Already the lumbermen of California have agreed to a method of slash disposal after logging that if carried out will leave logged-off lands in better condition for the growing of new forest crops. That this is necessary is realized from the fact that at the present rate of cutting and destruction from fire the forests of the United States can supply the needed timber for a period of from only 60 to 75 years.

Willys LIGHT

Power and Light with the Quiet Knight ★



★*The Willys-Knight Sleeve-Valve Engine*

THERE could be no better evidence of keeping faith with the public than this—to share our ability to produce quality products on a quantity basis with everyone in North America who needs electricity.

In the famous Willys Light we have swept aside precedent and given every home the benefit of bed rock quality at rock bottom prices.

At its present low price of $525 there can and will be no further reduction. Already we are meeting the farmer more than half way—giving him the great advantage of a practical, complete power and light plant, backed by national resources and service, at an unheard-of price.

This wonderful reduction in price is no more extraordinary than the wonderful service Willys Light is giving hundreds of homes.

The famous Willys-Knight engine is only one exclusive superiority, in addition Willys Light has fifty distinct advantages. These combined with its new low price warrant your immediate action. See your nearest Willys Light dealer or write for booklet.

Willys LIGHT JUNIOR

$295

—And here is the Electric Plant that will revolutionize farm lighting—Willys Light Junior. Somewhat smaller but in every other respect measuring up to Willys Light quality, this plant is big enough for lights and small power uses. At this low price, you can now have the electricity you have been waiting for.

Willys Light Junior has the wonderful Auto-Lite engine generator, a battery of ample capacity and is of standard voltage.

PETALUMA, CAL.

ALMOND HULLER

AND

English Walnut Cracker

Mr. Grower, I have a machine for your 5-10-40 acre almond orchard cheaper than a Ford.

CAN YOU BEAT IT?

It hulls the nuts by rubbing. Under complete control of levers set at the proper place to suit any size nuts or conditions. Can be changed instantly.

Do you see the Ford idea?

SIMPLICITY!

The two surfaces come just close enough to work on unhulled nuts. The hulled almonds glide along without being touched. The meats fall through the screens quickly. They are not broken or nicked. Off price on account of damaged meats practically eliminated.

FEEDS AUTOMATICALLY and does not require a man at the hopper to keep it clear. Does not get out of repair. Any man can run. Requires only 1½ to 2½ H. P.

Write for circulars giving full information.

1 Day---16 Traps---

40 Gophers

We wish that it were possible for us to print in these pages all of the letters that the mails bring us from farmers. Since we cannot do this, let us give you the gist of one report:

On May 4, Dr. Morris Herzstein, owner of a beautifully-kept ranch in the Santa Clara Valley, sent in for two traps. One week later he sent for two more, and on May 17, he ordered 6. Four days later he sent in for 6 more traps, saying that on the day before, 20 gophers were caught with 10 traps. On Monday, May 23, the doctor ordered 12 more traps, reporting that on Sunday, May 22, a record had been made by catching 40 gophers with 16 **Double Catch Gopher Traps.**

Here is a gopher trap that actually catches gophers. Illustrated circulars free. If you cannot secure these traps from your local Seed Stores or Hardware dealers, send direct to us. **Price, postpaid, 75c.**

Peppers: Supplies liberal, market steady. Imperial Valley: Bells best, 25@30; Chilis best 20@25 per lb.

Radishes: 15@20 doz.

Rhubarb: Local strawberry, 1.00@1.15. bx.; jobbing 1.00@1.15; Crimson Winter, 60@80.

Squash: Supplies moderate, market weaker. Summer squash: Local, 75@85 per lug; Italian, 1.40@1.50 per lug.

Tomatoes: Supplies liberal, market weak. Imperial Valley, per crate, best 2.00@2.25; poorer, 1.50@1.75; jobbing, 1.75@2.00.

Turnips: Doz., mostly 45.

FRESH FRUITS

Cantaloupes: Supplies heavy, market steady, pony crates 3.50@3.75, standards 3.75@4.00. Jobbing: ponies 3.00@3.25, standards 3.50@3.75, flats 1.25@1.40.

Cherries: Supplies heavy, market weaker. Whites, various varieties mostly 9@11 per lb.; Bings, best, 16@18, poorer 15 per lb.; Black Tartarians and Republicans mostly 12@14 per lb.

Apricots: Market steady, mostly 7@8 lb.; poor low as 6; few fancy, 9.

Blackberries: Supplies moderate, market weaker. Best 3.25@3.75; few 4.00.

Loganberries: Supplies moderate, market weaker; 30 pint crates 2.75@3.25.

Loquats: Supplies liberal, market steady, wide range in prices, mostly 5@7; poorer 4@4½ per lb.

Peaches: Suplies moderate, market steady, various varieties 9@10 per lb.; lugs 2.50@2.75, few fancy Redbirds 15@16 per lb.

Raspberries: Supplies moderate; best, 3.25@3.75 per 30 pint crate; few fancy 3.50.

Strawberries: Supplies moderate, market firm. Per crate, 30 pints best mostly 6.00@7.00, 12 pint crates 2.00@2.25.

Watermelons: Supplies moderate, market steady, mostly 4 per lb.

CITRUS FRUITS

Grapefruit: Supplies liberal, market firm on good stock. Local: per box, market pack 2.00@2.50, special packed brands 3.00@3.25.

Lemons: Supplies liberal, market firm, wide range in prices. Local: packed box 3.25@4.00; loose 1.25@1.75 per box, per lug mostly 50@75.

Oranges: Supplies liberal, market firm. Valencias, best brands, all sizes, 3.50@4.00; packing house culls 50@75, few best 1.00@1.75 per box.

HONEY

As reported by the Bureau of Markets: Southern California, Los Angeles: Supplies of White honey light, of Light Amber grades heavy. Movement slow, market dull. Carloads f. o. b. usual terms, per lb. White Orange Blossom 10@12; White Sage 10½@12½; White Alfalfa 7½@8½; Light Amber Sage, 8@9; Light Amber Alfalfa 6½@8. Hawaiian, White 7; Honey Dew honey 4½. Recent hot winds have badly hurt Orange and Sage honey prospects and with southern Sage already seriously damaged by cold and dry weather, a very light crop of the lighter colored honeys is forecasted. The Alfalfa crop is probably normal. High retail prices are still maintained throughout California, and hurt honey distribution locally. Some large shippers expect a firm market, account light crop this year; other factors are still pessimistic. New honey will move in light quantities this month and next, but shipments in large quantities are not expected before July. Beeswax: Sacked in l. c. l., Light 25@30; Dark, low as 23 per lb.

GRAIN AND FEEDS

Grain Exch. price bid June 7:
Corn: Bulk No. 2, Yellow 1.62½.
Kaffir: Eastern, No. 3, carloads, 1.50.
Milo: Local, 2.12½; No. 3 Eastern bulk, 1.68¾.
Barley: Carloads, 1.15.
Bran: Kansas, 28.50.

Cranberries	6.75
Bayos	10.60
Blackeyes	7.90

HAY AND FEED

Alfalfa Growers of California quote June 4:

No. 1 Dairy	17.00
Standard	15.00

Under date of June 4, A. W. Scott Co. says:
Receipts past week 780 tons, more than enough for local use.
Continued rains and cloudy days have brought baling and shipping to a standstill while alfalfa grinding has been practically impossible. Great quantities of hay of all grades have been damaged, some a little, some almost spoiled. When this damaged hay is forced on the market at sacrifice prices (as is always the case) it will undoubtedly be a serious drawback to maintaining a favorable level of prices for better grades. Alfalfa is doing poorest of all hay grades. Producers have been trying to hold prices up to $14.00-$15.00 country points, with no sales. As a result several hundred tons of Nevada alfalfa have been placed here at $14.00-$15.00 delivered San Francisco. Clover is preferred by many dairies and as it is being freely offered at $10-$12 at shipping points many feeders are holding off from alfalfa and will not buy the latter at the difference in price. New wheat and tame oat hay have not yet appeared on the market. Sales of volunteer and barley hay have been increasing at quotations. Mill feeds are stronger in sympathy with the Eastern coarse grain markets. Protein dairy feeds are dull, coconut and oilcake off a trifle in price, beet pulp unchanged and molasses a couple of dollars off.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	18.00@20.00
Wheat Hay, light 5-wire bales	15.00@18.00
Tame Oat Hay	15.00@17.00
Wild Oat Hay, old crop	15.00@17.00
Wild Oat Hay, new crop	10.00@12.00
Barley Hay	11.00@13.00
Alfalfa Hay	14.00@16.00
Alfalfa Hay, new first cutting	10.00@12.00
Stock Hay	10.00@12.00
Barley, Ground	31.00@34.00
Barley, Rolled	28.00@30.00
Oats, Rolled Feed	35.00@37.00
Bran, Red	34.00@36.00
Bran, White	36.00@38.00
Millrun	36.00@40.00
Middlings	47.00@50.00
Linseed Meal	37.50@40.00
Coco Meal	23.00@27.00
Alfalfa Meal, old crop	24.00@26.00
Alfalfa Meal, new first cutting	22.00@23.00
Cottonseed Meal	35.00@40.00

Molasses, Tanks	21.00
Molasses, Bbl.	25.00
Milo	39.00@40.00
Corn Meal	39.00@41.00

Citrus Markets

Los Angeles, June 8, 1921.

Notwithstanding heavy receipts of Eastern produced peaches and strawberries California oranges are meeting liberal demand. Valencias are practically the only variety being shipped and are reported by consumers to be sweet and ripe. All sizes sell well. The heavy rains of May have put the orchards in best of condition all districts showing a good setting of fruit.
Market on lemons still fine. Trade is taking supplies as rapidly as shippers can supply them. Prospects for more warm weather in the Middlewest and East are encouraging to the California lemon men. Prices remain as high as last week. There are 27,000 boxes of foreigns available for sale within the next 30 days.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 25,182 cars; lemons, 5,944; total, 31,126. To same date last season: Oranges, 20,741; lemons, 4,688; total, 25,429. From Central California to date this season: Oranges, 6,494; lemons, 146; total, 6,640. To same date last season: Oranges, 5,338; lemons, 288; total, 5,626. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

REPORT OF CATTLEMEN'S MARKETING COMMITTEE

May 30, 1921: Few sales of beef steers are reported this week at 7 cents on the ranch and of choice cows and heifers at 6 and 6¼. Sales of cattle at less figures are reported, but our information is that these cattle are of inferior quality. Certain interests are apparently trying to depress the market through the quotations in the daily papers, the method being to publish lower prices every few days f. o. b. yard San Francisco, the prices named being much less than actual sales at the same time in the country. For instance, Saturday, May 28, the top quotation on No. 1 cows and heifers was 5½ f. o. b. San Francisco. The same day cows and heifers were sold at 6¼ on the ranch.
Every information we have confirms our previous statement that there is more feed and less cattle in California than for several years. Cattlemen should stand firm. The last of available fed cattle are being used in Portland and Seattle markets, and they will have to come to California for a supply in a short time. Very few commission cattle coming in. Don't send cattle on commission. Under no circumstance offer cattle until they are well finished.
We have made no use of the guaranty fund because there is no surplus of cattle in sight for this summer and fall, and we believe when northern buyers draw on us for their supply then an actual shortage will develop. We stand ready to use the guaranty fund in case circumstances develop that render such action advisable.
Los Angeles buyers are now purchasing cattle in Central California.
Cattlemen of the state have the future of the market in their own hands. In our judgment those who stand firm will realize better prices than are now being offered.—Fred H. Bixby, chairman; C. N. Hawkins, Owen Duffy, James Barry, A. S. Goode.

Dates of hog auctions of the California Farm Bureau Marketing Association are: Turlock, June 14; Merced, 15; Madera, 16; Fresno, 17; Bakersfield, 18; Tulare, 21; Visalia, 22; Hanford, 23; McFarland, 24.

A SAN FRANCISCO SHOW ANYWAY

One of the most depressing disappointments encountered by the livestock interests of California was the failure of Governor Stephens to sign the bill introduced by Senator Benj. F. Rush appropriating $50,000 to be used for premiums by the California National Livestock Show during the next two years.
The California National Livestock Show is the name selected by the incorporators for the proposed livestock show to be held at San Francisco. The new corporation is the result of tireless efforts by a representative group of livestock men to organize and conduct a permanent show to be held each fall at San Francisco. The incorporators propose to raise $100,000 among the livestock interests, $200,000 from the business interests of San Francisco, which sums, together with $50,000 included in budget of the San Francisco supervisors, will establish the show on a permanent basis. The money from the state was asked to apply on premiums.
Until the very last minute it was expected that the governor would sign the bill in view of the fact that it had the support of every powerful interest in the state and it was not known that there was any opposition. It is understood that the failure of the bill to be signed was the result of a misunderstanding on the part of the governor, who was under the impression that the Slater bill providing $50,000 for fairs was the bill that was wanted.
At this writing no definite plans have been announced by the directors of the California National Livestock Show except that there will be a show.

MARKET FOR ORANGES IN CANADA

Consul General Gunsaulus of Halifax states that the maritime provinces of Canada constitute a splendid market for California oranges. It is stated that these oranges are very popular in that market, being shipped to the principal cities in carload lots. The sales during the present season are reported larger than in any year since 1914.

—Real Pump Economy—

"... places far apart are brought together, to the present convenience and advantage of the Public and to the certain destruction, in time, of a host of petty jealousies, blindnesses and prejudices, by which the Public alone have always been the sufferers."
From Charles Dickens' Preface to Pickwick Papers.

The Advance of Understanding

Even romance of sixty brief years ago could not imagine the great advance heralded by the passing of the stage coach. The railway and telegraph were coming into their own; but the telephone had not been so much as dreamed about.

Yet the wise men of that day saw the imperative need. They saw the value of every step which brought people into closer communication with each other. They knew this to be the one way to increase understanding; and to eliminate the "host of petty jealousies, blindnesses and prejudices, by which the Public alone have always been the sufferers."

Then came the telephone. And with its coming time and distance are swept away and a hundred million people are made neighbors.

Places far apart are brought together by 34,000,000 conversations a day over the Bell System.

The Aldrich grand piano

THE Aldrich grand piano, a wonderfully toned instrument, is only 5 feet 4 inches in length by 4 feet 8 inches in width.

Yet, dainty and compact though it is—*and priced very moderately*—the Aldrich grand piano is an instrument that we are delighted to recommend.

It is manufactured to our own specifications, according to ideals and standards that we have developed out of more than forty years of piano merchandising.

A small but exquisite grand piano at a very moderate price: the Aldrich.

The Aldrich is also made as an upright

California Farm Crops and Animals, 1920

FARMS AND FARM PROPERTY IN CALIFORNIA

ON this page of the California Cultivator of August 28, 1920 we gave the preliminary figures as to number of farms in each county of the state. These totalled (subject to correction) 117,993. The corrected figures are now issued by the bureau of the census:

The number of farms in California in 1920 was 117,670. These farms contained 29,365,667 acres, of which 11,878,339 acres were improved land. From 1910 to 1920 the number of farms increased 33.4 per cent; the total acreage, 5.1 per cent; and the improved acreage, 4.3 per cent. In 1920, 29.5 per cent of the land area of the state was in farms, and 40.4 per cent of the farm land was improved.

The number of white farmers in 1920 was 111,184, of whom 76,995 were native and 34,189 foreign born. Of the native white farmers, 60,264 were owners, 3,913 managers, and 12,818 tenants. Of the foreign born white farmers, 26,073 were owners, 887 managers, and 7,229 tenants. The 6,486 colored farmers comprised 1,243 owners, 149 managers, and 5,094 tenants. The number of female farmers was 5,774, including 5,406 owners, 52 managers, and 316 tenants.

The value of all farm property in 1920 was $3,431,021,861, as compared with $1,614,694,584 in 1910, an increase of 112.5 per cent. The value of land and buildings in 1920 was $3,073,811,109; of implements and machinery, $136,069,290; and of livestock, $221,141,462. As compared with 1910, the value of land and buildings in 1920 showed an increase of 111.9 per cent; of implements and machinery, 272.9 per cent; and of livestock, 73.3 per cent. The average value of land and buildings per farm was $26,122 in 1920, as compared with $16,447 in 1910; and that of land alone per acre was $94.77 in 1920, as against $47.16 in 1910.

The value of the 37,338 farms for which complete mortgage reports were secured in 1920 was $764,166,011, and the amount of the mortgage debt was $224,063,903, or 29.3 per cent of the value. The average rate of interest paid was 6.6 per cent. In 1920, 55.0 per cent of all farms operated by their owners were mortgaged, as compared with 40.5 per cent in 1910.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

COL. LOOKINGBILL

Col. W. C. Lookingbill, known to many of California's livestock men as a most successful auctioneer and manager of a salesyard maintained at Pomona, died at the Pomona hospital recently. Col. Lookingbill has been a breeder as well as an auctioneer of livestock. In breeding he made a phenomenal success in the East and was beginning to build up a reputation in California.

CHEAP

The railroads have held up reduction on citrus freight tariff and have now made a proposition to the fruit shippers that a cut of 22 cents a hundred will be made on oranges and 16½ cents on lemons, to begin November 1, "if citrus fruit shippers will abandon plans for further development of water transportation facilities."

This proposition has been indignantly rejected and the growers announce that no boycott whatever will be established against the Panama Canal. The acceptance of the proposal of the railroads would have a serious effect on the development of shipping facilities which have great possibilities for the Pacific Coast. Many of the growers feel that this is adding insult to the injury which has been forced upon them because of the long continuance of these excessive rates.

Notwithstanding some reductions have been promised along other lines the citrus industry is not the only one which is being injured. We note dispatch from the cantaloupe shipping section of the Imperial Valley "We all feel that the present high freight rate will be the cause of 4,000 to 5,000 carloads of Imperial Valley cantaloupes rotting in the field."

A GREAT RECORD

California agricultural interests have just cause to congratulate themselves over the splendid record made during the last session of the recent legislature, culminating when Governor Stephens completed signing practically every bill of any importance that was sponsored by organized agriculture. On several occasions The Cultivator has published brief digests of the more important bills, and without again publishing the complete list it can be said that with a few minor exceptions all the measures will now become laws.

Probably the most fundamental piece of new legislation consists in clearing up certain disputed rights of cooperative organizations. From now forward it is anticipated that these organized groups will be freed from the malicious attacks of paid and unpaid hecklers.

Of vital interest and importance to the forward development of the industry is the increased support given the college of agriculture. Not only did the college receive all that the budget board recommended but it was given $400,500 that the board had eliminated from the original request. The college should now be in a position to function most efficiently.

Credit for such definite results must be largely tendered the agricultural legislative committee and at once justifies the formation of that organization and demands the continuance of its activities.

California agriculture is out in front where it belongs and where it must be kept.

A FOOL LAW

In March the Cultivator referred to a bill introduced into the state legislature which provided that "it shall be unlawful for any bank, trust company, corporation or individual, other than one duly admitted to practice as an attorney at law under the laws of the state of California, to practice law or give any service or advice or information concerning any matter of law, etc."

Now then, that fool law was passed; it has been signed by the governor; it will become a law unless it is stopped by the referendum. Presumably that is what will happen. We may add that is dead sure to happen.

Subscribers of the Cultivator are concerned in this because one of its most valuable departments has been that giving answers to legal questions. If this law is construed as it seems it must be this helpful service, which the Cultivator has been glad to render, will be prevented. While Mr. Stanton who answers the questions for the Cultivator is a thoroughly qualified practicing attorney and would find it entirely legal "to give information concerning any matter of law," the Cultivator Publishing Co. is an impersonal thing, "a corporation," which presumably would be disqualified.

The referendum will suspend operation of the "law" until the next election at which time the electors will have opportunity to express themselves regarding it.

It will be 60 days, even without the referendum, before the measure becomes operative so Cultivator subscribers may continue to send in the questions for "Legal Answers."

Meantime let's pass a law which will prevent a lawyer from growing a hill of potatoes or head of lettuce in his back yard—or even from advising his neighbor as to which end up to plant a tree, or any other "agricultural advice."

Gosh!

A Competence With Livestock

By R. P. Royce

NOT long ago one of the most successful livestock breeders in this or any other state remarked to the writer that he was at a loss to understand why so few men seemed to appreciate the possibilities of building for themselves a satisfactory competence by using some one of the established breeds of livestock.

"I know from experience," he stated, "that it is entirely possible for any man of average ability who has a reasonable amount of cash or credit, who really likes to handle livestock and who is willing to work and wait, to accomplish as much with livestock as he can in other lines. I sometimes look back at the meager start our family made and think of the many trial and disappointments we have had and balance it all against our position today, and it all seems so simple that I wonder why more men do not follow the same path. But, I guess, in the first analysis, the average man is looking for a quicker, easier road to follow.

"The reward comes to the man who lends thought, work and enthusiasm to whatever he does. Of course, some of us would add other factors, but in the main the one mentioned will make for success.

"I am aware of the fact that this old world is in need of a set of new and higher ideals, but we cannot escape the fact that at present we are living in intensely practical times and that for general purpose our people can be divided into three classes, viz., those below the average, those making up the average and those above the average, and it is largely up to the individual as to which class he finishes in. It doesn't make so much difference where one starts, it is the finish that counts.

"That is about my philosophy of life and I don't mind saying that I learned much of it from handling livestock. When we first started in the business we had grade cows. Some were good but mostly we weren't satisfied. So we decided that, in view of the fact that we were not dairying for fun, it would be good business to find out which cows were profitable and which were boarders. There were no cow testing associations in those days so we organized one with our own herd and started to test. Well, it didn't take long to find out which were the profitable cows and which were costing us money, and once we knew no time was lost in getting rid of the tramps. Then from time to time we picked up cows that we knew would pay. At first we set an average production standard for our herd, not high as we think back but at a point where we felt it spelled profit. Every cow below that average was sold.

"About that time we began to figure why some cows were below the average and some above and we soon decided that breeding was the biggest factor, then came care and feeding. I don't mind saying that at first we didn't take a lot of stock in the importance of breeding, but we had the facts hammered in on us so plainly that we couldn't ignore them. Then we began to figure that if there was a difference made by breeding, the smart thing for us to do would be to get as well bred cattle as we could find. So having decided on the breed we wanted to handle we got as well posted as possible and finally an opportunity came along for us to secure some pure breds. We bought, and I'll say that was the real beginning of whatever success we have made.

"But it hasn't been an easy road all the way. We followed the same general plan with our registered cattle as we had worked out for our grades. We set a sort of average standard of production and aimed to have the herd make the mark. Then as we kept getting into the business deeper, we naturally had to keep raising the standard. It was about this time that we learned the possibility of pulling some of the 'below standard' cows up to or above the average by proper feeding. There's a big difference in cows the same as in men. Some cows never get very far because they don't have a chance to make the most of their capabilities and some men don't get very far for the same reason—but, generally speaking, I'll say this, I never knew a cow that didn't try—and I've known a lot of men you couldn't say the same about.

"It's been a good many years since we made our start with registered cattle and as I said it hasn't been easy sailing all the way. At times we were mighty discouraged. It didn't seem that we were getting anywhere in particular. For the most part we operated on borrowed money—had to in fact. Then it didn't appear that we could sell our produce. I believe that last fact had meant more to us than most any other. That might sound strange but I'll tell you what I mean—though it took several years to learn the meaning ourselves.

"When we started with registered cattle, and I have noticed the same applies to about 95 per cent of the men who start in the breeding business, we were pretty enthusiastic. The business looked mighty profitable, good registered cows selling for $200 to $400 apiece and bulls and heifers bringing about as much. The returns on the investment looked pretty big. Now we only had a few cows to start with—an even dozen—and not all of them dropped a calf—and some of the calves died. Our notes kept coming due and no sales. The future didn't look bright but the only thing we could do was to buckle in and work harder and try to make the cows produce more milk and the farm produce more feed. Somehow, we managed to get along and things ran on the same for several years. Occasionally we did a little official testing and the records while not large were not bad. We kept plugging along for several years with mighty little money coming in except from milk and cream and a few bull calves, but that went for living expenses. Our herd kept increasing but it kept us humping to raise the feed. Then one day we held a sort of family conference to decide whether to get out or go on. We decided to get out, so we began checking up the herd to find what we had and after putting a conservative value on the cattle we were amazed to find out what the herd totaled. Well, that was the first time we realized what we had been doing and that was really the first time we realized just what the possibilities were with livestock. It's a business that takes awhile to get under way. The profits are based on accumulation.

"If more young fellows and beginners could be made to understand that a lot of grief would be saved. If these young fellows would go into the business with the determination to stick with it for ten years they would find a good profit. But, as a matter of fact, too many put all their capital in as many cows as they can buy, often without regard to the quality of the cattle, and then impatiently wait until they can clean up in a year or two.

"The registered livestock business is not for the speculator — there isn't much spectacular about it. On the other hand, it is a slow but certain road along which any young fellow with a leaning to livestock handling can follow with assurance. Not every man can make a success breeding cattle or hogs any more than any man can succeed as a merchant or a lawyer.

"Now to get back to what I said awhile back. Men will fall in one or another of the three classes I mentioned, the average, those below and those above the average. If a man is content to stay below the average, there's no hope for him; if he is satisfied to rank as just an average man he will not get anywhere. We must be above the average and whether or not he gets there is up to himself. But he can be sure of this: Mighty few ever get above the average without a lot of hard work and hard knocks. I honestly believe that the production of pure bred livestock offers the young man as favorable opportunity as can reasonably be looked for. He probably

California Cultivator

Vol. LVI, No. 25 Los Angeles, June 18, 1921 One Dollar Yearly

Potatoes in Field and Forum

By Ernest Braunton

ABOUT 150 potato growers gathered at the W. V. Stahl ranch near Zelzah in the San Fernando Valley, June 7 to inspect the field demonstration plats where experiments are being carried on jointly by the agricultural extension service of Los Angeles County and Mr. Stahl. Assistant Farm Advisor Bert C. Bougher, the field crop specialist of the office, has had the plats under close observation since planting and gives us the following information on

The Field Experiments

Owing to the unfavorable growing conditions this spring the plots were not as well developed as could be expected, but there were a number of valuable and interesting demonstrations which were explained to the visiting growers. The invaluable results to be obtained from the use of leguminous cover crops were clearly brought home to all. There were four fields on which different cover crops had been planted: Melilotus indica, wild lupine, soy beans and whippoorwill cowpeas. The same variety of potatoes was planted on these four different fields on soil types which were similar, including check plots which were planted on fallow land. The best stand of vines and setting of tubers was secured on the plot planted to Melilotus indica. All these cover crops were planted in September of last year and plowed under in February. The Melilotus made the heaviest growth of green manure and was reflected in the stand of potato vines. The soy beans and whippoorwill cowpeas did not make nearly the growth of green and can be considered eliminated so far as using them for a winter cover crop for potatoes. It isn't a question of inducing the growers to plant a cover crop but of finding the most suitable one to plant. From all the trials that have been conducted the Melilotus indica still seems to be supreme. This fall the much talked of purple vetch will be given a trial in competition with Melilotus and many growers are anxiously awaiting the results as the purple vetch seems to have the ability to grow much faster in colder weather.

One of the outstanding features of the morning meeting was the difference between the Temecula potato seed and that grown in Los Angeles County year after year. It is quite evident from the demonstration on Mr. Stahl's ranch that the seed that came from Temecula showed the best stand of vines and also a better setting of tubers. It was also less affected by wilt, rhizoctonia, and second growth, which are causing so much damage to the potato crop this spring. Even the best selected home grown seed which has been replanted here for the last three years did not compare favorably with the seed brought in from Yucaipa and Temecula. This imported seed was also choice selected. Much of the potato acreage this year is affected by curly top and wilt whereas the imported seed shows nearly a hundred per cent stand. This should not be taken as conclusive evidence of the value of bringing in outside seed every year but it is a practice that should be carefully checked up. It was the opinion of a number of prominent growers present that they had the same experience which is corroborated by over 20 eastern and middle western experiment stations. E. D. McSweeney, potato grower of El Monte, who gave a talk on "Potato Growing in Southern California," stated that he thought it a good idea to send his seed over to Temecula for a year and bring it back. More interest was shown in this phase of the field meeting than in any other.

In the Stahl Potato Fields

Potato growers watching the digging of the crop and listening to Mr. Stahl's explanation of treatment given. Below, those participating in the afternoon program at Van Nuys High School: 1, F. T. Fogg; 2, F. W. Read; 3, H. H. Warner; 4, J. L. Oleson; 5. R. G. Risser; 6. Mark Grimes; 7, R. W. Hogdson; 8, H. E. Truax; 9, Geo. H. Peters; 10. W. V. Shear; 11. E. D. McSweeny; 12, B. C. Bougher; 13, T. H. Lambert; 14. F. J. Beaton; 15, D. J. O'Neil; 16, R. E. Neblung.

The effect of inoculated and uninoculated sulphur on potato scab was something new in this section of the country. Sulphur has been used for the last three years at the New Jersey experiment station for the control of scab. In some cases commercial sulphur gave very good results but in others the inoculated sulphur gave a greater percentage of clean tubers. This was found to be due to the fact that in some soils the sulpho-fying micro-organisms were not present, thereby causing a slow oxidation of the sulphur into a mild acid which is the agent holding the scab in check. The inoculation of sulphur is effected merely by adding one per cent of soil, from a compost heap known to contain the sulphur oxidizing organisms, to the commercial sulphur and thoroughly mixing. The cost of inoculating is negligible and the results are much more constant. The plots on Mr. Stahl's ranch did not show any difference between the two kinds of sulphur. This is due either to the presence of the organisms in the soil or to the fact that the sulphur was not applied correctly, the latter no doubt being the reason. The sulphur was applied at the time of planting in the furrow with the seed and did not have time to become thoroughly incorporated with the soil. Best results have been obtained by applying the sulphur immediately after harrowing and before planting at the rate of 250 pounds per acre with an ordinary grain drill.

Despite the extremely unfavorable climatic conditions attending this spring's potato crop these demonstration plots brought home to the growers first, the necessity for using a leguminous cover crop in a crop rotation; second, the striking difference in growth and suspectibility to disease between the home grown seed and Temecula seed under this year's growing conditions, and third, the value of using sulphur for checking scab.

In the Forum

After the crowds returned from the fields they assembled for an outdoor talk on "Raising Spuds in Southern California," by E. D. McSweeny of El Monte. Using the farmyard surrounded by machine sheds as a forum and a hay wagon for a rostrum, Mr. McSweeny dwelt briefly on some of the points of value gleaned from the severe school of experience.

"We find that a change of seed is desirable; that any seed grown in one locality continuously will deteriorate. Especially is this true of the San Gabriel Valley. Last year we divided a lot of seed potatoes, planting one-half at home and sending the other half to our Temecula place in Riverside County. The next year we brought some of this latter seed back and planted it in the same field and alongside of that grown on the home place. The Temecula seed yielded 170 sacks to the acre; the home seed but 40 sacks. Similar results were obtained from seed sent to Yucaipa, San Bernardino County, when grown beside the kept-at-home seed for a check. I believe seed will thus deteriorate everywhere. A change is desirable. Even the second year after return the seed is superior to that kept at home.

"Do not overtax your land with two crops of potatoes annually. We have given up this practice. Alternate with a cover crop if possible. Of these we have found Melilotus Indica the best. We sometimes use a cover crop of barley and supplement this with commercial fertilizers. We always dip seed as a precautionary measure and find the corrosive sublimate very satisfactory. In regard to spraying to check blight, we have found fall spraying profitable but not spring spraying. I believe it better to irrigate twice before fall planting, once 12 or 14 days before, very heavily, then plow and irrigate again. This gives you a thoroughly moist soil with moisture uniformly distributed. Let potatoes sprout; then cut and plant. Regarding frost damage: Our Temecula fields were visited by three frosts, ten days apart, which blackened the vines; April 5-15-25. And still we have a fair crop. In closing let me urge you to accept the United States bureau of markets grades so we may sell f. o. b., home station. Let us have fuller cooperation among growers, and by all means join the farm bureau, the hope and mainstay of American agriculture."

Afternoon Session

Delegates and visitors left the Stahl ranch shortly after noon and repaired to the Van Nuys high school where the "repairs" and repast consisted of sandwiches, baked beans, ice cream and cookies, with a finisher of coffee; prepared and served by the domestic science class of the school at "so much per."

At 1:30 T. H. Lambert, chairman of the potato growers department of the Los Angeles County farm bureau, called the meeting to order and introduced Farm Adviser Hodgson, who spoke on the accomplishments of the potato growers department, its plans and purposes. Of practical value to growers, he said that cover crops have been found the best means of fertilizing potato fields, but that experiments with potash fertilizers are to be desired as we yet know little of the value of this element for potatoes in local fields. But cover crops furnish the best and cheapest available nitrogen needed. We need closer seed selection, better seed treatment and curing for the fall crop. The new annual white clover, called "Hubam," is very promising and differs considerably from Melilotus alba.

Next came Fred W. Read, chief of the standardization branch of the California state department of agriculture. Mr. Read has just returned from a trip to Chicago, Washington and Eastern shipping centers and said the state department is now definitely tied up and associated with the workings of the federal marketing bureau. In advocating adoption of government grading he said "field run" was hopelessly indefinite while U. S. grades "A" and "B" are definite and fully understood

(Continued on Page 802.)

Agricultural News Notes of the Pacific Coast

Northern California

The first shipment of ripe apricots left Winters, Yolo County, May 28.

Willows, Glenn County, shipped over 20,000 lambs to Chicago during the month of May.

Several carloads of sheep have been shipped from Byron, Contra Costa County, recently.

Owing to frost damage many orchardists of El Dorado County have planted potatoes.

The Sutter County Peach Growers Association expects to get at least $70 a ton for canning peaches.

Happy Valley farmers have arranged to establish a commission warehouse at Redding, Shasta County.

The 1920 pack of olives in this state was about 137,000 cases of 24 standard quarts, about half the 1919 pack.

Supervisors of Shasta County have called for bids for construction of a road from Redding to Lassen Peak.

The strawberry crop of the Santa Clara Valley is said to be the largest in years, growers receiving $10 and $12 a chest.

Planting of sugar beets in the Santa Clara Valley is estimated at 3,500 acres; Sutter Basin, 2,500; West Sacramento, 1,300.

The California Grape Growers Exchange names opening price of $90 a ton for red, $70 for black and $60 for white wine grapes.

The prune acreage of the state is estimated by the California development board at 140,944½, of which the association has signed 115,318½.

W. H. Walker of Willows, president of the state farm bureau, has returned from six weeks' tour in eastern states in the interests of cooperative marketing.

The Sebastopol Apple Growers Union has taken a lease on the French-American Winery at Healdsburg and will convert it into a modern apple packing house.

At the last session of the home department of the farm center at Galt, Sacramento County, there was demonstration of home evaporation of fruits and vegetables.

The annual picnic of the Napa County farm bureau was held at the Napa state farm near Yountville, June 4. Athletic contest, a wild west show and a war dance by Digger Indians from Lake County were features.

The Sutter County farm bureau is compiling records of canning peach prices for the past 38 years to show just what the growers have made under average conditions. These will be used as a basis for price fixing.

President Ramsey of the California Cattlemen's Association warns wool growers to watch the independents who are now putting forth their best efforts to wreck the young cooperative association. He says that one San Francisco firm is advertising free storage in its warehouses.

According to the California development board: "Prohibition director estimates 1921 plantings of wine grapes as 6,000 for Napa County, 13,000 for Sonoma County, 30,000 for Mendocino, 50,000 between Modesto and Bakersfield, and between Modesto and Red Bluff like acreage."

Central California

Turlock's cantaloupe acreage is estimated at 3,500.

Visalia made its first shipment of peaches on May 13.

Tomato acreage throughout the state is much smaller than last year.

Heavy plantings have been made of Blackeye beans in Stanislaus County.

Hog auction sales will be held at Bakersfield, June 18; McFarland, June 24.

The Giant Forest Road was thrown open to tourist travel on Saturday, May 28.

The Oakdale district of Stanislaus County reports pea fields have suffered from aphis.

Much replanting of cantaloupes was made necessary in Merced County by frost damage.

Honey crop throughout the state is generally large; Salinas Valley reports small crop.

Tulare is planning to hold its fair early in September; Visalia will hold its fair in October.

Big combined harvesters are at work in the Tulare Lake district and hauling will soon begin.

The district about Madera reports 200 to 300 acres planted to casabas, mostly Santa Claus.

Work is progressing on the new packing plant of the Peach and Fig Association at Merced.

Kern County farm bureau meetings: Mountain View, 20; Pond, 22; Inyo-Kern, 23; Rosedale, 24; Shafter, 29; Arvin, July 1.

Fresno chamber of commerce reports sale of a 20 acre vineyard of Thompson Seedless near Kerman at $1,500 an acre.

The Lindsay district of Tulare County reports Navels and Valencias all shipped and the heavy cantaloupe movement beginning.

Farm home department meetings will be held in Kern County: Weed Patch, 21; Kern-Delta, 28; Wasco, 30; Edison-Fairfax, July 1.

The Sorghum Mill Company at Hughson, Stanislaus County, has removed to Modesto, where it will much enlarge capacity of mill.

Kern County cotton gin handled in its first season 3,700 bales of cotton raised in Kern, Tulare, Kings, Fresno, Madera and Merced Counties.

A conference of chamber of commerce secretaries of Fresno County will be held at Fresno soon to outline a plan of community advertising.

Not satisfied with the 1920 census which credited Tulare with 3,539 inhabitants the board of trustees called for a new count which shows 5,249.

Santa Cruz farmers are fighting a pest of sea pigeons which have made their appearance after an absence of four years. Some of them are reported to be paying from $3 to $5 a day and ammunition furnished for shooting the birds.

Formal organization of Porterville Cooperative Poultry Association has been completed. There is a membership of 150 covering the district from Ducor to Strathmore. The association expects to start active operation within 30 days.

Southern California

Santa Paula chamber of commerce is conducting a membership drive to enroll 500.

The governor has signed the bill exempting date palms under ten years old from taxation.

The railroad commission has approved increased water rate at Banning, Riverside County.

Twenty-one thousand acres of cantaloupes are under cultivation in Imperial Valley by Japanese.

Residents of Mirage Valley, San Bernardino County, have built a corral to round up stray range cattle.

Consensus of opinion of Santa Barbara ranchers is that the heavy rains have done more good than harm.

The tenth district of the California Alfalfa Growers Association has been organized in the Imperial Valley.

The summer meeting of the Riverside County chambers of commerce will be held at Idyllwild June 17-19.

Poultry Expert Easson is giving culling demonstrations at farm home department meetings in Imperial County.

Home center meetings in Imperial Valley at Meloland, June 20; Westmoreland, 24; Verde, 28; Lantana, 29.

Local farm bureau meetings in Imperial County: Alamo-Verde, June 22; Central-Highline, 23; Eastside-Sunset, 24.

The seven citrus packing houses at Anaheim have been speeding up the shipping of Valencias to about 200 carloads a week.

Maxwell Farms in the San Fernando Valley, Los Angeles County, has just received a carload of Holsteins from Wisconsin.

Death Valley and the surrounding desert has been sign posted by the auto club. All wells and water holes have been marked.

Much of the hay injured by storms is being baled and the best of it sold for feed; the lower grade for mulching orchards.

Lima bean growers are well pleased over the outlook for this season's crop. The acreage planted is not as large as in former years.

Twenty-five carloads of Coachella Valley onions were shipped from Los Angeles harbor to New York last week on the steamer Texan.

The summer session of the citrus institute will be held at Whittier June 24, followed by the annual fumigation and pest control school, June 25.

Hundreds of tons of rock are being dumped along the Ockerson levee by the Imperial irrigation district to hold back flood waters of the Colorado.

A field trip for potato growers of Orange County was held June 9. Inspector Shear of the state department explained methods of control of potato disease.

San Fernando Valley Fair and Market directors and boosters met around the banquet table last week and entered most heartily into plans for the fair to be held September 13-18.

June meetings of the Los Angeles County farm bureau : Pomona and Covina, 18; Monrovia, 21; Del Sur, 22; Owensmouth, 23; Roosevelt, 23; Tierra Bonita, 24; Burbank, 27; Little Rock, 28

The Coast and General

Linn County, Oregon, will hold its fair October 4-7.

June 13-18, farm week at the Oregon agricultural college.

The Dalles, Oregon, expects to begin marketing apricots July 1.

The Polk County, Oregon, farm bureau is starting a campaign for better sires.

Oregon canneries report no orders for future delivery and the outlook very uncertain.

The peach crop of Georgia is officially estimated by the Georgia Fruit Exchange at 7,840 cars.

Railway passenger rates advanced June 1 20 per cent between all points within the state of Arizona.

Next comes National Candy Week, October 3-8, when confectioners will tell us of the food value of candy.

There is to be a "Gypsy Tour" of Oregon motorcyclists on June 18 and 19. Some 800 cyclists are planning to participate.

The commercial strawberry acreage of the United States for 1921 is estimated at 57,219 as compared with 48,619 last year.

The United States bureau of biological survey is working now in Coconino County, Arizona, demonstrating gopher control methods.

Fire burned over several acres in the Prescott forest reserve in Arizona, doing some damage to young timber and to the forage.

The first Australian fruit for the season reached London the third week in April. The shipment included grapes, pears and apples.

Farmers of Yavapai County, Arizona, have initated a movement for a county agricultural agent. This county has not had a county agent for a year.

Some California canners report making contracts with Oregon strawberry growers at four cents a pound. Berry growers associations in California are holding at about eight cents.

Eighteen states have fomulated plans for pooling the 1921 wool clip, according to C. J. Fawcett, director of the wool marketing department of the American Farm Bureau Federation.

Olive culture is being promoted in South Australia by government support; Italy has removed all restrictions on exportation of olive oil; Spain has authorized exportation of 20,000 tons.

Fruit growers of The Dalles, Oregon, who have had a local association for years, have joined the Oregon Growers Cooperative Association. The association expects to do a quarter of a million dollars business there this season.

The Oregon agricultural college is trying an innovation this year as regards Farmers' Week. Instead of holding a week in December or January, it was held this week when the farms, orchards, barns, etc., could be visited under the best of conditions.

Light rainfalls are reported in the north central section of Arizona, but not sufficient to increase the amount of stock water. Ranges in the Flagstaff and Pinedale districts are said to be fairly good. In most other parts of the state the range is poor and water supply low.

Lime and Liming

By R. R. Snowden

BY liming in agriculture is meant the application of quick lime (caustic), hydrated lime (caustic), or carbonate of lime to the soil. Carbonate of lime or calcium carbonate is chemically the same whether in the form of limestone, shells, marl, sugar house lime, gas house lime or chalk.

Pure quick lime (burned lime or actual lime) contains: calcium 71.43 per cent, or 1,428.60 pounds to the ton. Pure hydrated lime (or slaked lime) contains: lime (calcium oxide) 75.68 per cent, or 1,513.60 pounds in a ton; water 24.32 per cent, or 486.40 pounds in a ton; or calcium 54.05 per cent, or 1,081 pounds in a ton. Pure carbonate of lime (calcium carbonate) contains: calcium 40 per cent, or 800 pounds in a ton; calcium oxide 56 per cent, or 1,120 pounds in a ton, and carbonate dioxide 44 per cent, or 880 pounds in a ton.

To calculate the number of pounds pure lime in a ton of lower grade materials multiply the per cent of actual lime in the sample by 20.

All these forms will neutralize soil acidity, rendering sour soils sweet and fitting them for the growth of most agricultural crops; and there are many acid soils in California and Florida and elsewhere in the United States. This is not surprising since the streams are transferring the lime rapidly from the land to the sea. For instance, Silver Spring in Florida transports 600 tons, and the Colorado River more than 12,000 tons of lime salts daily to the ocean. Is it any wonder that soils are constantly becoming more and more acid where no provision is made to prevent it!

The phosphatic marls may contain sufficient phosphoric acid to materially enhance their value for agricultural use and the latter is in a form readily assimilated by plants.

Calcium is supplied to plants in still other forms, to wit: Acid-or superphosphate, basic (or Thomas) slag, bones, rock phosphate, "soft" phosphate, gypsum and wood ashes. Superphosphate is made by treating rock phosphate or bones with sulphuric acid, but a properly made article contains little or no free acid.

The fertilizing power of lime is so well known that there is an old saying that "a lime country is a rich country."

Hilgard suggested that the persistence of western Europe as a center of civilization is probably due to its being a limestone country and that the presence of ancient civilizations in arid regions is likewise due to the same cause. This condition, so fundamental to the prosperity of agriculture, may be maintained artificially by generous applications of lime in one form or another to the soil.

Many plants are benefited by a liberal lime content in the soil, while others are injured by it, and still others are more or less indifferent to its presence. These last will under some conditions be benefited, while under others, injured by applications of lime.

Calciphile, or Lime-loving, Plants

Vegetables: Asparagus, beans (golden wax, valentine, horticultural pole, bush lime, soybeans), beets, cabbage, cauliflower, Canada pea, cucumbers, eggplant, Kohl-rabi, lentil, lettuce, okra, onion, parsnip, peanut, pepper, pea (common), potatoes (sweet), pumpkin, rhubarb, salsify, spinach, squash (summer and Hubbard), turnip (flat), turnip (Swedish).

Fruits: Cherry, currant (white Dutch), gooseberry, orange, quince, muskmelon, plum (Burbank Japan), raspberry (Cuthbert).

Flowers: Mignonette, nasturtium, pansy, poppy, sweetpea.

Grains: Barley, emmer, oats, wheat.

Grasses: Kentucky bluegrass, meadow oats, meadow soft, timothy, sheeps fescue, awnless brome, Rhode Island bent.

Legumes: Alfalfa, alsike clover, crimson clover, red clover, white clover.

Trees: American elm, American linden, balsam.

Miscellaneous: Sweet alyssum, hemp, dandelion, martynia, peppergrass, saltbush, tobacco.

Indifferent

Buckwheat, carrot, corn, potato (Irish), chicory, redtop grass, rye, serradella, spurry, watermelon.

Calcifuge, or Lime-avoiding, Plants

Apple, American white birch, azalea, blackberry, button weed, chestnut, castor bean, cotton, cranberry, cowpea, flax, gladiolus, gallberries, grapes (Concord), grass (redtop), lupine, peach, pear, phlox (Drummondi), radish, raspberry (black-cap), rhododendron, spruce (Norway), sorrel (common), tomato, velvet bean, zinnia.

Calcium is as positively a plant food element as potassium, phosphorus and nitrogen, and much confusion and loss have been caused by its neglect as such. It is just as necessary to plant development as any other element, and perhaps more so, since the use of the others by plants is decidedly influenced by its presence in the soil. Nor can it be questioned that calcium, or lime, affects the well-being of agricultural plants in more ways than any other of the plant foods. Without lime nitrogen, though abundant and available, cannot be used, and no new plant cells can be produced; therefore as soon as the lime is exhausted plant development ceases.

It is used by most plants in greater quantity than any other element and stores of it are thus soonest depleted and hence it is oftenest deficient in soils.

Soils of granitic or serpentine origin are of necessity poor in lime, the latter having the further defect of being rich in magnesia.

Uses and Action

Lime is used as a base in certain insecticides and fungicides. In Bordeaux mixture it prevents injury to plants by the active element copper. As calcium sulphide it carries the sulphur in a soluble form. This is made by boiling 7 pounds quick lime with 4 pounds sulphur and settling out the calcium sulphate formed at the expense of one-fourth of each of the materials used.

Calcium in all the forms mentioned maintains and stimulates bacterial activities, thus encouraging the beneficial changes wrought by these organisms in the soil. The importance of this function can scarcely be overestimated.

Although lime renders the soil potassium more available to plants, yet in moderate abundance of lime at least some plants take up less potash than they do where lime is deficient, e. g., peach and lemon. Lime then promotes economy of the more costly potash.

Lime increases the efficiency of all the other plant foods, which action is probably due to the fact that it produces a wealth of root hairs on the feeding roots of plants, thus greatly extending the area of their absorbing surfaces and capacity for using these nutrients.

Applied to heavy clay soils lime in any of its forms will loosen them by flocculating the colloidal substances and infinitesimally fine clay particles, forming these into small crumbs, increasing capillarity within the soil mass, and admitting both air and water where neither could function before. But where soils are puddled by alkali and closed to the movements of water and air the only form to use is gypsum, or calcium sulphate, for this at the same time destroys the alkaline character of the alkali and renders more easy the removal of the injurious salts.

Paradoxical as it may seem, while lime opens up a heavy soil it also renders an open sandy soil more closed so that it increases its moisture holding capacity. This action should always be aided by additions of organic matter. A beautiful demonstration of the results of flocculation is seen in the case of the enormous crystal springs of Florida and other limestone regions. The clay substances flocculated by the lime salts in solution are so completely removed from the water by filtration through the soil that a grain of corn is plainly seen through 60 feet of this water.

Magnesium in excess or sometimes even in relative excess of calcium is poisonous to plant life. This condition is found in many southern California soils, as a consequence of which ten years ago great alarm was felt for the citrus orchards here on account of the pronounced deterioration of the older ones. Since then enormous quantities of lime in its several forms have been applied to these soils with the happy result of having arrested the decline and restored the threatened groves to their original thrift. Lime is the recognized antidote to the toxic action of excess of magnesia. A proper chemical analysis is an adequate guide to the need for lime for this purpose in the soil; but the analysis must be made on the carbonated water extract of the soil instead of the strong acid extract erroneously used since a soil may show an abundance of lime in the latter instance, while the carbonate water extract may contain a highly toxic excess of magnesia, and this most nearly represents the soil nutrient solution. This statement has been abundantly confirmed in actual practice by the writer.

Besides increasing the quantity lime improves the quality of fruits in several ways, by increasing their sugar content, enriching the aroma, making more juice and less pulp and rind or skin, and deepening color. It also hastens maturity.

Other things being equal lime to a limited extent increases the endurance of trees against cold. A case is on record where old wall plaster was applied to a part of a young lemon orchard near Santa Barbara, in July preceding the freeze of several years ago. The trees receiving no lime were killed to the ground; those receiving it simply dropped their leaves, while one tree that had a much larger amount of lime entirely escaped injury. As a matter of fact a tree well supplied with lime is more resistant to all adverse conditions, climatic or otherwise.

Lime is known to promote oxidation in the soil, and this is found to be closely related to fertility. By this action toxic bodies of organic origin are destroyed and sometimes even converted into beneficial agents of production, thus rendering the soil a more congenial home for all kinds of agricultural plants.

Lime is a specific for "pops" in peanuts, since these are due to its deficiency in the soil. It also prevents "club root" of cabbage and turnips, and reduces soil rot of sweet potatoes.

What Forms to Use

When vigorous and quick action is desired quicklime, or the hydrated, should be used, remembering that either will destroy the humus and may injure the growing vegetation.

For turning under with green manure use the carbonate or both this and the sulphate.

For correcting acidity use one of the alkaline forms, namely, carbonate, quick, or hydrated lime.

To supply calcium for its physiological action any of its compounds mentioned will do, remembering the restrictions on the use of the caustic forms.

To overcome excess of magnesia use the sulphate preferably, or the carbonate.

For liberating plant foods they are most active in the order following, the sulphate, caustic lime, and the carbonate.

For opening up heavy clay soils the caustic forms, sulphate, and carbonate. For improving sandy soils use the hydrated which later becomes the carbonate.

The best way to apply lime to the soil is to spread it on the land and turn it under about six inches deep, then harrow to mix it with the soil. It should be near the surface but all below the dry mulch, for the plant foods remaining in the latter cannot be used by the growing crop.

Caustic lime (quick and hydrated) has the advantage of greater solubility, and its solution will pass into the soil more quickly than other forms, covering the soil grains and presenting thereafter greater lime surface within the soil.

Lime from shell deposits and beet sugar lime possess a fineness of structure unattainable by mechanical means, which manifestly gives it an added value for agricultural uses.

The carbonate, from whatever source derived, is more efficient in the presence of decaying vegetable matter since by mutual reaction the lime is made more soluble by the acids produced and the formation of black humus is promoted. The presence of black humus is generally a good indidation of a well limed soil though this is not always positive evidence. The writer observed a soil in the state of Washington that was black with humus but was barren because practically all the lime had been lost from it after the formation of the humus, proving the statement that "No chain is stronger than its weakest link."

The secretary of the San Bernardino County farm loan association has been advised by the federal farm loan bank at Berkeley that applications will now be received for loans on Yucaipa Valley farms. The board has heretofore refused application pending investigation of water resources and transportation facilities.

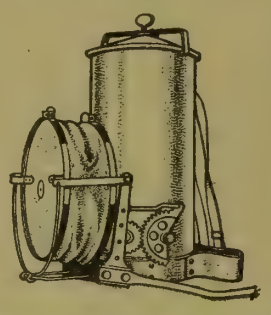
Dusting Vines Truck Crops or Orchards

With The American Beauty Dust Sprayer

Dry dust insecticides for the control of insect pests on vines, truck crops or in the orchard must be applied with such force that the dust penetrates to every part of the infested plant. The underside of leaves and the center of blossom clusters are good breeding places for pests but are seldom treated with the average sprayer.

The American Beauty Dust Sprayer was designed to meet this very need. Its powerful blast forces dry insecticides to all parts of the tree, penetrating the center of every leaf and blossom cluster, thereby giving complete protection. In orchard work one man covers 15 acres a day, with larger acreages in field or vineyard.

Unequalled in the control of Aphis, Thrips, Mildew, Leaf Hopper, Red Spider and other pests. Use "Calispray" dusts made in our own factory for the American Beauty Dust sprayer—brands, ready prepared, for insect or fungus pests.



Through dealers or direct from us.

The California Sprayer Co.

Los Angeles, California

TEAGUE TREES

THE STANDARD FOR QUALITY
They Give Satisfaction Wherever Planted

CITRUS TREES

Grown from selected buds on sour orange root. They are the best that money can buy.

AVOCADOS

All of the recommended varieties budded on hardy Mexican Seedlings.

FEIJOAS

Grafted trees from the best large fruiting varieties.

Send for our descriptive price list and let us figure on your requirements whether it be for one tree or a thousand.

ADDRESS
The R. M. Teague Nurseries
Box A San Dimas, California
Founded in 1889 by R. M. Teague

La Habra Heights

Higher and Adjoining East Whittier and La Habra Districts

3,600 acres pronounced by experts the ideal location for avocado and citrus planting. Protected from frost and wind in combination with good soil. Nearly $250,000 spent on irrigation plant, roads and other improvements. The Hacienda Country Club will soon have their golf course and club house finished in this property.

Ideal conditions for avocado and citrus growing. Fine country club for recreation; beautiful homesites.

Any acreage desired. Low prices. Reasonable terms.

We also specialize in choice Southern California walnut groves.

Developer and Exclusive Agent for North Whittier Heights
727-31 Van Nuys Building Main 2606 Los Angeles

Condition of California Fruit and Nut Crops, June 1

By E. E. Kaufman of the California Cooperative Crop Reporting Service

THE condition of the various fruit crops has changed but little during the past month. Some fruits, like apples and pears, were slow to show the effects of the freeze late in April and now indicate shorter crops than expected. All fruits except citrus suffered damage and are very spotted, making estimates of condition and forecasts of production a very difficult problem.

Apples

The condition of apples is estimated at only 58 per cent of normal as compared to 73 last year and a ten year average of 82. Sonoma reports a light crop of Gravensteins but that late apples will be normal. Watsonville will have no better than half a crop. Yucaipa escaped the frost and, with older and more bearing trees, may double last year's crop. Oak Glen, a small district near Yucaipa, was practically wiped out. A forecast based on present conditions indicates about 4,900,000 boxes for this year's crop.

Apricots

No change is indicated in the condition of apricots the past month, being 45 per cent of normal on June 1 as compared with 55 last year and a ten year average of 70.

Cherries

The promised bumper crop of cherries suffered from both frost and rain, and is estimated at only 63 per cent of a normal as compared with 80 one year ago.

Peaches

The condition of peaches improved two points during May, being now 73 per cent of a normal compared to 87 last year and a ten year average of 81. The improvement was confined to the San Joaquin Valley. The indicated production is for a crop of about 325,000 tons as compared with 345,000 tons last year.

Pears

The condition of pears declined during May; 20 points in Sacramento County and 25 points in Placer County, the two largest producing sections of the state. The state condition is 61 per cent of a normal. Last year it was 70 at this time, with an average condition of 80 for ten years.

Plums

The plum crop is particularly spotted as the frost hit some varieties harder than others. Conditions are about the same as last year, or 70 per cent of a normal.

Prunes

The prune crop was not damaged quite as much as early reports indicated and it is now estimated to be 69 per cent of a normal. Last year the condition was 76 on June 1, and the ten year average is 78.

Olives

June 1 is just about blossom time for the olive crop, and further than to state that there was a good blossom and the setting of fruit depends on weather conditions, but little can be said of this crop.

Oranges

Oranges maintained their promise of one month ago, and the condition is about 92 per cent of a normal as compared with 94 last year and a ten year average of 92. The June drop is still to be reckoned with, so a forecast of production is impossible at this time.

Lemons

A few lemon groves were neglected during the past winter, and correspondents were almost a unit in reporting a condition a little lower than for oranges.

Almonds

The almond crop improved slightly the past month, but is still only 60 per cent of a normal, as compared with 60 last year and a ten year average of 71. Riverside and Stanislaus Counties report a normal crop, with total production probably larger than last year. The crop is spotted and hard to estimate.

Walnuts

Walnuts this year are 77 per cent of normal. Last year the condition on June 1 was 80 and the ten year average is about 87.

Grapes

Detailed reports on grapes are usually not made until July, but owing to the widespread interest in the results of the April frosts, a special inquiry was made of the condition as of June 1. Figures are not available for comparison with the same date for previous years.

Wine grapes apparently suffered the most damage and only 65 per cent of a normal crop is reported for the state, although conditions in the different counties vary from 15 to 100 per cent.

The raisin crop is particularly spotted and hard to estimate. Fresno County, producing 70 per cent of the whole crop, reports a condition of 65. Conditions vary in different parts of the county from ten per cent to almost a full crop. Tulare, the next largest producing county, reports a condition of 90 per cent of a full crop.

The frost was more severe on some varieties of table grapes than others, Malagas apparently being hit hardest. This again brings about a spotted condition that is hard to estimate. Tulare escaped with but slight damage, while Fresno, among the leading table grape counties, suffered most. The condition for the state is placed at 70 per cent of a full crop.

POTATOES: IN FIELD AND FORUM

(Continued from Page 799.)

by the shipping world. "There is no other difference." He also spoke of the universal legal recognition of state inspection and the all-sufficient protection it gives the grower.

D. J. O'Neil of the California Vegetable Growers Association, though not announced on the program, was called upon, as he has just returned from Washington and Chicago, where he has been fighting for lower freight rates. The telegram appearing on our last week's editorial page was drafted by a committee of which Mr. O'Neil was chairman. He said the 1921 celery crop in California had been sold at a loss, also the 1921 cabbage crop and the Coachella Valley onion crop. A few years ago a crate of onions was carried to eastern points for 50 cents; it now costs 90 cents. So now we cannot afford to send them so far east. Therefore sales are restricted in proportion as territory is restricted.

Then followed three speakers on "What the Market Wants—The Necessity of Grading," by F. Reynard, California Vegetable Union; F. J. Beaton, Platt Produce Co.; and F. T. Fogg, American Fruit Growers, Inc. The question with potato buyers is: "what's in the sack?" The label tells, if contents have been officially inspected. The buyer wants to know what to expect. It will not suffice to say: "good grade," or "as good as any going," but what grade is it? Mr. Reynard made a most lucid and forceful illustration of his argument by reading from the guarantees on labels on cans of beans and soup and on a bottle of catsup. "The buyer knows what he is getting."

H. E. Truax of the United States bureau of markets explained the government grades and standards, after which, on motion of E. D. McSweeny, the growers assembled unanimously agreed to adopt said grades and standards. An explanation of the state shipping point inspection service was given by H. H. Warner of the state department of agriculture and the session closed with a ringing speech: "Looking to the Future," by Mark Grimes of Van Nuys.

Montgomery Ward & Co.

RIVERSIDE TIRES

Special Sale Price

$10.45

30x3½

This price good only until July 31st

Guaranteed **6,000** Miles

Shipping Weight, 13 Pounds

Riverside Cords

$17.95

30x3½

This price good only until July 31st

Guaranteed **10,000** Miles

Shipping Weight, 17 Pounds

Sent by parcel post within 150 miles of any of our five houses for 21c postage; within 300 miles for 38c postage; within 600 miles for 71c postage.

RIVERSIDE TIRES are NOT Seconds. They are clean, factory firsts of the highest quality—guaranteed by us to be made as good as tires can be made.

Each tire has our trade-marked name—"Riverside." And the name "Riverside" stamped on a tire is as good as the name "Montgomery Ward & Co." written on a check.

An Absolute Guarantee By Montgomery Ward & Co.

We do not believe there is any firm from whom you buy tires that has an equally old, time-tried Guarantee of "Satisfaction or Your Money Back."

For over forty-nine years, Ward's has sold everything on a Guarantee basis. Millions of customers in that forty-nine years have bought hundreds of millions of dollars' worth of merchandise under that Guarantee.

So, no thinking person can have any doubt, any hesitancy ordering a Ward's Riverside Tire—with the full knowledge that our forty-nine-year-old reputation will be lived up to absolutely.

We guarantee Ward's Riverside Fabric Tires for 6,000 miles. We mean exactly that.

We guarantee Ward's Riverside Cord Tires for 10,000 miles. We mean exactly that.

There can be no risk whatsoever in your ordering a tire from Montgomery Ward & Co. We know that the prices we quote are very low. But the saving we offer is a real saving on the finest grade of clean factory firsts.

Save One-Third on YOUR Tires, TOO!

Read what we say here about prices: "The Plain Truth about these Low Prices"—and then send your order now.

With an absolute guarantee, backed by a house of unquestioned reliability—Why not at least try Ward's Riverside Tires? Why not save one-third on YOUR tires, too!

The Plain Truth about these Low Prices

First let us say that we believe you will ***never again buy tires at such low prices***—unless there is some great discovery of a new way of making tires.

Just consider that before the war, rubber was 60 cents per pound and formerly it was $1.10 per pound. During the war, rubber actually went down to 50 cents per pound.

Last spring the tire business was demoralized. Rubber went to 18 cents per pound. Cotton broke from 40 cents per pound to 12 cents. It is said that 40,000 people moved away from Akron—the great tire making city.

And there, with everything at the low mark, was the opportunity we are always looking for, with cash in hand, to secure a saving for our customers.

With some great change in making tires—some discovery—you may some time in the years to come buy tires cheaper. But otherwise, Ward's prices in this Summer Sale will be the lowest prices at which you ever bought standard, high grade guaranteed factory firsts.

Do You Own a Buick, Packard, Cadillac, or Hudson?

We quote here our great Mid-Summer Sale Price on a 30x3½ tire for Overlands, Fords, Maxwells, Dorts, Chevrolets, etc.

But you who own Buicks, Packards and other cars, write for the book below, our July-August Sale Book. It offers you a saving of one-third on all sizes of Fabric Tires—and on Ward's Riverside Cord Tires—guaranteed for 10,000 Miles.

MONTGOMERY WARD & CO.

Chicago Fort Worth **Portland, Ore.** Kansas City St. Paul

NOW is the time to Buy
Mid-Summer
SALE!
Carefully study these low prices, order now everything you need, and there will be a big cash saving for you
Montgomery Ward & Co.

This Great Sale Book is YOURS—FREE!

Ward's Great July-August Sale Book is ready. It quotes Ward's low prices on all sizes of tires—offering a saving of one-third. On tubes and many other automobile needs the saving is very large.

But there are all kinds of merchandise in this great reduced price sale. Wearing apparel for women, men and children; woolens and silks and cotton goods at startling prices. Everything for the home, for the farm.

We have tried to make this book a complete offering of your Mid-Summer needs—at wonderfully low prices.

One book is Yours—FREE! Fill out now, this coupon, and send it to the one of our five houses that is nearest you.

Western Plant Quarantine Board

THE members of the Western Plant Quarantine Board met in Victoria, B. C., last week and congratulated each other on the accomplishments of the board in encouragement of federal, state and other officials to greater endeavor in detecting and preventing entrance and spread of more insect and fungous pests of farm crops. There was also a look forward to still more efficient work, as is indicated in the opening address of Director Hecke of the California department of agriculture and chairman of the Western Board since its organization. We quote extracts from Mr. Hecke's address:

"Among problems concerning the provisions of plant quarantines maintained within the domain of our common jurisdiction there yet remain several factors that demand our closest attention and most careful study. These should be pursued with persistence until the equation is found for our individual duties to the producer and our united duties toward the general policy of protection. I have faith in the wisdom of the members of this board and a firm belief that continued concentration upon the problem of ways and means of preparing the finished product of the crop as offered for export will eventually meet with success and fill all the requirements demanded by conditions of safety and economy.

"At our last annual conference the subject of vacuum fumigation as practiced by the federal horticultural board at the maritime ports of entry was discussed and much interest manifested in its possibilities. Since that date the California deparment of agriculture has been actively engaged in experimental work with vacuum fumigation, both upon the finished plant products as offered for shipment and with nursery stock.

"The consideration of special problems that have come before the board, such as the further protection of the cotton and lumber industries of the West from the introduction and establishment of especially dangerous pests and the unity of purpose and decision accompanied by prompt action in such matters on the part of the plant quarantine officers, has produced results that may serve as an example of what continuous cooperative effort will accomplish along a given line of work and should be a warrant for further efforts in the same general direction. This same unity of action has also greatly improved the situation in our dealings with the transportation companies and their local agents, and a definite system of procedure enforced at all shipping and delivery points has aroused a widespread interest in the requirements and created a wholesome respect for plant quarantine regulations that is permeating the most intricate of trade channels.

"As a body we have acquired a recognized position in agricultural, commercial and political circles, and in summing the situation up to date I feel that the developments that have accrued, largely as a result of organization, have proven eminently successful and justify in full the conception of the original plan.

"Looking forward and endeavoring to correctly diagnose the requirements of the immediate future from the basis of past experience, several points of interest appear upon our official horizon with distinct prominence. In my opinion the most important at the present time is provision for the making and recording of a thorough and complete survey of the existence and location of crop pests. Accurate information upon this point, even if existent, has not been readily available, and the absence of definite and positive information of this nature from our local and general councils has beyond question caused grave misapprehension and serious consequences in some instances. Such information carefully collected, compiled and recorded in a manner adapted to correction and in a form readily interchangeable with all states concerned, will prove of the greatest value and influence in our future deliberations and conclusions. The necessity of making such a survey appeals to me so urgently that I recommend for your consideration the appointment of a committee to work out the details of a practical plan of procedure during the present conference.

"A second point of interest which in my opinion deserves our immediate attention is the matter of tourist automobiles and automobile camps, several recent occurrences having focused attention upon this question and upon the possibilities of introducing crop pests by means of this mode of traffic. If we are to successfully cope with this menace we must lose no time in devising and executing measures for complete and continuous control of the situation. I am fully aware of the dimensions and complex nature of the problem I am bringing to your attention, as in California there are, in addition to the large number of private automobile camps for the use of which a fee is charged, 157 maintained free of charge by municipalities. In connection with these municipal camps the state board of health has set us an example by promptly taking sanitary measures for the protection of health and has provided means for enforcement of such regulations. Here is a precedent that this board should and must follow in the interest of farm sanitation; otherwise the most thorough and complete system of interception and inspection at the docks and depots will be inadequate.

"Still another point which I consider of vital importance in furthering our general purpose of crop protection through quarantine measures is the need of proper preparation to meet the contingencies arising at legislative sessions. At such sessions we invariably need new or broader statutory authority to keep pace with the new conditions that are constantly arising and, what is just as much to the point, adequate appropriations to enable us to put in execution all the provisions of these same statutes. To secure legislative sanction to such measures and means is often a difficult undertaking unless the plain statements and estimates of the department are supported by representatives of the industry to be protected. In California we have met with remarkable success in the development of this idea through the organization of an agricultural legislative committee.

"This looking toward our future actions has brought me to a subject very dear to the hearts of California's plant quarantine officers, close cooperation with the Federal Horticultural Board. In our work at the maritime ports the greater authority, the broader scope of duty and added prestige that has followed without exception, and the appointment of our plant quarantine officers as collaborators is recognized and appreciated as having strengthened the protective powers of the service more than any other single feature that preceded it.

"Reviewing the work of the board during the past two years a prime accomplishment will be found in our mutual acquaintance, through association, with the immensity of the territory under our collective jurisdiction and a clearer comprehension of the complex nature of the problems sub-

mitted to us for practical control and final solution. In continental North America we find a land surface approximating 1,500,000 square miles, over which we are given jurisdiction in protection to crops, a territory ranging through 33 degrees of north latitude, with all the environmental features that such a situation indicates, with all the meteorological conditions that accompany a change of altitude from sea level to alpine regions, and with a diversity of plant life adapted to all the wide changes of soil and climate from that of desert to subarctic zone; our coast line studded with entries for world commerce and our border lines traversed by continental railway systems embodying all the ramifications of established trade practices. With such a mental picture before us we can but realize that under such conditions the confidence reposed in our ability to maintain a plant quarantine is great, and to successfully do so our belief in the real purpose of the work entrusted to us must be greater. It indeed requires a vision to fully grasp the extent and importance of the work committed to the care and guidance of the plant quarantine officers of the West. To keep this great fertile area clean and sanitary so that the multitudes who are destined to intensively cultivate it in the days to come may produce crops in such abundance as will enable the world to economically feed and clothe itself is indeed a world's work, and in doing our part toward such service we must adhere firmly to the principle of farm sanitation, the only platform upon which plant quarantine may permanently endure."

COUNTY AND STATE FARM BUREAU

The annual traveling conference which has for the past several years been held directly under the auspices of the agricultural extension service of the college of agriculture has had in it a lively interest of the farm bureau membership in the various counties of the state. The California farm bureau federation represents an affiliation of 36 county farm bureaus and represents one of the state units of the American farm bureau federation. The national farm bureau is composed of 41 affiliated states, and represents a total membership in the United States of about two million farmers. The American federation is the most representative farm organization in existence. It might be stated also that the California federation is the most highly organized and largest organization of farmers in California. In this year's program of work a unified project relating to the development of a horticultural department in the various counties is being carried on. There has been created also in the 1921 program of work a poultry department or project which advances the development of poultry husbandry in the state. The sugar beet department has also been started for the purpose of aiding the beet industry in the maintaining of uniform contracts and conserving the interests of the growers.

Perhaps the most important work of the California farm bureau federation at present relates to the development of a state marketing organization and the carrying forward of a campaign for the use of bulk grain and elevator practices in the state. In developing the bulk method of handling grain it has been instrumental in creating the California Farm Bureau Elevator Corporation. This corporation has been capitalized at a million dollars and has as its main purpose the construction of storage and bulk elevator plants all over the state. This corporation has taken over a terminal elevator on the Oakland estuary with a working capacity of 1,200,000 bushels. This terminal plant will be operated as a public utility and will receive grain from farming districts over the state. The corporation also has constructed two field plants for handling of grain in bulk. One of these plants is located at Montpelier and the other at Patterson. The third plant is in process of construction in the upper end of Salinas Valley in Monterey County. The handling of grain in bulk will introduce many economies in the grain business of the state and millions of dollars will be saved to the cereal industry through the elevator processes which we can now say have been successfully established.

Another important development of the California farm bureau federation is the state exchange, or marketing organization which has recently been fully incorporated and started on the way. The exchange will be the great selling organization of the farm bureau. It will be built up by affiliation of the various county farm bureau exchanges and will sell for the farmer vast amounts of the crops not now under cooperative organization.

The utilities department of the farm bureau is giving to the membership an excellent economic service. The legal adviser and manager of this department is Judge Frank S. Brittain. This department is concerning itself with issues arising out of electric power rates and charges and will early be identified with problems connected with public service corporation duties in general.

OREGON GROWERS COOPERATIVE ASSOCIATION NOTES

The Oregon Growers Cooperative Association has advanced its prices on prunes, according to an announcement made by R. C. Paulus, general manager. The association is now getting nine cents a pound for prunes, 40-50 size, packed in 25 pound boxes, f. o. b. the coast, and in some instances a better price. Efforts are now being made by the association to strengthen the price on smaller sizes about one cent a pound. California is pretty well cleaned up on small sized prunes and the association holds most of the 40-50s now in the Northwest.

Although it is a little early to form a definite estimate of the prune crop, reports coming from all prune districts indicate considerable loss, especially in the hill orchards. These blossomed a little later than the lower lands and were caught in the rain and cold weather during blossoming period.

The association will handle a broccoli crop next season from 500 acres or more. Already in the Willamette Valley, in addition to the Salem section, seed has been furnished members of the association who will plant 294 acres. The Roseburg district, whose crop is mostly handled by the association, will probably put in 250 acres of broccoli this season. Seed has been furnished members in the Willamette Valley as follows: Independence, 115 acres; Amity, 36 acres; Newberg, 26 acres; Rickreal, 35 acres; Sheridan, 42 acres, and Chemawa, 20 acres. During the past season the association sold 27,514 crates of broccoli, developing 38 markets through its selling organization.

The English people are still eating Oregon prunes and seem to like them pretty well. During the past week the association shipped more than 100,000 pounds to London. In addition to these last shipments, London had bought 411,250 pounds of Oregon prunes this past winter, and Liverpool 419,050 pounds.

Apple growers of western Oregon are at least looking a prosperous year in the face. According to private advices to the association and also the government's figures, at least 50 per cent of the apple crop east of the Rocky Mountains has been ruined by cold weather. This includes the big apple growing states of Michigan and New York.

CITRUS INSTITUTE PROGRAM

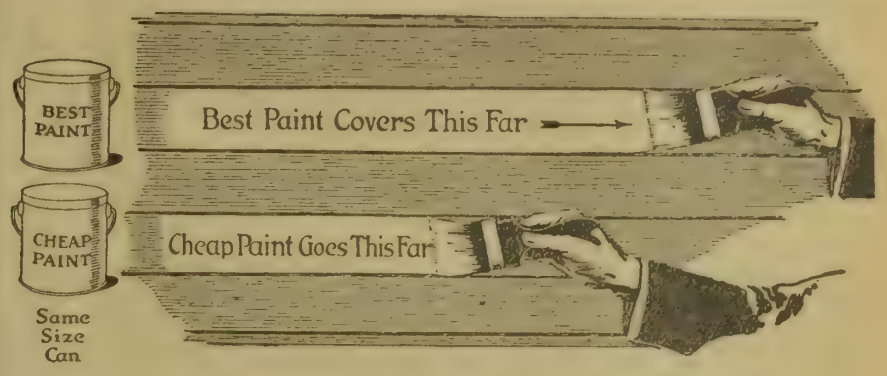
June 24, 1921, High School Auditorium, Whittier.

Morning: Reducing Labor Costs, Geo. B. Hodgkin, California Fruit Growers Exchange; Cost per Acre and per Box, I. G. McBeth, manager Bastanchury Rancho; Possible Economies in Management of Citrus Orchards, Harry Damerel, J. M. Riley Fruit Company, Covina.

Afternoon: Changes in Cost of Production Since 1910, F. O. Wallschlaeger, statistician, California Fruit Growers Exchange; Freight Rates and Their Relation to Fruit Production, C. C. Teague, Limoneira Company, Santa Paula.

6:30: Banquet, Women's Club.

Evening: Agricultural Cooperation, G. Harold Powell, California Fruit Growers Exchange.



Paint Economy

Isn't "Cost Per Gallon"

THERE'S one way only to save on paint. That way is to use the best of paint.

Some think of paint economy as "cost per gallon." That is wrong.

Cheap paint doesn't cover as much surface—you need *more gallons.*

Cheap paint is more difficult to spread, requires more labor, so the best paint costs you no more when you've put it on the house or barn than cheap paint does.

More than that, it lasts five or more years, if properly applied, while cheap paint, on the average, begins cracking in twelve months. Good paint is an *investment* that saves money by preventing deterioration.

"Cheap" paint is the only paint that really *costs.* Don't allow surfaces to rot. It costs less to paint them.

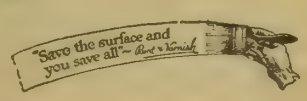
We've made paints for western use for 72 years. We use the best materials—pure *PIONEER WHITE LEAD,* pure linseed oil, zinc and color, but we mix them in scientifically exact proportions with long-time skill.

Our white-lead base must be fine enough to pass through a silk screen with 40,000 meshes to the square inch. That means covering capacity and ease of spread. We superpurify the lead to make it "whiter" which means clearer-toned colors.

Fuller's since 49

The finished product on the house or barn is an elastic, tough protective coating.

We call these paints "Fuller's Specification Farm Paints" because they are the very best made for the purpose.



HOUSE PAINT: Fuller's Pure Prepared Paint, Phoenix Pure Paint, for Painting Houses. The purest, best protective and most durable paint made. Made in 32 colors.

BARN AND ROOF: A protective coating for barns, roofs, fences. Dries with a good gloss and wears. Economical in cost and dependable in quality. Six colors to select from.

FLOOR PAINT: Fuller's Rubber Cement Floor Paint—sanitary, waterproof and durable paint for floors of kitchens, closets, etc. Attractive in color and gloss. Dries hard overnight. Made in 12 colors.

IMPLEMENT PAINT: Fuller's Pacific Wagon Paint adapted for repainting agricultural implements, farm wagons, wind mills. A glossy, durable finish offered in 7 colors.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Floor Finish

I have a floor 20 by 40 feet that was oiled some five or six years ago. Now it's worn and I would like to oil it again and want to know if I should give it a coat of something to fill the pores of the wood before oiling. If so, what quantity of oil would it require to cover such a space? — Subscriber, Los Angeles.

Instead of oil a hard varnish is much to be preferred, and before applying the varnish use any good wood filler which may be had ready for application at any paint store. After the filler is used two coats of hard floor varnish will aid very materially in preserving the floor. There should be an interval of three or four days between applications. Wax may also be applied and, especially if the floor is varnished, the life of the finish may be extended by the use of this floor wax every few weeks. We have asked those qualified to give us some hints on floor preservation, which will be used in a later Cultivator.

Tanning of Rattlesnake Skin

I have a rattlesnake skin that I would like to have made into a belt. Can you tell me how to prepare the skin or where I could get the belt made?—Subscriber, Norwalk.

We will pass this question on to our subscribers. Have any had experience in the matter of tanning or fitting the skins for this purpose?

Pruning of Grapes

Is it best to prune grapes (Thompson Seedless and Muscat) now or wait and prune in the winter?—Subscriber, Terra Bella.

Presuming that your question is whether or not to summer prune Thompson Seedless and Muscat vines with the idea that such summer pruning may take the place of the usual winter pruning, the answer to the question is that summer pruning can never take the place of winter pruning. Summer pruning or topping is sometimes practiced in an effort to promote lateral growth and prevent excessive length growth of the canes which might interfere with cultivation and irrigation or which might be injured by such operations. Judgment must be used in doing this work, since the removal of a large number of leaves has a serious weakening effect on the vines. Generally speaking summer pruning or training should be confined to the pinching of the terminal fans before blooming time. This has practically the same effect as later topping and, in the Muscat variety, tends to promote earlier ripening and a better set of the second crop.—F. K. H.

Blight

A number of inquiries are coming from Sanger and Kerman in Fresno County, and many other sections, describing tomato vines, the leaves of which begin to dry, curl, later yellow slightly and plant dies. Presumably all these cases are of summer blight. There is no treatment possible other than to prevent spread of the dread disease by burning all of the plant as soon as the curling begins. The disease has prevented the roots from gathering moisture from the soil and the plant simply starves to death regardless of the water which may be at the roots. Greatest care should be used in securing seed and in planting in disease free soil. Soil where diseased plants have been should be planted to other crops for several years.

Barren Lemon Tree

We have a 15 year old lemon tree which seems perfectly healthy but never blooms. What can be done to make it produce fruit? — Subscriber, Mountain View.

Apparently this is the fault of the tree in that it seems to be entirely barren. Presumably the only correction would be to rebud, setting in the branches buds from a tree of known bearing ability. Unfortunately this calls for some little knowledge of the science of budding. It is now rather late for the spring budding but if someone could be secured to set the buds, say in October, they might remain dormant during the cooler portion of the season and start early in the spring. Again, it is barely possible the barrenness comes from severe frosts preventing buds from setting. But as the lemon is usually rather persistent in blooming and setting fruit, if of prolific variety, we presume the weather has nothing to do with this, so that in all probability the only salvage for the tree as a fruit bearing tree is in budding.

Bean Rhizoctonia—Aphis

Am sending leaves of hollyhock and small bean plants. The hollyhock leaf if infested with some insect and the beans turn brown on the stem and soon die. What is trouble and cure?—Subscriber, Lancaster.

The hollyhock leaves are infested with aphis which may be handled by a spray of nicotine sulphate purchased at any seed store and diluted according to directions on the container. The trouble with the beans is more serious for, so far as possible with the specimens sent, Prof. H. S. Fawcett of the citrus experiment station at Riverside has identified the trouble as that caused by rhizoctonia, for which there is no satisfactory treatment. However, thorough sanitation, good drainage of the soil and distribution of sand, charcoal, cinders or anything which will prevent spread of fungus is helpful as is also cultivation or aerating of the soil. The only spray which is helpful is Bordeaux mixture and the beneficial results hardly justify its use.

Eucalyptus Stumps

Can you tell me a sure way to kill eucalyptus stumps? — Subscriber, Wasco.

The best, the cheapest and the

Making the Dynamometer Test

Nebraska has a law that requires a dynamometer test to be made both as to the power delivered at the drawbar and at the belt before machines can be sold in that state. If the machine does not measure up to its advertised horsepower the dealer then is required to reduce the advertised horsepower to a basis safely under what the test show.

Recently on the ranch of C. C. Chapman, Fullerton, a dynamometer test was made of the Tioga tractor to ascertain the exact power required in the handling of various implements and at the same time to ascertain the steadiness of power. The dynamometer test was made by F. D. Fouch of the Tractometer Company, using a three section spring tooth harrow and a Tioga tractor. California soil conditions being so varied, it is a good plan for a tractor owner to have his machine equipped with a dynamometer so that he may know at all times just what his load is so that he will not overload the tractor, which is one of the greatest difficulties that the tractor manufacturers have to contend with today.

simplest way of eradicating these stumps is simply by making regular visits every few weeks and removing all of the growth. No eucalyptus stump on earth can live long unless it is allowed to keep its new leaves. Of course it is some time before it will die and dry sufficiently to burn. The quickest way, of course, is to grub out. Other methods we have often referred to are: Cleaning dirt away down to larger roots, piling dry brush around and burning. One subscriber has written in that it may be accomplished by pouring boiling water around the trunk. Boring holes in top of stump, filling with saltpeter, kerosene, or other inflammable material is claimed to be helpful but not always dependable.

Walnut Wood in Organ

I have a solid black walnut organ which I would like to sell and would like to know what the wood only is worth. I know that as a musical instrument it has no value but think the wood must be worth something as black walnut is in great demand. The organ is in good shape, is not scratched or marred in any way, back is six feet high, has some carving on it and has been in the family over 25 years. —Subscriber, Big Pine.

We fear that the walnut lumber in the organ would be in such small pieces that it would have little value for use in cabinet making. We feel sure that it would not justify shipment to the city.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Foreclosure

After a mortgage is due how much time is given the mortgagor to make payment before foreclosure? — Subscriber, Kerman.

Immediately on the day following the date of the maturity of the mortgage the mortgagee is entitled to commence foreclosure proceedings if the mortgage is not paid. The mortgagor is presumed to have his money ready and pay it over on the date of the maturity of the note.

Homestead—Joint Tenancy

In purchasing property I desire to have the deeds so made that in case of the death of myself or wife, the entire title to the property would immediately go to the survivor. There are no children. How can this be done?—Subscriber, Vacaville.

The title can be arranged in two ways to accomplish the desired result. Either deed can be made to the husband and wife as joint tenants with the right of survivorship, or it may be made in the name of either one and a joint declaration of homestead recorded.

Wandering Goats

A neighbor turns his goats loose and they come on my grounds. I have no fence. What can be done? — Subscriber, Inglewood.

The general state estray act provides for the taking up of any estray domestic animal and delivery to constable for sale after advertisement and notice to the owner, as has been frequently detailed heretofore. Under the general law it would probably be the only remedy in cases where there are no fences surrounding property. It is, however, probable that in individual cities and towns there are ordinances governing the wandering of goats.

The Tulare County farm bureau has now operating nine boys' clubs.

Has the "Drouth" Crippled Your Water Supply?

The lack of rainfall in the valleys and snow in the mountains is causing the water plane in all localities to lower. In some instances the water has dropped to a point where it is impossible to reach it without lowering the present pumping equipment. If you are using a LAYNE & BOWLER PUMP we can furnish you with an extension to go on your present pump column, thereby lowering the bowls of the pump to a point where your water supply will be increased.

If you are using the open pit type of pump and the water is below suction limit of your pump — install a LAYNE & BOWLER PUMP directly into the well casing—increase the flow of water—get a bigger crop—and the extra profit thus obtained will more than pay for the new pump.

Household Department

THE PEDDLER'S CARAVAN

I wish I lived in a caravan,
With a horse to drive, like a peddler-man!
Where he comes from nobody knows,
Or where he goes to, but on he goes!

His caravan has windows two,
And a chimney of tin that the smoke comes through;
He has a wife with a baby brown,
And they go a-riding from town to town.

Chairs to mend, and delf to sell,
He clashes the basins like a bell;
Tea-trays, baskets ranged in order,
Plates, with alphabets round the border.

The roads are brown, and the sea is green,
But his house is like a bathing machine;
The world is round, and he can ride,
Rumble and splash, to the other side.

With the peddler-man I should like to roam,
And write a book when I come home;
All the people would read my book,
Just like the travels of Captain Cook!
—William Brightly Rands.

HINTS FROM HOUSEKEEPERS

Muffins—Cookies

Mystery Muffins.—Stir together 1½ cups sour milk and 2 cups rolled oats. Let stand over night. Add 1/3 cup sugar, ¼ cup melted butter, 1 beaten egg; mix well then add 1 cup flour, 1 teaspoon each of salt and soda sifted together. Pour into hot greased muffin pans and bake in hot oven.

Cornmeal Muffins.—Cream together 3 tablespoons sugar, 2 of Crisco or other shortening, add 2 beaten eggs, 1 cup sour milk, sift together 1 cup cornmeal, 1 cup flour, 1 teaspoon each of salt and baking powder and ½ teaspoon soda, add to mixture, pour into hot greased muffin pans and bake in hot oven.

Fig Cookies.—Boil together 1 cup chopped figs, ¼ cup sugar, ½ cup water, a small piece of butter, 1 teaspoon flour, a little lemon juice; let it cool; cream together 1 cup sugar, ½ cup shortening, add 1 egg, ½ cup milk, 1 teaspoon vanilla, sift together about 3 1/3 cups flour, ½ teaspoon salt, 1 teaspoon each of soda and baking powder; add to creamed mixture; divide in two, roll thin, spread fig mixture on one, cover with the other, press gently, cut in shapes desired and bake on greased tins in moderate oven.—Mrs. R. E. Issolt, San Jose.

For "Subscriber," Oakdale

I find ¼ teaspoon soda will neutralize the acidity in one cup of sour milk, therefore in any recipe of which sweet milk forms a part, sour milk may be used if one simply remembers to allow ¼ of a teaspoon of soda for each cup of sour milk and one teaspoon of baking powder to one or two cups of flour for additional lightness. Always, however, sift both baking powder and soda with the flour and then proceed as though the recipe had been left unchanged.

Bacon muffins make a tempting breakfast dish. The bacon is cut in dice and fried, then added to the batter in which may be substituted the bacon fat for the usual amount of butter.

Popcorn Muffins.—Sift 4 teaspoons baking powder, 1 teaspoon salt and a tablespoon sugar with 1½ cups white flour; add ¾ cup fine ground popcorn, 2 tablespoons butter and 1 cup milk with 1 egg. Bake in well greased gem pans about 25 minutes.

Fig Cookies.—Two and one-half cups flour, 2½ cups rolled oats, 1 cup each butter and brown sugar, ½ cup sour milk and 1 teaspoon soda. Flour the board generously, roll thin and cut with a narrow oblong cutter. Mix ½ pound figs chopped fine, 1 cup sugar and 1 cup water and boil till smooth and thick, then add a teaspoon of vanilla, or chop fine ½ pound figs, add ¼ cup of grape juice and 2 tablespoons sugar and let boil to a paste. (I either boil the figs in water till tender or soak in water before adding the sugar.) Put a layer of fig paste between every two of the cookie dough, sandwich fashion, and bake in hot oven. When cold pack edgewise in a jar and hide the jar.

Simple Dessert—Salad

I find a little dessert of evaporated apricots the nicest thing one can make when other supplies are exhausted. Take ten cents worth of apricots, wash very thoroughly, soak all night. In the morning simmer about one hour in very little water. Add small cup sugar, spread out in your cobbler pan, dust with cinnamon and add a lump of butter. Cover with a good pie crust and bake brown. I think the evaporated fruit better than the fresh for this, and it takes so little sugar.

An Appetizing Salad.—For a warm day a salad of crisp white lettuce leaves, sliced bananas and English walnuts, cut in small pieces, served with an olive oil mayonnaise dressing, will be found delightful. I always roll out my scraps of piecrust, cover with a layer of grated cheese (the dry bit), then roll again, cut in little strips and bake brown. These go well with salad. I like a very slight sprinkling of cayenne pepper over them when rolling out.—"Aida," Prescott, Arizona.

Filled Cookies—Sugar Cookies

Here is my recipe for filled cookies that we think are as good as those you buy.

Filled Cookies.—One cup sugar, ½ cup shortening, 1 egg, ½ cup milk, 3½ cups flour, 2 teaspoons cream tartar, 1 teaspoon soda, 1 teaspoon vanilla. Mix, roll thin and shape. Put cookies in buttered pans, place a teaspoon of filling on each, not allowing it to spread to edge; place another cookie on top and bake in the usual way.

Filling. — One cup chopped figs, raisins, dates or prunes, 2/3 cup sugar, 2 teaspoons flour, ½ cup water. Cook until thick, stirring carefully as it burns easily.

My very best recipe for sugar cookies that I always keep on hand for the children: Two eggs, 1½ cups sugar, 1 cup thick sour cream, 1 teaspoon soda dissolved in cream, 1 teaspoon baking powder. Mix stiff with flour, roll quite thick, cut and sprinkle with sugar. — Mrs. L. D. Webster, Julian.

Breakfast Muffins

Three cups flour, 4 eggs, 1 tablespoon shortening, 2 tablespoons sugar, 1 teaspoon salt, 1 pint sour milk, 1 even teaspoon soda. Sift flour and salt into a bowl, beat together yolks of eggs with the sugar and melted shortening, dissolve soda in a little lukewarm water, add to sour milk and pour into bowl with other ingredients. Beat all together and then add the well beaten whites of the eggs. Have muffin tins well greased and heated; fill half full with the batter and bake in a quick oven.—Mrs. Lilly M. Robertson, Kerman.

Sour Milk Muffins

I noticed in issue of May 21 that someone asked for sour milk muffin recipe. Following is one which has been used in our family for three generations and to our mind has not yet been improved upon. It comes from the heart of the corn belt of Dixieland and must be followed to the letter to be a success. Every cook knows she must use judgment in the quantity of soda for each cup of sour milk, the quantity depending upon the acidity of the milk, but the usual amount is one-half teaspoon to each cup:

Two cups sour milk, 2½ cups yellow corn meal, scant teaspoon soda, scant teaspoon salt, one egg; (I use two eggs at present prices). Beat egg, add milk, dissolve soda in tablespoon of water, add to milk and mix thoroughly, then add meal to which has been added the salt, beat hard for a few seconds; have muffin tins well greased and smoking hot, pour two-thirds full of the batter and bake in very hot oven till a golden brown, usually 12 to 18 minutes. It takes practice to make these muffins owing to the fact that milk varies in thickness and corn meal varies in absorbent qualities. The batter should be somewhat thicker than the usual pancake batter, but should be thin enough to pour. The main feature upon which success depends is to have the tins and oven very hot.

The Cultivator Patterns

3625. Misses' One Piece Dress.—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size will require 3⅞ yards of 44 inch material. The width of the skirt with plaits drawn out is about 2⅝ yards. Price 10 cents.

3626. Junior's Dress.—Cut in 3 sizes: 12, 14 and 16 years. A 14 year size will require 4⅛ yards of 27 inch material. Price 10 cents.

3634. Ladies' Night Dress — Cut in 4 sizes: small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size will require 4½ yards of 36 inch material. Price 10 cents.

3600. Ladies' Apron and Oven Cloth.—Cut in one size, medium. The apron requires 1⅜ yards and the oven cloth ⅝ yards of 36 inch material Price 10 cents.

3624.—Ladies' Dress.—Cut in 7 sizes: 34, 36, 38, 40, 42 and 46 inches bust measure. A 38 inch size resuires 5⅝ yards of 44 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

3627. Girl's One Piece Dress.—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size requires 3¼ yards of 36 inch material. Price 10 cents.

3622. House or Porch Dress.—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 7 yards of 27 inch material. The width of the skirt at the foot is 2½ yards. Price 10 cents.

3285. A Simple Set of Hat and Apron.—Cut in 5 sizes: 1, 2, 3, 4 and 5 years. A 4 year size will require 2¾ yards of 27 inch material for the apron and 1 yard for the hat. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

If muffins come out too dry and flaky it means the batter was too stiff or the oven not hot enough; if soggy the batter was too thin. I have gone to great length in explaining this recipe because I find so few women who realize the necessity of having everything just right. Their corn bread is a failure and then they blame the corn meal. I believe the lack of popularity of corn meal is largely due to the improper way it is cooked and the failure of mothers to realize the important part it plays in our diet and especially that of a growing child. It is the most "staying" and strengthening of all our cereals and easily digested when properly cooked.

Following is another general favorite with us: Dissolve teaspoon soda in tablespoon lukewarm water and stir it into two cups of sour milk, mix thoroughly and add two cups rolled oats, beat hard for a few seconds and let stand; now take 1½ cups flour, teaspoon salt, 2½ teaspoons baking powder, two heaping teaspoons sugar, sift all together three times, add dry ingredients to milk and oat mixture, mix thoroughly, break into this two eggs and a tablespoon of melted shortening and beat hard for a minute, drop into well greased muffin tins, either hot or cold, bake till a nut brown in either hot or moderate oven. The batter should be a medium drop batter. After you get it all mixed, if too thin, add a sufficient quantity of oats to make it right; if too heavy, a little water or sweet milk. Never add sour milk after you have mixed in the baking powder. We make our favorite pancakes from this recipe by thinning the batter down to the proper consistency. If you should fry the pancakes on a greased griddle leave out the shortening, but if they are baked on a griddle treated with potato or salt the shortening should be put in the batter. I certainly enjoy the household department of our Cultivator and hope my contribution will be of aid to someone. With every good wish for your continued success, I remain.—Subscriber, San Jose.

Oatmeal Gems—Removing Stains

I am sending a recipe for muffins in answer to the request of Subscriber, Oakdale. The oatmeal gems are very nice for breakfast. The instructions for removing stains I use repeatedly in laundering and find very satisfactory. I appreciate the Cultivator much more since you are making the household department so much more interesting. I have used some of your patterns and find them very satisfactory.

Oatmeal Gems.—Two cups rolled oats, 1½ cups sour milk, 3 tablespoons melted buter or other shortening, 1 teaspoon salt, 1 teaspoon soda (level), 1 cup white or graham flour. Soak oatmeal in sour milk over night; add melted butter and other ingredients. Bake in muffin pans.

Some Methods for Removing Stains.—To remove fruit stains, befort wetting in water soak the article in sweet milk for an hour or more. Peach stain which is so hard to remove may be taken out of the most delicate fabric without injuring the coloring any more than water would. To remove rust apply lemon juice and salt and put in the sunshine. After several applications, if the rust does not disappear, lay the article away for a week or more when the rust will all be gone. If grease from the automobile or other machinery gets on clothing rub the spot thoroughly with lard or Crisco before washing and the spot will come out nicely in the regular wash.—An Interested Subscriber, San Fernando.

Muffins—Pressure Cookers

The Cultivator recipe for muffins is very good, but I would like to add a few ideas that I find helpful. When mixing your batter plan to have a cup or more left over as a starter for next morning. Leave it in your pan and thin with a cup or more of milk either sour or sweet. Set in moderately cool place and the next day use this starter in the same recipe, adding enough more milk to make the necessary amount of moisture. Always add a tablespoon or more sugar as it makes the muffins more tempting and makes a kind of yeast of your starter. If scraps of pudding, fruit juice, or cream are left from dinner, just beat it into your muffin starter and have a pleasant variation in the flavor next morning. Keep on hand a package of bran, cornmeal and other wholesome flours your family like and use in the recipes in place of part of the graham. One teaspoon of soda is plenty for one and one-half cups of starter or milk and I did not find baking powder necessary, although it does no harm, I guess. I prefer the old fashioned iron muffin pans and have them quite warm when the dough is put in. The muffins do not stick as they do in pans made of light material.

Also I am very much interested in pressure cookers. I have used one over a year and think they are a truly wonderful help, also labor and time saver. But speaking to neighbors and friends, I find that very few even know what they are, to say nothing of the advantages. Our home department agent of the farm bureau is taking up the use of the pressure cooker for cold pack canning, but it is the use every day, every meal, that I thought perhaps you could help people to find out and learn about. I would be glad to help if I could in any way, but do not feel qualified to write at length on the subject.—Mrs. Robt. Burr, Hanford.

Muffins—Fig Cookies—Hermits

Sour milk 1 teacup, salt 1 teaspoon, shortening 3 tablespoons, flour 2 cups, sugar 1 teaspoon, 1 egg. Mix all together, then dissolve ½ teaspoon soda in 3 tablespoons hot water and put into other ingredients. Stir well and just before putting into hot muffin pans stir into batter 1 teaspoon baking powder.

Fig Cookies.—One cup sugar, 1 cup butter, ½ cup milk, 2 eggs, 2 teaspoons baking powder, flour to roll stiff. Bake in one sheet, or you may cut into four inch squares. Roll out very thin and bake in hot oven.

Fig Filling.—One cup sugar, ¼ cup water boiled to crack stage. Run ½ pound figs through meat chopper and put into syrup while hot and beat till cool. Spread on cookies, put another on top and sprinkle with pulverized sugar.

Hermits.—Three cups sugar, 2 cups butter, 2 cups seedless raisins, 2 cups currants, 1 cup candied citron, 1 cup nut meats, 1 teaspoon soda, 2 teaspoons cinnamon, 2 teaspoons allspice, 1 teaspoon cloves, 1 cup coconut, 6 eggs. Roll thin, bake in moderate oven.—Housekeeper, Riverside.

HOUSEHOLD QUERIES

Covering for Porch Floor

Please tell me of some good floor oil or something to preserve the floor of my back porch and steps. This is a farm house and the men wear off paint too soon.—Subscriber, Burbank.

Here is a problem for our practical housewives. Who has solved it satisfactorily?

As suggestions: Apply two coats of paint, then coat of one of the waterproof, mar-proof varnishes. For a small space good lineoleum, also treated with coat of same durable varnish or shellac. Entire replacement of floor with cement, making necessary, of course, building up solid foundation of earth. This is the most practical floor for porch having heavy wear and would cost no more than linoleum and, of course, be permanent. easily cleaned and in every way satisfactory. If the work is done by home talent the largest expense—for labor—is cut out.

OLIVE RECIPE BOOK

The California Olive Association has just issued a California Ripe Olive recipe book in an edition of a hundred thousand. The recipes have been prepared and tested in the laboratories of the university by Misses Orabel Chilton and Maud D. Evans of the southern branch and articles are included by Professors Jaffa and Bioletti on the food value and history of the ripe olive. Calorific values are worked out for each recipe and a supplementary list of balanced menus add value to the work.

Here are a few of the recipes from the booklet:

Sardine and Olive Canapes

Rub sardines to a paste with a small amount of melted butter. Add a few

JERSEY JUBILEE

The Oregon Jersey Jubilee which just closed its third annual tour was not only well attended but introduced to the members of the party from abroad one of the most unique dairy sections of the world. Using the farm of Frank E. Lynn of Perrydale as point of assemblage, the train of autos with close to 300 Jersey boosters wound its way up over the Coast range of mountains and down into the famous Tillamook Valley.

Judging from the character of its Jersey cattle additional fame is yet to come to this little dairyman's paradise nestled down amongst the high hills clad with green forests and tempered with the moisture laden breezes from the sea. With a limited acreage of bottom lands cleared from heavy spruce timber, this little section with its thousand dollar an acre land that supports a cow per acre the year around, last year produced over six and a half million pounds of cheese that sold for $2,000,000 and yielded the producers an average of nearly 72 cents per pound for their butterfat. Is it any wonder that prosperity is apparent on every hand? Why should these Jersey enthusiasts worry about the future with herds yielding up to an average around 400 pounds of fat per year with grass 12 months of the year?

It is an inspiration to gaze on these pastures filled with beautiful cows in the very pink of condition and to realize that the progressive spirit evidenced throughout the tour means still greater improvement in breeding and production and in net returns. From three herds with pure bred Jersey females in 1914, the breed has increased in popularity until now there are over 80 pure bred herds and 207 pure bred Jersey bulls in service.

Two days were spent by the visitors inspecting cheese factories and the various pure bred herds. Speech-making, feasting and a general good time made the stay both a pleasant and profitable one which closed with a clam bake on the beach at Netarts on the bay.

The Jubilee has come to stay. It is surely a factor in breed promotion in Oregon and might well be tried by some of the breed associations in California.—Chas. N. Talmadge.

A COMPETENCE WITH LIVESTOCK

(Continued from Page 798.)

won't make a million, but if he starts right, works hard and sticks with it and uses his head for purposes other than to keep his collar from slipping off, he will be rewarded with a good living, fine friends, the knowledge that he has contributed something to the betterment of the world, and a competence for his late years.

"Going back over my past experience, I can't recall one single man who has stayed with good cattle for ten years who has lost his business. I can recall a considerable number who have lost out because they expected too much too quick.

"The chances are that if we had kept sold down pretty close when we first started. we might never have learned that the profits in livestock must come from accumulation of produce and that it takes time to get that accumulation.

"After we learned that fact we managed to go ahead. We learned to feed and to breed. The more interested we became the more we studied the business. During the past ten or twelve years we have sold a good many thousand dollars worth of cattle. We have passed from renters to land owners and our cattle have paid the bills. We have never had our cattle fail us if we gave them the care and management due them, and the longer we stay in the business the greater the possibilities seem—but it takes work, don't forget that."

The above advice and observations can be commended to the serious attention of any man considering engaging in the production of any class of livestock. The man quoted is really one of the most successful breeders of the West, and the writer happens to know that only modesty kept him from telling more of his success. There are other men, many men, in this state who could tell almost the same story. Nearly every community lays claim to one or more successful livestock men, but in each case, so far as the writer knows, these men have succeeded because they stayed with the business. Very, very few men have made quick turnovers and quit ahead of their start.

Last fall there was a complete dispersal sale of one of the large pure bred dairy herds in Southern California. One hundred and thirty-seven head sold for a total of $73,000. But the sale report failed to tell the whole story. Six or seven years before that herd was started on a modest foundation. Gradually more cattle were added until the total investment in cattle was about $23,000. During the life of the herd, and prior to its dispersal, around $46,000 worth of cattle were sold. In short, nearly $120,000 worth of cattle were sold from a $23,000 investment. Rather good returns, the reader will agree, but only possible through the accumulation of produce and the fact that the owner stayed with the business.

I know another breeder who maintained a small herd of pure breds. Gradually a small farm was paid for out of the milk checks. The family was returned a good living and the children educated, but they worked hard and the owner always declared that he was losing money. Finally he sold his herd and the sale totaled $30,000. That man was better off than the average. How many men do you know who own a farm and have $30,000 in cash?

Nearly every successful breeder has started modestly and stayed with the game. I know of a breeder in an Eastern state who engaged in the cattle business something over ten years ago. His start was most conservative, but in ten years he has sold more than $100,000 worth of catle and has a herd of 90 on his farm. Not all the $100,000 came from the offspring of the original purchase, but the major portion is credited to it.

year, was made by a man who started 15 years ago with an 80 acre farm. And so it goes. Many similar stories can be called to mind—but the point for all is this: The livestock business abounds with opportunities for the man who is willing to work hard, think clear and wait for the herd or flock to increase. And, as the breeder quoted above said, "It doesn't make so much difference where one starts—it's the finish that counts." Where will you finish, young man or young breeder, with the group below the average, among the average, or above the average? It is largely up to you.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

June 29, Gotshall & Magruder, Ripon.

The Innisfail herd of milking Shorthorns at Davis is going ahead in great shape. Under the direction of Johnny Rowe a number of fine production records have been made and the herd now holds all of the coast records excepting in the junior two year old and aged cow classes. The records for the two three year old classes are also the highest in the country. Along with its high production the Innisfail herd excels in individuality, and in the shows at Sacramento and Portland last year it carried off the lion's share. Two fine bulls have been sold out of the herd in the past week. Imp. Kelmscott Viscount 19th, a bull who has been in service in the herd for some time, went to E. H. Day of Gazelle and Innisfail Trickster, a yearling sired by Imp. Kelmscott Viscount 19th and out of Greenhill Caroline, the junior three year old champion of the U. S., with 429 pounds of fat, went to Dr. Tevis of Alma. The Rowes will have a strong herd in the shows again this year.

Guy H. Miller of Modesto is celebrating his twenty-fifth year as a breeder of Jerseys. He began his work on his little farm at Riverside and soon transferred to larger fields at Modesto, Stanislaus County. Mr. Miller appreciated the great beauty of the Jersey, more its utility and efficiency, and bred to an ideal which has made "Venadera" type known the state and nation over.

William Ward of Easton & Ward, owners of the Blackhawk Ranch, Diablo, is now in the East in company with Manager E. Lovell for the purpose of attending a number of prominent Shorthorn sales to select a few choice females to add to the Blackhawk collection.

After what was declared to have been one of the most bitter factional fights in the history of the Holstein-Friesian Association of America, ex-Governor Frank O. Lowden of Illinois was elected president of that association to succeed D. D. Aitken of Flint, Michigan, who has held the office of president for several years. The election occurred at the annual meeting of the association which just closed at Syracuse, New York.

A. B. Humphrey of Escalon is going to sell a choice lot of bred Berkshire gilts and young sows at his Grapewild Farm on June 30. These young things are strong in the blood of Grand Leader 2nd, the grand champion of the P. P. I. E. in 1915, who was developed and shown by this farm. Many of them are also by Wilsonia King Laurel, son of Laurel Champion and littermate to Real Type, the great Barker herd boar. A large number are bred to Escalon Big Joe, who was grand champion in all the big California shows last year. The pigs from these matings will carry a large per cent of the blood of Grand Leader 2nd and Laurel Champion. L. E. Frost of Chicago will be in charge of the sale and Col. John A. Davis of Manteca will be the auctioneer.

Geo. E. Platt of the Los Angeles Creamery Company has just purchased six Ayrshire bulls from the Elkhorn Ranch at Watsonville. The calves were sired by Imp. Holehouse Secretary and Penshurst Statesman, the young bull which is getting excellent calves for the place. All of these calves are out of Advanced Register cows, one being from Rena Ross III who has record of 16,683 pounds milk and 684 pounds fat in 365 days.

The American Hereford Cattle Breeders' Association is the first cattle association to have recorded 1,000,000 animals. That number was reached in May. There was such a wide demand among the breeders for the privilege of recording under that number that the association sold the right at auction as well as the right for the number 999,999 and 1,000,001.

DISPERSAL SALE

100---REGISTERED HOLSTEINS---100

Gotshall & Magruder Herd, Ripon, Cal.

Wednesday, June 29, 1921

The offering will include the dispersal of the Gotshall & Magruder herd of 91 head, and 9 females from the select small herd of W. A. Walker, Ripon.

The sale will include some of the most highly bred females offered this season, and the list is altogether one of excellent cattle. Among the females are

A BEAUTIFUL 25 POUND 4 YEAR OLD with 753.1 lbs. butter in one year as a 3 year old, and her daughter by a 32 lb. son of King Mead of Riverside.

A 21 POUND 3 YEAR OLD DAUGHTER of King Segis De Kol Korndyke, with 646 lbs. butter in one year as a 2 year old, her dam a 28 lb. daughter of King Walker Segis.

A 17 POUND JUNIOR 2 YEAR OLD daughter of Sir Aaggie De Kol Acme, out of a 26 lb. 3 year old whose dam is by a 33 lb. grandson of Hengerveld De Kol.

A DAUGHTER OF KING MEAD OF RIVERSIDE due to drop her first calf on June 27th.

A DAUGHTER OF THE 37 POUND COW BOWEDA, sired by a 1,000 lb. son of Segis Pontiac De Kol Burke.

AN 18 POUND JUNIOR 2 YEAR OLD daughter of the 35 lb. 4 year old K P Idyl Segis, now well along on yearly test.

A DAUGHTER OF THE 36 POUND COW K P TOLA, sired by It, and now milking with first calf.

A SPLENDID FAMILY consisting of a 25 lb. granddaughter of Colantha Johanna Lad, her three daughters, and two granddaughters. Be sure and look this group over before sale.

SPRING FARM CORNUCOPIA ORMSBY, the dam of Karlray Ormsby Alcartra, the great junior 2 year old that made 916.5 lbs. butter in one year and sold in the last Guaranty sale for $1,850. Two of her daughters are also in this sale.

A 28 POUND COW, out of a 26 lb. dam that milked 610 lbs. in 7 days and made 723 lbs. butter in one year.

A DAUGHTER OF SIR AAGGIE MEAD, the $9,250 son of Sir Aaggie De Kol Acme.

A 26 POUND COW and her daughter by a 32 lb. son of King Mead of Riverside.

A LARGE NUMBER OF OTHERS with official records up to over 25 lbs. butter in 7 days, some with yearly records, others now on yearly test.

EVERY ANIMAL GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

TERMS OF SALE: One-third cash, balance in three equal payments in three, six, and nine months, with approved note bearing eight per cent interest.

PLACE OF SALE: The ranch formerly owned zy C. A. Miller, on the French Camp Road, 6½ miles northwest of Ripon, 13 miles southeast of Stockton.

Catalog of sale free on request.

The Wool Situation

Wyoming is the first state to pass a Truth in Fabrics law. The measure is now in effect, and while it is too early to announce any results it is expected to accomplish its object in compelling clothing dealers to sell their wares for what they are. That is, shoddy must be sold as such and the wool content of garments must be shown to the satisfaction of the buyer. The clothing retailers of Wyoming are said to be favorable to the law. In fact, one of the state's biggest retail clothiers was a member of the legislature and raised no objection to the measure.

Strong efforts are being made to secure the enactment of the French-Capper Truth in Fabric bill now pending in congress. The need for this was brought out recently in a statement by J. B. Wilson of McKinley, Wyoming, secretary of the Wyoming Wool Growers Association, who declared that a tariff on wool was not the only thing necessary in order to afford adequate protection to the wool producers. He said: "Why, I have sold wool for 10½ cents a pound when the tariff was 11 cents a pound, and I have heard of other wool growers who sold for even less. No tariff will protect the wool grower from the secret competition of shoddy—reworked rags. Shoddy must be identified by labeling it so that people will know what they are buying and may choose between shoddy or virgin wool. The French-Capper bill will compel textile manufacturers to label their all wool clothes with its content of virgin wool and of shoddy and will force the venders of shoddy out in the open."

The sheep industry is still in a bad way on account of the immense accumulation of wool. Mr. Wilson pointed out that in Wyoming alone more than half a million sheep have gone to the block since January 1. It will take years to bring the industry back to pre-war conditions even with the aid of legislation. About 75 per cent of the 1920 wool clip is still unsold and the 1921 clip is already under way with very little prospect of a market. It is up to congress to afford whatever relief the wool growers demand. Success of the various wool pools which have enabled farmers to hold and market their wool gradually is the one bright spot in the situation. Cutting out handlers' profits has been of considerable help.—Western Farm Life.

The Bull Association

The cooperative bull association is a companion enterprise of the cow testing association in the sense of both having a common object, that of upbuilding the dairy herd. The organization employing a cow tester is probably a more direct agency for improvement inasmuch as the low producer of the herd is forthwith discarded if production records do not favorably tally with the outgo for feed with a liberal margin to the credit of performance at the milk pail. Joint ownership in a pure bred bull signifies a refining process, frequently slow of development but none the less certain of results. Both organizations are united in their warfare on contagious diseases of cattle and in pledging mutual effort in the profitable marketing of surplus cattle and dairy products.

The idea of placing a pure bred bull of recognized merit at the disposal of a group of farmers unable to acquire sole ownership of one such animal to each individual farm had its inception in Michigan, a state likewise credited with the birth of the cow testing association movement.

The Michigan agricultural college reports: "It would seem highly desirable that some form of cooperation in breeding methods be established by communities, such for instance as the joint ownership and use of males by several parties rather than one. In theory this proposition sounds well, but in practice it has not worked out satisfactorily in the majority of instances, as illustrated by the universally undesirable results from the formation of stock companies in the ownership of stallions. In this instance, however, it is only fair to venture the assertion that the initial troubles among these companies are generally the fault of the organizer or promoter, the seller of males, who unloads something on the company that does not prove satisfactory. One cannot conceive any logical reason why several men in a community could not form a copartnership in the ownership and use of good sires. If such a plan could be followed the good influences of superior sires would become more far reaching and fewer males in all would be needed than in the case of individual ownership."

A cooperative bull association is a farmers organization whose purpose is the joint ownership, use and exchange of three or more high class pure bred bulls. The territory covered by an association is divided into three or more breeding blocks, and a bull is stationed in each block for the service of the 50 or 60 cows in the block. Every two or three years the bulls are interchanged. Therefore, at the initial cost, a bull for every 60 cows is provided for six or more years. The cost of bull service is thus greatly reduced, the very best bulls can be obtained, and the man with limited means and only a few cows is enabled to improve his herd. Bulls of outstanding merit are preserved for their entire period of usefulness. Associations of this kind teach cooperation, encourage careful selection of cows and calves, introduce better methods of feeding and management, intelligently fight infectious diseases of cattle, and assist in the marketing of dairy stock and dairy products.—Farm and Ranch.

EFFICIENT FLY SPRAY

The following recommendations are made by C. L. Blackman of Iowa to cow testing association members in that state:

Flies cause considerable annoyance to dairy cows during the summer and not only does the irritation tend to lower milk production but the restlessness of the cows is a frequent cause of inefficient milking.

A good fly spray can be made from 4½ quarts coal tar dip, 4½ quarts fish oil, 3 quarts coal oil. 3 quarts whale oil, 1½ quarts oil of tar.

Dissolve three pounds laundry soap in water, add the ingredients of the spray and bring the whole up to 30 gallons with lukewarm soft water. This spray will keep off the flies and prevent the coats of the animals from becoming harsh.

The cows should be sprayed twice a day, in the morning after milking, and in the afternoon when in the barn for silage or green feed. With a portable cart, made from a half barrel by attaching wheels and a spray pump and nozzle, two men can spray 40 cows in five minutes.

Thirty gallons of mixture will spray 40 cows twice a day for ten days at a cost of one cent per cow per day.

COST OF PRODUCING MILK

Market milk cost on the average 33.2 cents per gallon, $3.86 per 100 pounds and $213.13 per cow per year on 84 northern Maryland farms surveyed recently by the United States department of agriculture in cooperation with the University of Maryland. A preliminary report of this survey, just issued by the office of farm management and farm economics, shows that, with an average sale price of 34.2 cents per gallon, 48 of the 84 farmers, or 51 per cent, failed to make a profit over the book cost, with all feed and labor charged at full current rates.

The average number of cows on the farms surveyed was 18.2, and the annual production varied from less than 4,000 pounds to over 8,000 pounds, with an average for all cows of 6,074. Practically all of the milk in question was shipped, either to Washington or Baltimore.

The Willows Ranch
Home of Big Type Poland China Hogs. This Herd Noted for Size and Quality. Correspondence Invited
A. J. ELLIOTT, Proprietor
Box 45, Route 1, Tulare, Cal.

Of the total cost of production about one-half ($121.38 per cow) was for feed, 56.6 per cent of this being farm grown. Grain fed totalled 2,259 pounds per cow per year, 512 pounds of this being grown on the farm. Hay fed totalled 1,793 pounds, practically all home grown. Man labor per cow totalled 291 hours, horse labor 29 hours.

These figures for feed and labor expenditures, in pounds and hours, are considered of greater importance than the costs as expressed in dollars and cents, since the former do not fluctuate greatly from year to year, and may be taken as basic in estimating the cost of milk production in the region surveyed.

A farm business analysis, made in connection with the cost studies, brings out in a striking way the relation between cost of milk production and farm income. It was found that the labor incomes of 15 farms with comparatively low milk costs averaged $1,448 higher than those of 15 farms with comparatively high costs.

GOATS IN THE WEST

Bulletin No. 749 of the United States department of agriculture, entitled, "Goat Breeding in the Pastures of the West," says:

The most economical and satisfactory results are obtained with flocks of about 1,200 goats; it is best to graze separately goats in milk, dry goats, bucks, yearlings and weaned kids. Goats should be put out to graze for four or five hours in the cool of the morning and for a similar time in the evening; they should rest during the heat of the day. The bed grounds should be changed several times a year; it would be still better to graze the goats for short distances and to bed them at night where they happened to be in the evening. This allows of the grazing of a larger number and increases the production of goats, hair and meat while improving the pasture.

The author recommends the Angora as the breed best suited to the western states of America where goats are kept chiefly for their hair and meat, and secondarily for milk and their skins. Young goats under 18 months of age are not yet suitable for breeding. One buck kept with the does at night and fed with a little grain as a supplementary ration will serve 50 or more does. In 1915 and 1916, for different flocks of Angora goats kept on open grazing grounds in New Mexico, the cost per annum of yearlings was from 95 cents to over $2 a head, exclusive of interest on the capital and the owner's labor; the average annual revenue for two year olds was about $2 a head; that for yearlings was slightly higher; the annual cost of pasturage of does and their kids varied from $1.62 to $2.78 per doe, and the average annual revenue per doe from $3 to over $5.50.

NEW LOW RECORD FOR FARM ANIMAL MORTALITY

Nearly 7,000,000 domestic animals were lost from disease and exposure on the farms of the United States during the year ending with April, 1921, as the bureau of crop estimates, United States department of agriculture, has recently estimated, and their value was about $150,000,000. These losses comprise about 369,000 horses and mules, 585,000 lambs, 1,223,000 mature sheep, 1,743,000 cattle, and 2,946,000 swine.

While these numbers are large from any point of view, yet they represent low rates of mortality. The rate for horses and mules, 1.47 per cent, has been exceeded for many years, and the same statement applies to 1.70 per cent loss of cattle from disease and 0.93 per cent from exposure, to 1.48 per cent loss of sheep from exposure, to 4.62 per cent loss of lambs from disease and exposure, and to 4.42 per cent loss of swine from disease, in this case with the exception of two recent lower years. Sheep diseases were fatal about as usual. A mild winter was favorable to the making of this low record of mortality. It is also true that animal mortality from diseases is declining as the various public agencies, veterinarians and farmers better understand how to combat them.

SIR AAGGIE DE KOL MEAD

His Sire: SIR AAGGIE DE KOL ACME, son of the world's official yearly butter record holder, Aaggie Acme of Riverside 2nd, 1,331.66 lbs. butter in one year, and she the dam of Miss Aaggie Acme Burke, 1,034.66 lbs. butter from 24,338.9 lbs. milk in one year as a junior 2 year old, world's milk record in class in 1920. He has over 100 living daughters, the first sire in California to have that distinction.

His Dam: MISS VALLEY MEAD DE KOL WALKER, 1,113.57 lbs. butter from 22,021.1 lbs. milk in 342 days as a junior 3 year old. She has three sons in active service, one of which, and a half interest in the other two, have commanded the highest prices ever recorded for bulls of any breed in the west.

THE RECORDS BEHIND SIR AAGGIE DE KOL MEAD:

Five of His Seven Nearest Dams Average:

Butter	2 Years	2,040.97 Pounds
Milk	2 Years	41,547.20 Pounds
Butter	1 Year	1,130.66 Pounds
Milk	1 Year	23,096.60 Pounds

His Seven Nearest Dams Average:

Butter	7 Days	30.47 Pounds
Milk	7 Days	627.60 Pounds

Keep your eye on this great young sire of the Aaggie Acme-De Kol of Valley Mead breeding. His first calves measure up fully to the promise of his pedigree, and you may need one of his young sons to round out your herd one of these days.

Owned Jointly by
Fred Hartsook Lankershim, Cal. and A. W. Morris & Sons Corp. Woodland, Cal.

While the children should be encouraged to study art, they need not feel it necessary to decorate the new wall paper with pencil sketches.—Pajaronian.

OLIVE RECIPE BOOK

(Continued from Page 809.)

drops of onion juice. Spread this on rounds of bread toasted on one side. Cover with a thin slice of tomato dipped in French dressing. Cover the tomato with a layer of chopped egg and minced olives, well seasoned.

Cheese and Olive Canapes

Cut stale bread in one-fourth inch slices. Divide slices in halves and toast on one side. Cream six tablespoons grated American cheese with one tablespoon butter. Season with salt and cayenne. Spread on toasted side of bread and garnish with a one-fourth inch border of finely minced olives. Outline inner side of border with strips of pimiento.

These may be served in place of sandwiches.

Oyster Cocktail

Two dozen small oysters, or 1 pint cut in pieces, ¼ cup minched ripe olives.

Chill oysters and olives and put into small glasses, lemon or pepper shells or tomato cups. Pour over the following sauce and serve ice cold.

Sauce.—1 tablespoon horseradish, ½ teaspoon Tobasco sauce, 1 tablespoon vinegar, 1 tablespoon Worcestershire sauce, 2 tablespoons lemon juice, 1 tablespoon tomato catsup, ½ teaspoon salt. Mix together thoroughly. Sufficient for ten servings.

Lobster or Crab Cocktail

One cup crab or lobster meat, ¼ cup finely cut celery, ¼ cup minced ripe olives, 3 tablespoons tomato catsup, 1 tablespoon vinegar, 2 tablespoons lemon juice, ¼ teaspoon Tobasco sauce, ½ teaspoon chives, chopped. Salt to taste. Sprinkling cayenne.

Cut crab or lobster meat in small pieces and mix with celery and olives. Mix remaining ingredients together and add to first mixture. Chill and serve in cocktail glasses.

ALMOND HULLER

AND

English Walnut Cracker

Mr. Grower, I have a machine for your 5-10-40 acre almond orchard cheaper than a Ford.

CAN YOU BEAT IT?

It hulls the nuts by rubbing. Under complete control of levers set at the proper place to suit any size nuts or conditions. Can be changed instantly.

Do you see the Ford idea?

SIMPLICITY!

The two surfaces come just close enough to work on unhulled nuts. The hulled almonds glide along without being touched. The meats fall through the screens quickly. They are not broken or nicked. Off price on account of damaged meats practically eliminated.

FEEDS AUTOMATICALLY and does not require a man at the hopper to keep it clear. Does not get out of repair. Any man can run. Requires only 1½ to 2½ H. P.

Write for circulars giving full information.

L. K. VAUGHAN

Pat. and Mfr.

172 Elm St. Woodland, Cal.

BURR AND AGEE HOLSTEIN SALE

The Burr Farm-Agee Bros. combination sale of Holsteins held at Burr Farm, Los Angeles, June 9, served to distribute a desirable lot of females at prices that must be considered conservative in view of the class of cattle offered. The sale was distinguished by the fact that nearly all the offering was taken by men either making their first pure bred purchases or recently engaged in the business.

The top of the sale was $575, which was paid by J. F. Grueb of Huntington Beach for the six year old Carnation Rag Apple De Kol from the Burr Farm consignment. C. M. De Vore of Coachella secured Pleasant View Freckles, a 20 pound cow, also from the Burr Farm herd, for $500.

Thirty-two females offered by Burr Farm made a general average of near $300.

Agee Bros. had a top of $450, which was paid by J. D. Hoffman of Pasadena for the 20 pound Maid Mutual Beatrice De Kol. Beauty Fobes Pontiac Korndyke followed closely at $425, going to the same buyer.

The 18 head from Agee Bros. herd averaged $237.

The sale was managed by C. L. Hughes of the California Breeders Sales and Pedigree Company. Rhoades and Rhoades were the auctioneers.

A representative list of sales follows:

Burr Farm Consignment

1, Amelia Bona De Kol 2d, Mar. 1915, 6 yrs., 26.15 lbs.; San Bernardino County, $485.

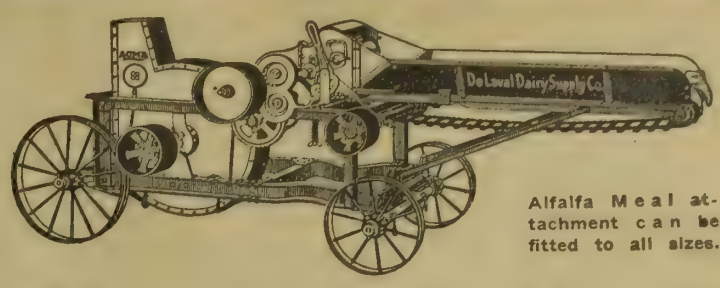
The ACME Cutter

Combined Silo Filler, Hay Chopper and Alfalfa Meal Machine



Alfalfa Meal attachment can be fitted to all sizes.

Save 10% to 30% of Your Feed

The saving of feed by cutting it up with an Acme Cutter has been demonstrated by many Pacific Coast Dairymen to be more than enough to pay for the cutter in one season.

It is the habit of stock, whenever given an abundance of feed to pick out and eat only the finer and more palatable portions; nosing out and wasting weeds and foxtail and the stemmy part.

This loss ranges from 10% to 30%, the amount depending upon the quality of the hay and the method of feeding.

Chopped Hay, with careful handling, will keep five cows, while the same weight of loose or bulk hay will only keep four. Waste is eliminated by chopping your hay.

Men who dairy on a business basis find that chopped feed is the surest way to utilize to the fullest extent the feed value of the entire hay crop.

The durable steel framed Acme will earn its cost every season chopping hay and at the same time provide you with a Silo Filler of superior cutting ability and an Alfalfa Meal Machine.

A FEW SPECIAL FEATURES OF ACME CONSTRUCTION

All steel triple frame construction.

Center hung blower fitted with six arm blower fan that will not clog.

Big range of pulley sizes permits in speed of cutting head and blower to suit length of cut and height of silo. All gears are well guarded.

Soft steel shear pins through fly wheel and pulley prevent accidents to machine or operator. Reverse lever with gears enclosed in housing. No ratchet to stick at critical moment.

Immediate deliveries.

Don't Buy a Cutter Until You Know All About The Acme

Fresno, Bakersfield, Taft

Let the SUN give you plenty of HOT WATER

DAY & NIGHT

SEEMS impossible, doesn't it: But a DAY & NIGHT Solar Heater will actually deliver an abundance of piping hot water in your home every hour of the twenty-four, because it concentrates and stores the heat of the sun's rays. Thousands of successful installations in Southern California provide actual proof.

Think of the saving in gas this system insures you—fully three-fourths of your expense of heating water. Think what a necessity the DAY & NIGHT is if you have no gas supply. Adapted to country or city home—mansion, bungalow. Can be installed in new buildings or old; no expense after first cost. Write for illustrated folder giving detailed explanation of the DAY & NIGHT. Address Dept., E.

Experimental Feeding Test in Arizona

By William E. Schneider

RESULTS secured from feeding range steers at the Arizona college of agriculture branch station at Mesa, Arizona, during the past winter are now available. The feeding this year is of special interest because tests have thrown some light on the value of several important by-product feeds and also from the fact that they were followed through the plant of the Arizona Packing Company at Phoenix.

These 50 head of common range bred and raised two year old steers were purchased in the vicinity of Prescott during the latter part of December and shipped to the experimental farm near Mesa under the direction of Professor E. B. Stanley of the animal husbandry department of the Arizona college of agriculture. They were divided into six lots of eight steers each, so that in weight, condition and general appearance the lots were as nearly as possible alike. During the first ten days there were fed corn silage and alfalfa hay at liberty, starting on the test on January 26.

On account of the poor condition of range pastures in Arizona during the past year, cattle and sheep came through the winter with greater losses and in poorer condition than usually. The mortality, according to the bureau of crop estimate reporters, is 100 per thousand compared with 35 per thousand last year. Spring pastures in Arizona on May 1 are about 55 per cent of normal compared with 96 per cent a year ago. Fat cattle have been scarce within the state as compared with a year ago. A number of large companies are shipping out trainloads of cattle to Montana, North Dakota and Kansas for stocking the ranges.

A year ago the increase in cotton acreage in the state served to drive out considerable acreage devoted to alfalfa, while the utilization of such products as cottonseed meal, whole cotton seed and cottonseed hulls was a problem to be solved. The low price for these products on account of the decreased valuation of all farm products last fall led the animal husbandry division to conduct the feeding experiment with a view of ascertaining the advisability of feeding cottonseed by-products with corn silage and alfalfa hay.

The rations consisted of: Lot 1, alfalfa hay, corn silage and cottonseed meal; 2, alfalfa hay, corn silage and whole cotton seed; 3, alfalfa hay, corn silage and crushed cotton seed; 4, silage and cottonseed meal; 5, alfalfa, corn silage and cottonseed meal; 6, cottonseed hulls and cottonseed meal.

Many stockmen have been skeptical as to use of silage for fattening. They have always admitted its excellence as a ration for dairy cows or for roughing stock cattle through the winter, but not a few have contended that it could not be successfully used in finishing. Corn can be most successfully grown in practically all sections of Arizona to the point where it is ready for ensiling, and the recent feeding tests have proven its future in the feeding industry of this state.

The most important result of special interest to feeders is the uniform and rapid gains of the eight head that had been fed a ration of 3.84 pounds of cottonseed meal, 47.71 pounds of corn silage and 2.10 pounds of alfalfa hay. This lot started with an average weight of 718.8 pounds and in 90 days weighed 963 pounds per steer. It must also be noticed that steers in poor condition off the range require a longer feeding period than 90 days to be put in marketable fat condition. Arizona butchers and packers do not demand fat stuff.

Based on One Average Steer—January 26 to April 26, 1921, Mesa, Arizona

Prices of feeds: Alfalfa hay $24, whole cottonseed $10, cotton seed hulls $12, corn silage $8, crushed cotton seed $12, cotton seed meal $30.

WORLD PRICES LOWER FOR MEAT AND LIVESTOCK

The recent declines in livestock and meat prices in the United States appear to be part of a world wide movement toward lower price levels, say specialists of the bureau of markets, United States department of agriculture. According to a report of the consul general at Auckland, recently received by the department, rump steak in New Zealand brought on April 1, 20 cents a pound; sirloin steak, 15 cents; corned brisket, 8 cents; legs of mutton, 11 cents; mutton chops, 13 cents; neck and breast of mutton, 7 cents; side of mutton, 10 cents; and veal, 9 cents. These prices are based upon the normal rate of $4.8665 to the pound sterling.

The report also shows that between March 1, 1920, and March 1, 1921, fine steers in New Zealand dropped $3.65 per 100 pounds, selling at $10.46; prime and choice steers, $3.52, at $9.49 to $10.21; plain and ordinary steers, $4.01, at $7.30 to $9; cows and heifers, $5.22, at $4.87 to $9.73. Best wethers lost $2.71 per head, selling at $4.62 to $7.47; ewes, 67 cents, at $3.89 to $6.08; and lambs, $1.82, at $3.40 to $6.44.

Comparisons of these prices with prices in American markets is impossible because of a difference in standards of grading in the two countries. For example, a choice steer in New Zealand might be placed in some other grade in the United States.

DAIRYMAN SAYS COW TESTER WOKE HIM UP

"I just wish to write a few words to let the farmers in general know what I thought of cow testing associations a year ago and what I think of them now," writes a Wisconsin dairyman to a field agent of the dairy division, United States department of agriculture. "About a year ago I was approached on the subject, and, after some talk, I said: 'Go ahead; if you can shoot in $40 or $50 I can, too.' So in April, 1920, we organized; and to top it they elected me secretary of the association. I did not think much more about it until the tester came to my place the first time, and when I saw him at work I commenced to wake up.

"I had two cows that had freshened about three weeks before that, and both of them had heifer calves which I intended to sell for veal; but after the test was made I saw that those two cows were making more butterfat for the month than any of my other cows. I decided to keep the calves, and further took interest enough to weigh the milk from each cow in my herd, and now those two cows are at the top of the list for the whole association.

"You may ask, what about those two calves? Well, if you have $300 you might get them, but not for less than that, even if they are grades. Does testing pay? Well, I will say yes, and if I can keep the association going next year, you bet I will."

No More Reason why You Should Milk by Hand than Harvest by Hand

The De Laval Milker

saves more time during a year than a grain binder or any other labor-saving device a dairyman can own. In addition it increases the production of milk, many De Laval users say, to such an extent that the increased flow alone pays for the milker.

EASY TERMS can be arranged so that you can use the De Laval Milker while it pays for itself. Send for complete information.

Milker or Cream Separator

NATIONAL EGG LAYING CONTEST

By T. W. Noland, Director, Mountain Grove, Missouri

June is the month when the fight against mites in the poultry house should begin in earnest. The next few months is when the poultryman will experience the greatest difficulty in keeping down these pests.

Clean and spray all poultry houses, coops and brooders, remove dropping boards and perches, spray underneath as well as on top; get the spray material into all cracks and crevices, as this is where they go during the day and then get on the fowls at night. One-half pint crude carbolic acid to one gallon of kerosene makes a good spray and will get rid of mites if you get it on them or in the places where they harbor.

The 300 hens in the tenth National egg laying contest laid 6,138 eggs during the month of May, or an average of 20.46 eggs per hen.

Pen 34, White Wyandottes, owned by Brann & Walker, Memphis, Missouri, won the cup for May by laying 130 eggs during the month.

The number of eggs laid by the different breeds for the month and to date are: Leghorns, 1,150 for May, 6,562 to date; Wyandottes, 1,002, 6,191; Anconas, 972, 6,088; Rhode Island Reds, 978, 5,945; Plymouth Rocks, 1,022, 5,933; miscellaneous varieties, 1,014, 5,854.

The ten leading pens for May are: White Wyandottes, Missouri, 130 eggs; S. C. White Leghorns, England, 128; S. C. White Leghorns, Missouri, 128; R. C. Barred Rhinelanders, Michigan, 128; R. C. Black Rhinelanders, Michigan, 125; Anconas, Missouri, 124; Barred Rocks, Canada, 123; S. C. White Leghorns, Illinois, 122; S. C. Brown Leghorns, Missouri, 121; Anconas, Missouri, 120; S. C. White Leghorns, New York, 120.

The ten leading pens to date are: S. C. White Leghorns, Missouri, 789 eggs; White Wyandottes, Missouri, 771; S. C. White Leghorns, Missouri, 767; S. C. White Leghorns, England, 765; S. C. White Leghorns, New York, 711; R. C. Barred Rhinelanders, Michigan, 711; S. C. Reds, Missouri, 707; Columbian Rocks, Missouri, 699; Black Langshans, Missouri, 698; White Wyandottes, Illinois, 691.

Following is the number of hens laying 25 or more eggs during May: 1 S. C. Red hen laid 30 eggs; 1 Columbian Rock hen laid 29; 2 Barred Rock hens laid 29; 2 S. C. Red hens laid 29; 3 S. C. White Leghorn hens laid 29; 1 R. C. Black Rhinelander hen laid 28; 1 Barred Rock hen laid 28; 1 S. C. Red hen laid 28; 3 White Wyandotte hens laid 28; 1 S. C. White Leghorn hen laid 28; 1 R. C. Barred Rhinelander hen laid 27; 2 Columbian Rock hens laid 27; 2 Barred Rock hens laid 27; 1 Buff Rock hen laid 27; 1 S. C. Red hen laid 27; 2 Ancona hens laid 27; 5 S. C. White Leghorn hens laid 27; 3 B. C. Barrred Rhinelander hens laid 26; 1 Black Langshan hen laid 26; 1 R. I. White hen laid 26; 1 Silver Campine hen laid 26; 1 Black Minorca hen laid 26; 1 Columbian Rock hen laid 26; 2 Barred Rock hens laid 26; 3 S. C. Red hens laid 26; 2 Ancona hens laid 26; 1 White Wyandotte hen laid 26; 7 S. C. White Leghorn hens laid 26; 2 R. C. Black Rhinelander hens laid 25; 1 Columbian Rock hen laid 25; 3 Barred Rock hens laid 25; 1 S. C. Red hen laid 25; 2 Ancona hens laid 25; 6 White Wyandotte hens laid 25; 3 S. C. White Leghorn hens laid 25.

Sales value of eggs average bird for May, 33 cents. Sales value of eggs average bird to date, $3.66. Sales value of eggs best pen for May, $2.08. Sales value of eggs best pen to date, $29.20. Average price received for eggs during May, 19 cents per dozen.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, May 30, 1921.—Report for week ending May 29:

The hens in the egg laying contest at Storrs finished the month with a margin of more than 7,000 eggs in excess of the expected yield for the first seven months. During the last six years the average total score for all pens on June 1 has been 86,000, but in the contest now running the hens have started June with over 93,000 eggs to their credit.

In the thirtieth week of the race White Leghorns made distinct gains on the heavier breeds. John K. Roessner's pen from Irvington, New Jersey, was in first place with a yield of 60 eggs. Burchell & Janson's birds from Thetis Island, B. C., were second best for the week with a production of 58 eggs.

Many poultrymen are obliged to confine their birds in relatively small yards. It is therefore necessary for them to grow summer green food if they expect to get the maximum number of summer eggs which usually sell for a fair price and which cost less to produce than eggs in mid-winter. Four or five rows 25 feet long planted now to Swiss chard and four or five rows planted to rape will produce all the green food that 100 hens can possibly consume during the months of July, August and September.

The four leading pens in each of the principal varieties are as follows:

Plymouth Rocks

W. H. B. Kent (Barred), 1,217 eggs; Rock Rose Farm (Barred), 1,083; Jules F. Francais (Barred Rocks), 953; James F. Macdonald (White Rocks), 949.

Rhode Island Reds

Charles H. Lane, 1,276 eggs; H. S. Bickford, 1,164; F. S. Chapin, 1,150; Henry P. Walker, 1,128.

White Leghorns

L. E. Ingoldsby, 1,181 eggs; Hollywood Farm, 1,177; James O. Le Fevre, 1,170; Ernest H. Scott, 1,156.

Other Varieties

Obed G. Knight (White Wyandottes), 1,322 eggs; H. P. Cloyes (Buff Wyandottes), 1,069; A. E. Hampton (Black Leghorns), 938; Harry D. Emmons (White Wyandottes), 838.

Poultry Queries

Conducted by Jean A. Koethen

Enlarged Crop

Our turkey hen and one pullet have enlarged crops. The turkey's is immense and filled with liquid and undigested feed with disagreeable odor. They have unlimited range and are fed Kafir or Gyp corn, rolled oats, lately some rice, and have a dry mash of bran, Surelay and alfalfa meal. About twice a week we put medicine in the drinking water.—A Subscriber, Marysville.

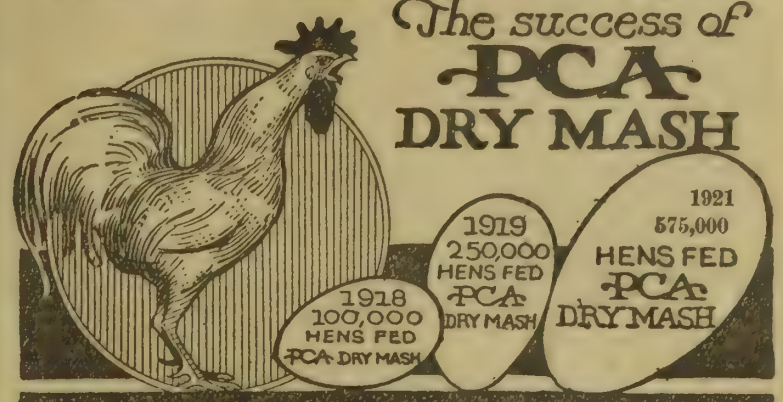
A Record that Speaks for Itself

The success of
PCA DRY MASH



Something to crow about

STEADILY increasing demand demonstrates the superiority of P. C. A. Products. Today they are used exclusively on scores of the biggest poultry ranches in the Southwest. Surely such a record points the way to obtain greater egg production. Hens must be kept in a healthy, vigorous condition to maintain a high laying average, and there is no surer way to increase the laying ability of a hen than by feeding the perfectly balanced P. C. A. Products.

P. C. A. Dry Mash has won its way on sheer merit. It was evolved by an association of practical poultrymen after exhaustive tests and experiments.

Copies of "Co-operative Poultrymen," a journal of practical information for the Poultrymen, published by us, sent free to readers of California Cultivator. Kindly address your inquiry to Dept. B.

Asparagus: Market firm; supplies moderate. Local: 16@18 pef lb.; Northern 6@12 per lb.; mostly 8@10.

Beans: Supplies heavy. Green Kentucky Wonders, mostly 4@5 lb.

Beets: Doz., 35@40.

Cabbage: Field crate best mostly 1.75@2.00; poorer, 1.50.

Carrots: Doz., 35@40.

Celery: Supplies moderate, market steady, mostly 6.00@6.50.

Corn: Supplies moderate, market weaker, best 40@50 per doz., 1.75 lug.

Cucumbers: Supplies heavy, movement slow, market weak. Local: Lugs mostly 1.25@1.50. Signal Hill: Flats mostly 50@75. Hothouse, per doz., 1.00@1.25.

Lettuce: Local field crate quality poor. Poor, 60@75; best, 85@1.00; few 1.10@1.25.

Peppers: Supplies liberal, market firm. Imperial Valley: Bells best, 20; Chilis, best 15@18 per lb.; poorer 12.

Radishes: 15 doz.

Rhubarb: Local strawberry, best 85@1.10; fy. 1.10; poorer 65@75 bx.

Squash: Supplies moderate, market weaker. Summer squash: Local, 50@65 per lug; Italian, 1.25 per lug.

Tomatoes: Supplies liberal, market weak. Imperial Valley, per crate, 1.50@1.75; jobbing, 1.60@1.75 on fancy ripes; mostly 1.25 on greens and pinks.

Turnips: Doz., mostly 40@45.

FRESH FRUITS

Apricots: Market steady, mostly 5@6 lb.; poor low as 4@4½; few fancy 7.

Blackberries: Supplies moderate, market weaker. Best 3.25@3.75; few 4.00.

Cantaloupes: Supplies heavy, market weak, ponys 1.90@2.10, standards 2.25@2.50, few early sales flats 90. Jobbing: Standards 2.00@2.50, mostly 2.00@2.25, ponys 1.75@2.00, mostly 1.75.

Cherries: Supplies light, market firm on good stock. White, varieus varieties mostly 11@15 per lb.; Black Tartarians and Republicans mostly 10@15 per lb.

Loganberries: Supplies moderate, market weaker; 30 pint crates 2.50@2.80.

Peaches: Supplies liberal, market weak, various varieties 5@7; few 8; lug, mostly 1.40@1.50; ordinary 75@1.00.

Plums: Supplies moderate, market steady, 6@8 per lb., poorer 5.

Raspberries: Supplies moderate; mostly 2.75@3.00 per 30 pint crate; few fancy 3.25.

Strawberries: Supplies moderate, market weak. Per crate, 30 pints best mostly 4.75@5.25; ordinary 3.50@4.00.

Watermelons: Supplies heavy, market weaker, mostly 2½@3 per lb.; jobbing 30.00 ton.

CITRUS FRUITS

Grapefruit: Supplies liberal, market steady on good stock. Local: per box, market pack 2.00@2.50, special packed brands 3.00@3.25; ordinary 1.25.

Lemons: Supplies moderate, market steady, wide range in prices. Local: packed box 4.50@5.00; few fy. high as 7.00; loose 1.25@1.75 per box, per lug mostly 50@75.

Oranges: Supplies liberal, market steady. Valencias, best brands, all sizes, 3.50@4.00, few 4.50; ordinary 3.00@3.25; packing house culls 50@75, few best 1.00@1.75 per box.

HONEY

As reported by the Bureau of Markets: Supplies of White Sage and White Orange light, of other varieties heavy. Light wire inquiry. Movement slow, market dull. Carloads f. o. b. usual terms at loading points: White Orange, old, 10@11, few 9; new crop, 12@12½; White Sage, 10@11; Light Amber Alfalfa, old, 5¾; new crop, 6½; Light Amber sage, 8@8½; Hawaiian White, 6½@7; Light Amber, 5½@6; Honey Dew honey, 4½. Beeswax, in less than car lots: Light, 30; dark, low as 26. Heavy rains have helped the sage crop. The orange crop is now estimated at 30 per cent of normal, sage at 50 per cent. The above prices represent quotations at which carload lots can be bought. In small quantities higher prices are secured. For example, less than car lots of White Orange have sold for 12@15 in 60-lb. cans. In 2, 5 and 10-lb tins much higher figures are listed for the same grades of honey.

GRAIN AND FEEDS

Grain Exch. price bid June 14:
Corn: Bulk No. 2, Yellow 1.61¼.
Kaffir: Eastern, No. 2, 1.80.
Milo: No. 3 Eastern bulk, 1.75.
Barley: Carloads, 1.10.

HAY

Alfalfa Growers of California report under date of June 15:

No. 1 Dairy 25.00
Standard 20.00
Fertilizer 15.00

Receipts of alfalfa hay during the week continued light for this time of the year. Prices remained firm, especially for the better grades. Offerings for forward shipment of these grades are also light, so that our sales of round lots during the week consisted largely of hay spoiled by the rains, to be used as fertilizer in the orange districts; prices paid for these lots were from $14 to $15 per ton delivered. The period of the heavy movement of the alfalfa crop, which is also the period during which dealers and users accumulate reserve supplies for fall and winter, will this year undoubtedly be shorter than usual. As far as the year's supply of first class hay is concerned, this will probably also be short as it will have to come practically altogether from the remaining cuttings. Grain hay in strong demand, especially in the southern part of the state, where the production this year is very deficient, owing to unfavorable weather conditions.

Prices at ranch are: Hemet and Perris, $20; Chino, $21; Antelope Valley, $18.50; Mojave River Valley, $20; San Joaquin Valley, $17.

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats .....20.00@28.00
Barley .....16.00@24.00
Alfalfa, No. 1 Dairy 22.00
Standard 16.00
Straw .....10.00@13.00

San Francisco Markets

San Francisco, June 14, 1921.

Quotations made daily by San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

Cranberries	6.75
Bayos	10.65
Blackeyes	8.00

HAY AND FEED

Alfalfa Growers of California quote June 13:

No. 1 Dairy	17.00
Standard	15.00

Under date of June 4, A. W. Scott Co. says:

Receipts past week 1,283 tons as compared with last week's arrival of 980 tons. Demand has continued light and the heavy receipts have created an extremely weak condition in the local market. While the rains have damaged large quantities of hay the recent fine weather has enabled the farmer to save and cure the greater part of the damaged stock, and the abundant moisture has accomplished wonders with the growing grain. Sales in the country have not been heavy as most producers are not inclined to accept present market prices, feeling that they are below cost of production. Still, a few sales are reported in all sections, and in all probability they will increase as hay is baled up and ready for the market. Export and coastwise shipment has been greatly interrupted by reason of the transportation strikes and will be in an upset condition until these matters are settled. Alfalfa continues exceedingly weak. In a number of points farmers are endeavoring to maintain a level of prices considerably above the various markets, and are asking $15 per ton for first class second cutting new crop hay. Purchasers will not pay that price and quite a bulk has been sold in various producing centers at from $12 to $12.50 per ton. New wheat hay has made its appearance and the choice grades are moving slowly at quotations. No new tame oat hay has yet come into San Francisco. Volunteer and barley hay are in excess of demand and slow to move. Mill feeds have been weak and prices a little off, chiefly caused by the weakness in grain, apparently the effect of the drop in foreign exchange.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	18.00@20.00
Wheat Hay, light 5-wire bales	15.00@18.00
Tame Oat Hay	15.00@17.00
Wild Oat Hay, new crop	10.00@12.00
Barley Hay	10.00@12.00
Alfalfa Hay, new 2nd cutting	13.00@15.00
Alfalfa Hay, new first cutting	10.00@12.00
Stock Hay	10.00@12.00
Barley, Ground	30.00@33.00
Barley, Rolled	27.00@29.00
Oats, Rolled Feed	35.00@37.00
Bran, Red	33.00@36.00
Bran, White	37.00@39.00
Millrun	36.00@40.00
Middlings	46.00@48.00
Linseed Meal	35.50@37.50
Coco Meal	23.00@27.00
Alfalfa Meal, old crop	24.00@26.00
Alfalfa Meal, new first cutting	22.00@23.00
Cottonseed Meal	35.00@40.00
Sugar Beet Pulp	32.00
Molasses, Tanks	21.00
Molasses, Bbl.	25.00
Milo	44.00@46.00
Corn Meal	45.00@47.00

GRAIN

Wheat: Milling, 2.40@2.50; semi-feed, 2.30@2.50.

Barley: Feed, 1.15@1.17½; shipping, 1.25@1.30.

Corn: California yellow, 1.35@1.45; white Egyptian, 2.10@2.25 per cental; California red milo, 1.75@1.85; Eastern red milo, 1.60@1.65; Eastern kafir, 1.50@1.55.

Citrus Markets

Los Angeles, June 15, 1921.

All oranges are selling at remarkably good prices. Small offs showing decay are sometimes severely cut but quality large size stuff occasionally brings as high as $8 to $9 in auctions.

Lemons are likewise commanding good prices. There are but few foreigns and some very favorable weather has encouraged liberal movement.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 26,567 cars; lemons, 6,475; total, 33,042. To same date last season: Oranges, 21,470; lemons, 5,073; total, 26,543. From Central California to date this seasonff Oranges, 6,571; lemons, 161; total, 6,732. To same date last season: Oranges, 5,359; lemons, 288; total, 5,647. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

POULTRY QUERIES

(Continued from Page 817.)

Enlarged or pendulous crop is usually caused by too heavy or irregular feeding while the birds are growing. If the crop is once filled to the limit it is likely to be stretched a little, and if this happens frequently the stretched condition becomes permanent. In the case of your old hen the feeding of too much corn may also have caused indigestion. The most successful turkey breeders feed mainly barley and mash and use corn only when they are fattening for market. Then the medicine you are using in the drinking water is neither a tonic nor a help to digestion, but an antiseptic, and has doubtless done more harm than good. It would be well to cut out the Kafir and Gyp corn altogether and stick to barley, wheat and rolled oats, and not too much of either. If the birds are on good range they do not require heavy feeding, and will forage more if they are kept hungry. For the pendulous crop the only remedy, outside of a surgical operation, is a tight bandage, which will not permit it to be filled. A little baking soda in the drinking water will relieve the sourness, but do not use it more than once or twice. Pure, clean water is absolutely necessary to the health of fowls.

Mash Formulas

We wish to mix our own mash for hens and for pullets. Will you kindly print a well balanced formula for each. We have R. I. Reds and are feeding beside the laying mash 2 parts milo, 1 part wheat and 3 parts (by measure) sprouted barley. Hens are confined in Corning house and are giving very satisfactory results. Would appreciate any suggestions.—Subscriber, San Diego.

The ration used at the California laying contest at Santa Cruz is probably as good as any for laying hens. The scratch mixture consists of equal parts by weight of wheat, cracked corn, milo maize and whole barley. The mash mixture contains 240 pounds bran, 180 pounds ground oats, 180 pounds middlings, 80 pounds soy bean meal, 60 pounds beef scrap, 60 pounds fish meal, 30 pounds charcoad and 4 pounds salt. As soon as they are thoroughly mature and beginning to lay the pullets should receive the same ration. To insure symmetrical development and put off laying till they are of suitable age and maturity, try this conditioning meal which is recommended by a prominent poultryman: Bran 640 pounds, low grade flour 200 pounds, ground wheat 200 pounds, corn meal 300 pounds, ground milo 200 pounds, high grade meat scrap 50 pounds, ground green bone 75 pounds, charcoal 35 pounds, salt, 10 pounds. This is put before the pullets as soon as the first egg is laid and kept before them till they are laying so many that they can no longer be held back. This matter of conditioning pullets will be taken up more fully at an early date. The scratch mixture you are feeding may be quite as good for R. I. Reds as the Santa Cruz mash which is intended for Leghorns and contains rather more corn than Reds need, especially in summer.

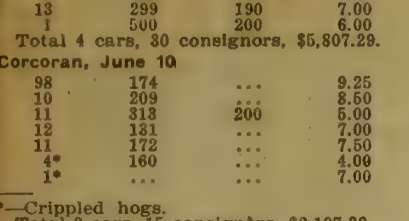
Fifty Years of Growth



THE first Byron Jackson pumps were produced nearly fifty years ago. But the test of an institution is more than age—it is growth of service to mankind.

These years represent an accumulation of public good will for the Byron Jackson product—an accrued dividend of a commodity honestly built to honestly serve.

Keep this in mind when you are buying a pump and remember the Byron Jackson pump will prove the cheapest in the long run.

Byron Jackson service is pre-eminent in the pump field

The right foundation for Biscuit-making

In this article Belle de Graf treats a topic dear to the hearts (and stomachs) of us all. Piping hot biscuits—what would our meals be without them? Nor is Mrs. de Graf content to stop at biscuits proper. For she proceeds to show how versatile is the biscuit dough foundation at the hands of the ingenious housewife.

—EDITOR.

PERHAPS you have never stopped to consider the possibilities of the ordinary biscuit dough. This mixture lends itself to an infinite variety of good dishes.

It is quickly mixed and baked, and has the additional advantage of being one of the most inexpensive mixtures to make. Many very palatable sweets can be prepared from this dough, besides several varieties of bread.

Biscuits, scones, shortcakes, meat pie crust, fruit dumplings (steamed or baked), cinnamon or raisin rolls, cheese puff—there seems to be no limit to the number of things it is possible to prepare by using the biscuit dough foundation.

However, you must bear in mind that biscuit mixtures, to be at their best, should be served while fresh, generally direct from the oven. A heavy biscuit is usually due to inaccurate measurements and too slow an oven. This class of dough takes a hot oven; in fact, this applies to most all breakfast breads. Then, too, the amount of baking powder for the quantity of flour must be correct.

When sweet milk is used, always remember that two level teaspoonfuls of baking powder are used to each cup of sifted flour. This never changes, no matter how many cups of flour you are using.

If you use sour milk or buttermilk, soda will be your leavening agent. In that case remember that one-half teaspoon soda is used to each cup of sour milk. Or, you can use one-fourth teaspoon soda to neutralize the acidity of one cup of sour milk and one teaspoon of baking powder to each cup of flour.

And here's a closing word of caution: Never dissolve soda in the sour milk, as that process releases the gases too soon and the dough will be less light. Always sift the soda with the flour for biscuit doughs. Sour milk can be substituted for sweet milk in any recipe if these rules are followed.

Sperry Baking Powder Biscuits

2 cups Sperry Drifted Snow Flour; 1 teaspoonful salt; 4 teaspoons baking powder; 2 tablespoons shortening; ¾ cup milk or equal parts of milk and water.

Mix and sift dry ingredients; work in shortening with knife or finger tips. Gradually add the liquid, mixing it with a knife to a soft dough. Toss on a floured board, pat or roll lightly to one-half inch in thickness, cut with biscuit cutter, place in pan, brush over the top with either melted shortening or milk. Bake in a hot oven twelve to fifteen minutes.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

According to the census of 1920 California has 115,759 goats. Nearly 80,000 of these are raised for fleeces. Presumably the greater proportion of the remainder, or some 36,000, are milk goats. Our greatest goat county is Tehama with slightly over 15,000. Doubtless practically all of these are raised for their fleeces. The number of goats in the state in 1910 was 138,413. It will be interesting to note the more complete returns when forwarded by the census bureau as to the increase in number of milk goats. The scene on the cover of this issue is not a California scene but may help in giving an idea to some of us of the great importance of the fleece goat in building up lands and proving a profit bringer, especially to lands of little value for other purposes.

* * *

The Curtis Corporation, packer of olives, has filed suit to recover damages to the extent of $1,000,000 from the board of health of the city of Detroit. This because of alleged rulings and publicity during the botulinus poisoning scare of a couple of years since.

* * *

Changes have been made in several state offices at Sacramento. Harry S. Maddox, formerly with the chamber of commerce of Yolo County, later with the Sacramento County chamber, and a short time ago appointed sealer of weights and measures, has been appointed state market director. Former Market Director Gilbert B. Daniels has been appointed by the governor to membership in the state board of control, succeeding Marshall De Motte, and by the board has been elected its chairman. Robert C. Melvin has been appointed to the weights and measures work. Presumably these appointments will hold only until the reorganization of these various departments under the state department of agriculture.

CARPENTER, D. Sc.

Dr. Ford A. Carpenter, author of article on Page 823 of this issue, has been honored within the last few days by Occidental College in the conferring of degree of Doctor of Science "for accomplishment in practical research in the field of aeronautic meteorology, for the successful application of the principles of weather science for the benefit of agriculture, thus contributing towards making the air safe and the ground productive."

Dr. Carpenter has entered an entirely new branch of agricultural work and is finding opportunity to give to producers information which makes for far greater certainty in farming operations which are affected by meteorological conditions.

The Los Angeles chamber of commerce has seen the importance of Dr. Carpenter's work, and he is gathering data which will prove of great value to future producers. In addition, his work has extended to several large ranch companies.

SALES TAX

I note your insertion in the center of Page 734, California Cultivator of June 4, 1921, of a quotation from H. C. McKenzie of the federal farm bureau.

I like to ask questions. Here is one: Why would not a federal sales tax give cooperation such a boost that in the long run it would benefit both the producer and consumer? Why not by cooperative buying and selling entirely eliminate the middleman and place cooperation on the proper basis?

If it were not for from three to six or more turnovers I could not buy cheaper from a mail order house than from my home town merchant. If he, Mr. Home T. Merchant, were forced into cooperative buying with the fellow across the street, in preference to going out of business, we would all benefit.

Now some of us would go broke during this "period of readjustment" just as we are likely to do anyhow, but I think this same sales tax would be a club which could and would be made to work both ways.

As an instance of how the sales tax might work I would think the California Associated Raisin Company could, by selling direct to the wholesaler, very much undersell an "independent" outfit.

If I am wrong, all wrong, be good enough to tell why.—Lawrence Beckwith, Tulare.

We cannot see where adding from three to six sales taxes to the price of the farmer's product will result in anything other than loss to him and ultimate disaster. The farmer never has been able to name his price. Price naming is possible in various "exchanges" or possibly at times by the ultimate consumer. It may be that by putting a burdensome tax on these products some of the middlemen will be forced out of existence, but our venture is that the middleman's power of passing the buck to the farmer will be no less under sales tax than it is today, and the most casual observer of us all has a reasonably close guess how this has operated in the past. The fact that our Tulare subscriber and others have not succeeded in making their home merchant quit because of patronage of mail order houses is one indication of how more burdensome taxes would not operate. The selling of our dozen of eggs direct to the consumer is attractive in theory, but as the world is now constituted the consumer has formed the habit of dealing with his home merchant, and there are advantages to him which will induce him to continue, and we do not believe that the world will take a step backward and eliminate the great distribution machinery.

Now this is not a word against cooperation in marketing, but we believe that the true cooperators in marketing coordinate their forces and handle marketing conditions as they now exist rather than as we wish they were.

UNFORTUNATE ATTACK

The United States Bureau of Public Roads made exhaustive investigation of California's state roads. There were 7,500 photographs taken; 638 cores were drilled in pavements at intervals on the 800 miles of highway between Red Bluff and San Diego; a traffic census was taken at 103 stations; a report covering 500 pages was made, and from its conclusions we note: "The work of the state highway commission and of the highway engineer shows a continuous and intelligent devotion to public duty. Their construction operations have been widely extended under greatly varying conditions. A high degree of standardization was doubtless necessary and is evident * * *. The operations have produced a large mileage of very serviceable roads and of continuing benefit to the state."

In transmitting the report Secretary Meredith said: "I trust this study may prove of service to the California highway commission and to the people of California in continuing their program of development upon which such splendid advancement has already been made."

The chief of the federal bureau stated: "The financial administration has been scrupulously honest and careful * * *. There should be no hesitation in going forward with confidence."

The Automobile Club of Southern California is mailing to its members under date of June 16 a return postcard ballot on which is opportunity to ballot on the matter of endorsement of the attitude of the club opposing the highway commission and its work, and attempting to show "that our state highways are inadequate to meet the needs of the traffic over them because built upon insufficient foundations, without proper preparation of subgrade * * * poorer in quality than similar highways now being built by other states, etc."

We presume the state highway commission makes no claim to producing the ultimate, or the perfect, highway. It is honestly endeavoring, however, to fulfill the demand of the voters of California. When they voted upon the proposition of bonding the state for $40,000,000, it was with the idea of a certain number of miles of construction on routes fairly definitely outlined at that time. War came on; costs went up; road bonds went down; and the commission has been confronted by difficulties other than those of mere heckling. The start was made with a four-inch by 15 foot base. Heavy traffic over these roads since the beginnings of their construction has increased some 1300 per cent, the four inch base proved inadequate, and in rice fields and alkali sections where a perfect sub-base could not be secured results were unsatisfactory. No one knows this better than the engineers of the commission.

Of course it has been best to widen and make heavier base construction. This has cost more money, and yet the commission is doing its utmost to reach the demands of the people in extending roads which will enable most economical transportation of our products to the markets and as quickly as possible. It has been estimated that the annual saving to producers and highway users of California is greater than the total cost of all California highways.

It is possible—and, in fact, the work already has been begun—to make heavier foundations of these earlier laid roads, and in practically all of the newer construction work in situations where the sub-base creates an unfortunate condition, reinforcing is practiced.

Californians take pride in their roads and we believe will look with little favor on the present attempt to discredit them.

Potato Planting in California by Climatic Surveys

By Dr. Ford A. Carpenter, Consulting Meteorologist

Illustrations by the Author

WHILE the climate of a place cannot be changed, yet when the meteorological factors are definitely known, land may be developed in accordance with these weather conditions, thus producing maximum efficiency. Of the three features, soil, water, and climate, the most important is climate. The factors of soil and water supply may be known and varied at will, but the value of the climatic factor cannot be determined until exact observations of accurate instruments and resulting studies are made. The procedure is now on a definite base, and in California we have the first direct and

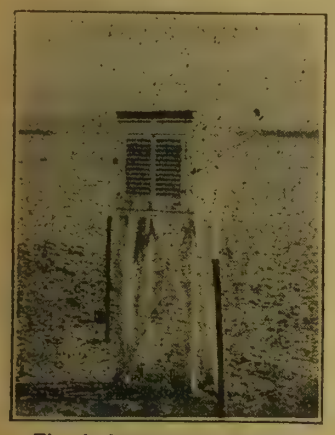

Fig. 1: Instrument Shelter.

In order to secure uniform temperature of the air and humidity observations, self-recording instruments are located in lattice covered boxes with double roofs. This method permits comparison with accepted meteorological standards.

practical application of agricultural climatology.

Two years ago a climatic survey of a large ranch in Southern California was begun and useful results secured at the very beginning. One feature was the planting of potatoes in various fields in an extensive valley on the ranch, and this in accordance with temperature contours. Initial work of this character was accomplished by the writer seven years ago on another large ranch in Southern California. The widest divergence in temperature and relative humidity has been found within short distances on both these ranches, and it is the correlation of successful crops with accurate air data that insures effective plantings. The margin between success and failure nowadays in agriculture is entirely too small to overlook any means which experience has proved efficient.

The subject of agricultural climatology is too extensive to be treated in detail within the compass of a magazine article, so attention will therefore be given to but one phase of the work, that of potato growing. Potato culture will be discussed, but only as planned with regard to temperature profiles of crop seasons and temperature contours of the district under consideration. By this method costly errors are prevented and absolute knowledge replaces the otherwise inevitable annual experimentation.

Instrumental equipment of known accuracy was naturally the first consideration. The thermometers had to be dependable, of the self recording variety and they had to be properly located. Thermographs, which record all variations in temperature minute by minute, were distributed generally over the valley. As the supply of recording instruments was limited, they were interspersed with standard (horizontal) recording minimum thermometers. The thermometers were calibrated; this was necessary although those of the best makers were selected. Thermometer exposure is shown by Fig. 1 which is an illustration of a standard U. S. weather bureau instrument shelter. Thermometers are thus sheltered because a number of errors enter into the readings of a thermometer exposed to the sun's rays. The instruments were visited at a regular hour each day by a trained field observer. The thermometers were read to the nearest tenth of a degree and the observation double checked. It has been found necessary to observe the utmost exactness in the matter of thermometer values, for slight differences in temperatures, which would pass unnoticed by an untrained person, ofttimes make or unmake the availability of the data for study.

Daily observations of temperatures were used in a diagram of variations in temperature of all of the stations. The daily variations are profiled by plotting actual temperatures in comparison with a "control" station. The profiling of the temperatures with relation to this control gives a definite basis for determining whether the several other locations are warmer or colder and the relative amount of variation. The control is shown on Fig. 3 as "Station C," and the other stations are designated by circled figures. Although much of the 40,000 acres of the ranch has been studied, only a relatively small portion is shown on the map. The district consists of a fertile valley of nearly uniform elevation above sea level. To all appearances it might be fancifully designated as a "lake of air," and the coldest portions would conform to the physical contours. Such, however, is not the case, for the orientation of the valley with relation to the land and sea breezes, the unequal heating of the north and south sides, and other causes contribute to much variation in temperature. The temperature diagram shows that within a quarter of a mile of the control station the growing season averages an increase of 30 days. In other words, plantings may be made approximately 15 days earlier in spring and harvested 15 days later in the autumn. The practical value of such a chart need hardly be emphasized to an experienced farmer. In the planting of potatoes, for example, it gave segregation to the one crop and the two crop districts. It also allowed the planting and seeding to be economically distributed. The diggers of the first crop and the planters of the second were able to work in harmony. This method greatly increased the value of the potato harvest of last year. This was partly owing to the extraordinarily high prices in 1920

Fig. 2. Diagram Showing Length of Growing Season

A control station is selected having a long and accurate record. The meteorological data are carefully checked, and yearly, monthly, and hourly comparisons are made in order to secure a satisfactory constant. The diagram shows by shaded lines proportionate period of year when temperature was above freezing point. For example, the longest growing season occurred during the year 1915, January 15 to November 10, and the shortest, April 2 to October 30 in 1919.

and partly to the increased acreage made available by the climatic survey. Photographs of some of the potato fields are shown in Fig. 4.

As to the practicability of using climatic surveys for all plantings it may be stated that results show two outstanding facts: First, that general dependence can be placed upon temperature contours, or isotherms, over a a year or two (the longer the observations the better) will bear the same relationship to each other whether a particular season be cold or warm, wet or dry. So then it will be necessary to secure a "general control" station in order to extend the climatic record over a period of years, thus obtaining "normals." Byron's line, "The best of prophets of the future is the past," is as true in meteorology as it is in history.

surveyed district for succeeding years, and second, that other crops may be successfully grown without actually trying them out by simply taking the temperatures of a successful crop and applying to the surveyed region.

As to the dependability of the contours of temperatures holding good for succeeding years, we may enunciate an axiom that variation in the climatic factors of a limited area will remain constant to each other. Local variations discovered over a period of

A "general control" station would, in all probability, be one of the several thousand cooperative U. S. weather bureau stations. Cooperative stations generally have suitable instrumental exposure for they are situated in the smaller towns and in places where the instruments have ground exposures. A station of this kind, being not too far distant and having a not too dissimilar climate, was used for general comparison in this survey.

In this article only two of the five climatic factors of temperature, humidity, rain, wind, and sunshine have been touched upon, and only one crop considered, but this introduction to the new application of weather science to farming may show the necessity of adding climatic surveys to soil and water supply investigations essential to successful agriculture.

Fig. 4. Where Temperature Contours Enabled Intelligent Harvesting Operation.

Photo on reader's left shows Early Rose potatoes planted the middle of April and dug early in June of 1920. They brought an unusually good price as they were of fine quality and averaged large as shown in the photograph which represents three separate hills. Shortly after the harvest was finished in the field shown on right the ground was immediately prepared for another planting as the temperature contours of this district showed a relatively short season. The second crop was gathered successfully.

Agricultural News Notes of the Pacific Coast

Northern California

Two large fruit packing houses at Newcastle, Placer County, burned last week.

Loma Rica colony, in Browns Valley irrigation district, will plant 900 acres to figs.

It is estimated that California will harvest 150,000 acres of rice this season.

A large winery at Healdsburg has been purchased by Sebastopol Apple Growers Union.

Clarksburg, Yolo County, farm center is encouraging the building of a union school and community hall.

Cherry growers are not very happy over demand shown for their fruit. Canners are offering few contracts.

The Mono County board of supervisors has decided to fence state highways through the county where necessary.

Twenty thousand dollars worth of shook stored for the coming table grape crop was burned at Lodi last week.

Butte County is already planning for the coming state fair and has its appropriation in hand to cover the exhibits.

Chico, Butte County, has a temporary landing for airplanes and expects soon to have a permanent one near Edgar Slough.

Prospects are reported good for the building of a railroad along the Pit River to the great lumber sections in Modoc County.

Cull rice, which formerly found free sale to brewers, is now proving to be one of the best stock feeds, especially valuable to poultrymen.

A Yuba County superior court judge has ruled that it is legal for an alien parent to convey by deed or gift property to children who are native born.

Those interested in the irrigation project in Grass Valley have secured funds in excess of $5,000 that will be sufficient to finance preliminary steps.

Farmers of Siskiyou County are being compelled by the fish and game commission to screen entrances of their irrigation ditches to keep out the fish.

Strawberry growers associations are making special efforts to dispose of their fresh fruit to retail dealers as canners seem unwilling to make contracts.

Modoc County wool producers say that they now have two or even three seasons' clip still in storage with "rumors of offers ranging from 17 to 22 cents."

More than 65 women representing eight of the farm home department centers of Alameda County gathered in annual picnic at Laurel Grove the last Wednesday in May. Reports of work accomplished show enthusiastic support of all the activities of the department.

Canning interests and Indian fishermen on the Klamath River in Humboldt County have started proceedings to prevent building of dams at the mouth of the Salmon River and south of Orleans. They say the building of these dams will ruin the spawning grounds on the Klamath.

Central California

Los Banos, Merced County, is building a new creamery.

Kings County reports a 45 per cent crop of apricots and peaches.

The California Olive Association reports prospects for heavy crop.

Stanislaus County planted two and a quarter million grapevines this season.

Exeter, Tulare County, shipped its first car of peaches and plums, June 1.

Prof. J. W. Nelson is planning to make survey of soil conditions in Stanislaus County.

Monterey and Santa Cruz Counties report salmon plentiful and running close to shore.

"West Side" farmers have contributed a carload of grain for Colorado flood sufferers.

A 20 acre vineyard at Kerman, Fresno County, was sold last week at $1,500 an acre.

The traveling school of fig growers in the San Joaquin Valley is reported a huge success.

Fresno County alfalfa growers have organized and will affiliate with the state association.

Melon growers of the valley recently met at Turlock and discussed marketing and shipping problems.

Madera County Milk Producers are signing up in the reorganization of the Milk Producers Association.

The Corcoran farm bureau center of Kings County is working to secure better mail service for that district.

Hughson, Stanislaus County, is planning to use the building of the big sorghum syrup factory for early season canning.

The Central California Milk Producers Association recently held meeting in Modesto, discussing work of the coming year.

All the apricot producing sections began cutting for drying earlier than usual. Lemoore cutting sheds were in full swing June 12.

A large factory has been established at Visalia for manufacture of grape juice, making special use of cull and second crop grapes.

The Pajaro Valley chamber of commerce is pushing for extension of good roads work and especially for completion of work now under way.

Farm Adviser Sullivan of Kings County has secured an assistant to aid in checking up experiments in pruning and fertilizing alfalfa.

Much of the wheat and barley put in west of the Kings River and in Huron Sinks has been a failure owing to dry weather and heavy winds.

The dairy department of the Kings County farm bureau claims to have added seven silos to the 25 in operation last year, through its silo campaign.

Fresh apricots are not commanding as fine prices as were expected in the East. The quality is fine but the buying public seems to have poor appetite.

The Lodi Tokay district expects its finest crop this season both in quality and quantity. Grapes of all varieties are reported setting heavily in that section.

Southern California

Palo Verde Valley has organized a drainage district.

Palo Verde Valley is making experimental plantings of hemp.

Melon shippers of the Imperial Valley are materially aided by the federal bureau of markets.

A new warehouse and packing house has been built at Yucaipa to receive fruit and vegetables.

Farm bureaus of Southern California are planning to make a combined exhibit at the state fair.

Santa Barbara and Ventura County walnut growers report "Walnut crop far advanced, big crop."

Southern California fair folks at Riverside are making bigger plans for their fair October 11-16.

Lima bean fields, replanting of which was made necessary by the rains, are now showing green again.

The farm bureau of Riverside County has made contracts for the printing of a new farm bureau monthly.

Riversiders are planning a memorial for Mrs. Tibbetts who planted the first two navel trees in California.

Imperial Valley people are planning celebration in honor of the completion of the Indio-Brawley highway.

Apricot orchards of Riverside and San Bernardino Counties report frost damage not so severe as feared.

Indian reservation near Banning has disposed of its apricot crop for $60 per ton, this, however, only for selected fruit.

A butter and egg storage plant has been opened at San Bernardino. The egg room has a capacity of 10,000 cases.

Garden Grove, Orange County, is planning for large participation in the Orange County fair at Huntington Beach.

Yucaipa Valley is ready to market Bing, Royal Anne and Lambert cherries. The Tartarians have all been shipped.

The Sespe Light and Power Company is beginning work on a great development project in the mountains of eastern Ventura County.

Santa Barbara farm bureau is observing farm bureau week. Every farmer in Santa Barbara County is being given opportunity to join.

Apricot dryers are pleased with the sunshine which has been given during the last few days. It has been an exceptionally cool, foggy season.

Coachella Valley, Riverside County, producers are discussing generating their own power, a step which is made necessary by excessive charges.

Citrus people have refused the offer of railways to give lower freight rates if the shippers would refrain from further plans for water shipments.

Riverside County Beekeepers met recently and discussed markets. An address was made by Manager Millspaugh of the State Honey Producers Exchange.

The newly formed date company is planning to take over the packing plant at Coachella, formerly owned by the California Date Growers Cooperative Association.

The Coast and General

Don C. Mote has been reappointed state entomologist of Arizona.

Arizona has 3,265 acres in cantaloupes this season; New Mexico, 2,200.

Prizes are being offered by the Signal Peak farm bureau of Pinal County, Arizona, for the best exhibit of six potatoes.

Chandler, Arizona, banks are back of the junior and vocational classes in agriculture in the purchase of pure bred calves and pigs.

The cooperative association of New Jersey cranberry growers reports an average price of $10.58 per barrel on a total of 82,516 barrels sold.

Construction charges on the Salt River Valley project for the years 1920 and 1921 have been deferred for a period of 12 months, dating from December 1, 1921.

The receipts of the Phoenix, Arizona, postoffice show an increase for the past five months, said to be the largest of any first class postoffice in the United States.

The dry weather still continues on the ranges of Arizona. With the exception of a few localities the range throughout the state is the poorest for many years. On the Mogollon plateau south of Flagstaff there is a small area where the grazing is good. In practically all other parts of the state the range is from 30 to 50 per cent of normal.

The Bankhead highway of the state has been routed through the following towns: From Rodeo, New Mexico, to Douglas, to Bisbee, to Tombstone, to Benson via Schieffiin Monument and St. David, to Vail via High Bridge to Tucson, to Florence, to Chandler, to Mesa, to Tempe, to Phoenix, to Hassayampa River via Coldwater, Buckeye and Palo Verde, to Agua Caliente via Summit pass, to Wellton via Palomas, crossing Gila River at Antelope Hill bridge, to Yuma via Dome, to El Centro, California, and then to San Diego.

E. S. Turville, county agricultural agent of Pinal County, Arizona, states that about 70 per cent of the grape cuttings put out this spring are living. Many of these were shipped in and were subjected to the hot water quarantine regulation which has resulted in the loss of many cuttings. As an example of what may be done he cites the case of one vine in the garden of D. H. Prettyman of Casa Grande. This was planted from a cutting March 1, 1920. On May 27, 1921, when it was inspected, it covered a space on a trellis 7½ feet high and 9 feet wide and carried 43 well filled clusters of grapes.

A California company has filed articles of incorporation for the building of a dam in the Colorado River, which it is claimed will produce 4,350,000 horsepower, equal to one-half of the total hydro-electric power now generated in the entire United States. Provisions are also being made for the irrigation of 2,250,000 acres. Arizona, Nevada and Utah, more than one-half of Colorado and New Mexico, and one-fifth of Idaho and Wyoming, with possibly large areas in northern Mexico, and three-quarters of the state of California may be served with electric power. The cost is estimated to be between $600,000,000 and $800,000,000.

Planning the Garden

By Ernest Braunton

THOSE having well established gardens may fancy they are not interested in garden planning; that it is a subject only for those about to solve the problems of a new piece of ground. There is no place of great extent, and but few small gardens, that could not be changed for the better, and there is no garden but may be changed somewhat, somehow and somewhere without much expense or sacrifice, so that all should be interested in the rules governing landscape gardening, now recognized as one of the fine arts.

Though there are many rules which govern the landscape designer they fall into three divisions and all others are subordinate: Preserve open centers; plant in masses; avoid straight lines. These three rules of three words each constitute the text of this garden sermon. Each rule is violated in our midst every day in some gardens. There are, of course, exceptions that cannot fall under these rules, but these are small city lots that necessarily dodge the third — "avoid straight lines." It is better, perhaps, in small places to have none but straight lines. One of the lesser rules of landscape art is that lines close to buildings should parallel those of the buildings. On a small lot one cannot get far enough from the house to diverge from these parallel lines.

Preserve Open Centers

A consideration of this rule presumes that we are to have one or more enclosures, that the garden owner is not one of the votaries of city fashion that dictates the open, unadorned lawn so common everywhere. We are to have a border plantation, a fence, wall, hedge, whether the latter be formal or informal the plan and planting will be orderly. The garden, especially in our climate, should be considered an outdoor extension of the house and therefore necessarily enclosed, and actually closed, by a gate.

Nature preserves open centers. We have broad stretches of open country or little glades surrounded by forests or woods, though far less common and less marked in California than elsewhere. But California is "unnatural" compared with other states; the plan and disposition of landscapes violate all "rules" so evident elsewhere, even as we violate this first and most important rule of landscape design. Few appreciate the possibilities of even the smallest lot. Instead of keeping the entrance walk to one side the front space is about equally divided by the concrete walk from street to front door. This leaves a space on either hand about as large as a tablecloth. In the center of these puny spaces a palm or other large growing plant is placed. Your "open center" has vanished. You can no longer stand in the front yard and view the landscape about you. Have your entrance walk near to one boundary, leaving not less than three feet, far preferable is six feet, on one side. Group shrubbery in the borders or margins so you will have a framed greensward. If you will have palms, plant the fan leaved or the beautiful Cocos plumosa in the borders; do not use the spreading date palms.

Plant in Masses

Do not isolate "specimens" in all parts or you have an orchard. Orchards are so disposed for economic reasons, ease and uniformity of irrigation, cultivation and harvesting to give each tree an equal space and chance. Art is not present or considered. All is based on utility, for commercial results. Group each kind of shrub or plant by itself, thus adding a character to that part. It may be acacias or roses or carnations. Do not have some of each plant in all parts of the garden or character is lost, and charm, interest, attractiveness have been shut out. Woman preserves open centers in the rooms by arranging the furniture around the walls. If the room is large chairs are grouped in corners and convenient parts, with other furniture intervening; chairs are not spaced one to every four or six feet, etc. Collections of minerals, Indian baskets and other curios are kept each by itself. See that the garden planting is so carried out whether it be of cabbages or chrysanthemums.

Do not crowd everything into the front yard and leave the rear garden bare. You have to live equally with both ends of the garden. Don't be like the timid street car passenger who asked: "Which end shall I get off?" And the sensible but caustic conductor answered: "Either; both ends stop." Both ends of the garden are yours and yours only. Don't plant for the public, the "look-at-me" type of garden, plant what you please and have a backyard laid out on the same plan as the frontyard and equally pleasing. The lawn here may be a drying ground, a place for children to play, perhaps an outdoor dining room. It may be better in size and effect than the frontyard, as often no bisecting path is necessary. One may have more of privacy, seclusion, intricacy of design than in the more public part, though all these points should be aimed at in all parts. Do not be afraid of massing or planting thickly or of crowding against the boundary. You do not get behind border plantations. They have but one face and that is toward you.

Avoid Straight Lines

Nature makes no straight lines nor can man without some contrivance like a ruler, straight-edge, taut string, etc. If one thoughtlessly strolls from one point to another, pursuing what he thinks is the shortest distance between two given points, he will find by looking backward he has made a path of faint but beautiful curves. All who have walked over freshly fallen snow know how far these paths diverge from straight line. The canopy above us, the horizon surrounding, the lines of bird or horse, river or lakeshore are graceful curves, never straight. Nature never intended man should make a straight line or try to. Economy alone moved him to make straight lines for crops, property lines, business streets, business buildings, etc.

But in avoiding straight lines do not be absurd. A walk of ten feet from street to door cannot well be curved. Neither should one curve that is only three or four times as long as its width. If it is a concrete walk of ten feet in width and 50 in length, it should be straight. Such a walk belongs to a school, church, library, etc.; it has no place in home grounds except it approaches a pretentious mansion. If 50 feet long and three to five feet wide it may curve. If possible do not have the gate opposite the front door so the public may look directly into the house. The latter is a private, not a public building; why should the same rules prevail? Plant a shrub or group of plants between the two points and make it appear necessary for the pedestrian to leave his course to avoid the object, even as animals in the cow trails avoid a rock, bush, knoll, etc.; even as a river is deflected from its course by a huge rock, cliff or other obstruction. Present a reason for curves other than an absurd desire to see things "squirm" or twist.

What is the true test of garden planning? How may you measure success? If the artist comes to sketch; the photographer, amateur or professional, calls to "snap"; if passersby stop to soberly study, even though mute, you have built a picture. Such effects woo all, child as well as adult, the busy man from the skyscraper, the tiller of the soil, the grave student or the thoughtlessly gay, to come again and again, perhaps to enter that they may the more admire. The tired, overtaxed worker, whether laborer or banker, will here find relaxation and rest, a return to nature. Would that all could so garden.

The Goat Industry in the United States

By Arthur L. Dahl

IN comparison to their size goats give very large amounts of milk, for the average doe will produce from two to three quarts a day or from 10 to 18 times her weight in milk annually.

Goat's milk does not have the "rich" appearance of cow's milk, since it is invariably pure white in color, but this does not imply that the milk lacks the food qualities of the cow's. The fat globules in goat's milk are very small and rise to the top very slowly, or not at all, so that the cream from goat's milk is seldom skimmed. From experiments made at the New York agricultural experiment station it was found that the fat in goat's milk varied from 3.2 to 4.4 per cent; the solids, other than fat, ranged from 7.72 to 8.61 per cent, and the total solids ranged between 11.4 and 11.9 per cent. A chemical study indicated that there is no essential difference between the constitution of its casein and that of cow's milk although marked differences were observed in the salts of the ash as compared with the ash of both cow's milk and human milk, but the effect of these differences has not been fully determined.

A large number of milk goats were kept for experimental purposes at the New York agricultural experiment station and the milk produced was used largely for infant feeding at one of the nearby infant asylums. It was found that the milk was especially valuable for building up the physical condition of very young children who lacked the ability to properly digest or assimilate other milks.

Goat milk is not used to any extent for making butter, but is in cheese making, and several distinct varieties are made entirely from goat's milk or a mixture of goat's and cow's milk.

While the number of goats in the United States is comparatively small the industry is growing, and it is said that there is a steady demand and ready market for all pure bred milk goats that are bred here. At the present time there are 304 farmers engaged in the business of breeding and developing pure bred milk goats, and over ten per cent of the goat farms are owned and operated by women. Several of the largest goat ranches are located in California, where the number of animals kept runs up over a thousand. Within recent years San Diego County is coming to the front as a goat developer, several large ranches there operating with different breeds of milk and fleece goats.

While there are a great many different breeds of goats in European countries only a few of them are found in considerable numbers in the United States. Of these the most important are the Toggenburg, Saanen, Nubian and Maltese. The Toggenburg comes from the valley of that name in Switzerland, where it has been bred for centuries. Its prevailing color is brown with white markings. As a rule this breed is hornless though horns sometimes develop in individuals. The head is long, ears of medium size and ordinarily held erect, the neck long and slender, and there is usually a beard which on the male is long and heavy. The goats are very hardy and do well in America.

The Saanen is another Swiss breed quite similar to the Toggenburg in general conformation but heavier. It is white or cream color and usually short haired.

The Nubian is a native of Nubia, Upper Egypt and Abyssinia and although a valuable breed is not very well represented in America. Its important peculiarities consist of long, drooping ears, convex face, forehead especially prominent, while there is a depression at the nostrils and the lower jaw projects slightly beyond the upper. The Nubian goat is large, with short fine hair, colored black, dark brown or tan, and with or without white markings. The breed will not stand as rigorous a climate as some of the other breeds, and most of those in this country are found in the southern part.

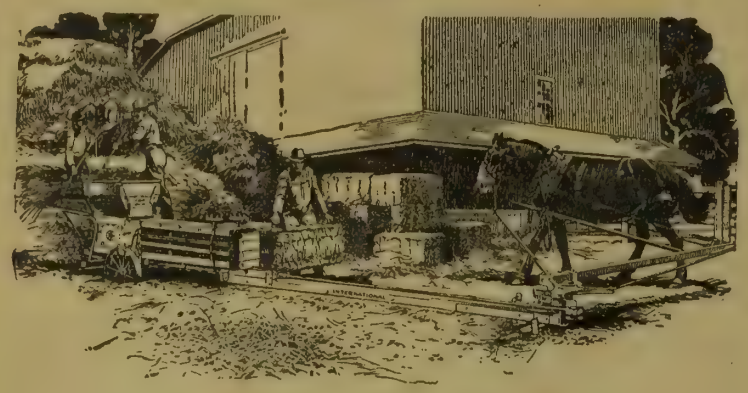
A number of Maltese goats are found in Texas and New Mexico where they have a good reputation as milk producers. This goat is white or grayish in color, but many have brown, black or reddish spots.

Throughout the South are to be found a large number of common, or "American" goats, but most of these are poor milk producers although they

(Continued on Page 832.)

Prices Have Been Reduced on International Hay Presses

The International Dealers will give you full particulars



YOU can depend on International hay presses to turn out, day after day, smooth, tight bales of hay or straw—bales that can be handled, hauled, stored and fed economically. Baled with an International press, your hay or straw should bring top prices.

International hay presses are correctly designed and sturdily built. The power arrangement delivers the greatest compression at the end of the stroke, where it is most needed. The spring roller-tucker folds down the straggling ends of hay, making the bales uniformly neat. These are only two of the many features which make International presses thoroughly dependable.

The International hay press catalog shows why it pays to own one of these presses—a postal request gets it.

In the meantime see your International dealer.

INTERNATIONAL HARVESTER COMPANY
CHICAGO OF AMERICA USA

Does This Interest You?

From a large grower and packer we have received the following letter:—

"Replying to your inquiry regarding our experience with Citrospray will say that we welcome this opportunity of telling you of the splendid results we have had both in controlling the scale and cleaning up the fungus with which the trees were infested.

"The fruit from the trees sprayed with Citrospray was of excellent quality, and arrived in the eastern markets without decay, bringing the top prices for fruit from this district.

"We did not get all of our orchards sprayed last year, and we figure that on one orchard of 12 acres our loss this year will be at least $5,000.00 on account of not being able to spray it. We won't let this occur again, however.

"Wishing you continued success in your good work, we are, etc."

Fumigation

SO long as fruit trees exist it is probable that insects will continue to levy tribute, and once the tribute is levied there is similarity to other taxes in that it is dead certain to be collected. Our orchardists have escaped, or at least secured a degree of relief, in a very few cases by fighting the injurious insects with other or beneficial insects. In this particular there have been one or two outstanding successes, especially in the vedalia-white scale fight.

The great mass of our injurious insects demand to be killed very dead before they will relinquish their right to levy tribute. The success of fumigation has been sufficient to cause the building up of a great industry in the manufacture of tents, of poisonous gases, and in organizing operating crews. Spraying has likewise proved efficacious, and in some cases is useful where fumigation is impossible. Such cases may be noted as red spider, aphis, and a number of other insects, and, of course, nearly all fungous or other plant diseases. Fumigation has been commended because of its success, and on the other hand has proved rather expensive, but the expense has been justified by its effectiveness, at least in the eyes of a great majority of the scale fighters.

Now comes the gas tight tent, at least it is here in theory and presumably soon will be in practice, and it is hoped that this will very materially reduce fumigation costs. We quoted some months ago from address by Prof. Quayle at the last citrus institute held at San Bernardino. We quote again from that address, giving only the summary, or general conclusions teached by Prof. Quayle:

Summary Made by Prof Quayle

With the use of gas tight covers not only better and more uniform results can be secured but results can be secured where it is not now possible to get results with canvas tents.

Wind (unless a strong wind) does not interfere with fumigation with gas tight tents and the results are not impaired as is the case even in a slight wind with canvas tents.

Humidity or moisture does not increase the injury to the tree because the gas tight tent does not vary in gas holding capacity. The tents also dry more quickly and mildew less readily.

Leakage of gas through the tent, which is the most variable and serious factor in fumigation, is prevented.

It is possible to determine a constant, or dosage for each scale, that will apply to any particular district.

Greater safety from injury to the tree and fruit, because there is less variability in dosage, is insured with gas tight tents. (This does not apply to work done in sunlight.)

With rubberized gas tight cloth the patching and repair work on tents is easily and quickly done in the field.

With the reduction in amount of hydrocyanic acid requred the use of gas tight covers should eventually reduce the cost of fumigation to the grower.

* * *

At the same institute J. A. Prizer, superintendent of the Merryman Fruit Company of Tulare County, gave a general review of a year's observation with spray pump and fumigation. Fumigation is very generally used in that field as is shown by Mr. Collins' figures taken from Mr. Prizer's address. Mr. Prizer said:

"The only scale insect of real importance in central California, and for which fumigation is practiced, is the Citricola. Fumigation for this pest has, on the whole, been very satisfactory. The records of the county horticultural commissioner, Chas. F. Collins, from 1916 to 1919 inclusive, show that a total of 10,192 acres was fumigated during this period, and of this amount there was rated as unsatisfactory only 94 acres. These records contain complete data on weather conditions, conditions of tents, time of exposure, dosage, cost of the work, and results for every orchard fumigated. Mr. Collins and his deputy commissioner, Frank Brann, both state that fumigation has been very successful in controlling citricola, and with such data to back them up we must accept this as final."

In this particular Mr. Prizer's conclusion is:

"It would seem that in cases of heavy infestation of scale the only means of control to employ is the same in Tulare County that it is in the south, fumigation. Then it would seem to be possible after a good fumigation to hold the scale in check and at the same time control the thrips by light summer spraying put on in May, June and the first part of July. If a program of this kind can be carried out, clean fruit of good quality will result."

NUTTING DATE TREES SAVED BY VALLEY RANCHERS

Says the Associated Grower: "The five year struggle of W. R. Nutting to establish the date industry in the San Joaquin Valley was saved from defeat by hundreds of ranchers last month visiting the Nutting date palm ranch near Sanger and carrying away thousands of young palms to plant on their own places. Mr. Nutting, having sold the ranch, was required to remove the palms and give possession. As a result of wide publicity in the newspapers and agricultural magazines of California and the appeal of W. E. Packard of the state land settlement service to salvage the palms and save to the San Joaquin Valley a possible industry of value, hundreds of ranchers have either bought the palms from Mr. Nutting or taken them from him with the expectation of growing them on shares.

"Mr. Nutting was very much gratified by the public spirit shown by the growers and as his original idea was to develop date palm growing on a co-operative basis, he believes that as a whole the situation for the future is promising. Just to what extent the date industry may develop in the San Joaquin Valley no man knows. While many varieties will not mature here, it is believed by such authorities as Professor Packard that careful supervision of the plant breeding will result in the development of a strain suited to our soils and climatic conditions.

"Thus another splendid dream of Mr. Nutting's may come true."

Book Review

MANUAL OF SUBTROPICAL FRUITS

"Manual of Tropical and Subtropical Fruits, Excluding the Banana, Coconut, Pineapple, Citrus, Olive and Fig," by Wilson Popenoe, agricultural explorer, United States department of agriculture, published by Macmillan Company, New York, for $5.00.

Wilson Popenoe has performed a distinct service in gathering this great fund of informaiton as to tropical and subtropical fruits. Among the hundred or more fruits discussed are the following: The avocado, which seems destined to rank with the olive because of its high oil content; the cherimoya and the sapodilla, neglected and delicious fruits for table use; the guava, the mango, the Chinese litchi, the breadfruit, the loquat, the papaya and the jujube.

It is a book of 474 pages, 16 chapters, a bibliography and a complete index. There are also 24 full plates including the frontispiece. Different chapters touch upon outlook for tropical fruit, avocado, mango, annonaceous, dates, papaya, loquat, myrtle including the guava, feijoa and many other fruits now little known in California, litchi, sapote, kaki or Japanese persimmon, pomegranate, mangosteen and breadfruit. In addition each of these chapters touches fully upon various relatives of the fruits under discussion. In the chapter on avocados there are four plates with many line drawings and nearly 70 pages of text. It is one of the most complete treatises on the avocado we have seen. It begins with the botanical description and then touches history, distribution of fruit, climate and soil, cultivation, propagation, picking, packing and mar-

keting. We believe the book may also be secured through F. O. Popence, Pasadena.

PINK BOLLWORM CONFERENCE

There was recently held in Washington, D. C., a conference of cotton growers to discuss the pink bollworm. There were representatives from Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas, Arkansas, Oklahoma, New Mexico, Arizona and California. California's representatives were F. W. Read of the state department of agriculture and Robert Armstrong of the International Cotton League of the West and the representative from Arizona was Don C. Mote. The conference made the following recommendations:

We indorse and commend the policies of the federal horticultural board in dealing with the pink bollworm situation in the United States. We wish, furthermore, to express our approval particularly of the work of Dr. W. D. Hunter, who has been in direct charge of the field work in the infested states; his energy, persistence and tact in dealing with an unusually difficult situation was especially to be commended. To his efforts and to those of the proper state authorities who have worked in cooperation with him, especially in Texas and Louisiana, the other cotton growing states feel deeply indebted that this pest has not spread more widely since 1917.

It is clear to the conference that the only practicable method of eradicating the pink bollworm is by the continued prohibition of the growth of cotton in infested districts for a period of years. The feasibility of extermination work where conducted according to the methods and maintained for the period of time recommended by the entomologists of the cotton states and approved by the federal horticultural board is completely demonstrated in the Hearne district, where a noncotton zone has been maintained since the fall of 1917 and intensive scouting each year thereafter has failed to show any recurrence of the infestation. Furthermore, it is apparent in the Trinity Bay district that the maintenance of a noncotton zone for one year is not long enough to accomplish extermination.

The conference believes that there is now a possibility of exterminating the pink bollworm but that this opportunity is one that must be taken prompt advantage of. On the other hand, we feel that the continuance of the infestation in any areas under regulated system is fraught with grave danger to the entire cotton industry. Therefore, we believe that the present establishment of regulated areas in west Texas and New Mexico should be considered only as a temporary arrangement, to be conducted only so long as may be necessary for appropriations to be made to maintain this district as a noncotton zone. In the meantime, also, we would recommend that efforts be made to secure the cooperation of the Mexican authorities in maintaining a noncotton zone on the Mexican side of the border. In order to provide further safeguard against the introduction of infestation we believe the immigration service should be so strengthened as to secure the movement of all laborers coming from Mexico into the United States through the proper points of entry where adequate inspections can be maintained.

In dealing with the pink bollworm situation adequate provisions by state laws should be made for a technical commission which should be vested with full authority in establishing the fact of infestation as well as exercising wide discretion in relation to the fixing of the limits of any areas which may be placed in noncotton zones or regulated zones, such zones to be continued in force automatically until changed by the act of the commission.

The remaining recommendations have to do with treatment, with conditions prevailing on the Mexican side of the line, with division of the costs of the eradication by various states directly interested and by the entire nation equally interested.

Tractor for Sale

Exceptional Offer

$1000 Cash

(Balance 12 Months)

Yuba 20-35 completely overhauled by the Los Angeles Yuba Agency, where it may be seen. The tractor is in good operating condition.

Price $2,000; $1,000 cash, balance by note, 12 months 7%.

STRENGTH OF AGRICULTURAL ORGANIZATION RESTS UPON INDIVIDUALITY

By Bronte A. Reynolds

In analyzing the record of agricultural history, hardly 75 years old, it is obvious that wherever successful results have been realized those results have been made possible only through the close application and intensive development of the farmers and fruit growers cooperative organizations. And, too, as we scan the lists for successes and failures, we find uppermost and flourishing to be those particular organizations wherein unity of purpose was realized only through the high degree of efficiency on the part of its individual members, and also we find that their well being is in direct proportion to their individual interest and efforts.

Viewing these performances of the past with retrospective eye, we may see without undue exaggeration how truly the indifferent, the skeptical and in many cases disloyal individuals, as members, constituted the weak links that spelled failure or retarded the activities of a given organization.

From time immemorial we have been taught, and we have seen, that the only true index of efficiency and its foster brother, economy, lies in the concentration of effort through one single centralized head, and any deviation from that order results at least in the temporary impairment of the functions of the organization at large.

If we may now assume that organized agriculture has at last attained its rightful place among industries; if we look forward to and expect greater things of the agriculture of the future, let us now as individuals place the credit for these things on our respective cooperative organizations that through the centralization of effort assure success.

PREMIUM LIST OUT

The California Association of Nurserymen is mailing premium list for the "First Annual California Flower and Horticultural Exhibit" to be held at Exposition Park, Los Angeles, October 20-23. Entries on potted plants, trees and shrubs will close at midnight, September 20, and entries on cut flowers will close October 15. The show and fair are to be given by the California Association of Nurserymen, and in connection with them will be the eleventh annual convention of the association.

A large section of the sunken garden at the park has been turned over to the management and work is already under way in the plotting and planting so that many of the exhibits will be seen under ordinary field culture conditions. Reservations in the sunken gardens may be made with O. W. Howard, while entrance blanks and premium lists may be secured of H. W. Kruckeberg, 236 Court Street, Los Angeles.

There are a few medals, diplomas and other honorary awards to be made, but the showing of premiums carries some long purses in addition.

In connection with the convention of the association the ladies auxiliary will hold its fifth annual meeting.

Gill

One-piece Piston Rings

eliminate pre-ignition troubles

because: they correct improper lubrication, which is the cause of fouled sparkplugs, pitted valves, and excessive carbon accumulation. And those are the harmful influences which give rise to pre-ignition troubles. Gill Piston Rings keep oil out of the combustion chamber not only because of the patented Gill leakless joint, but because they maintain a definite, firm, all-around, ***oil-proof*** contact with the cylinder walls through all the rigors of piston ring usage.

THE GILL MANUFACTURING COMPANY,

Identify the Gill One-piece Piston Ring by the joint, but do not measure its merit by the joint ***alone.***

Gill Service is nation wide. There are more than 2,500 stocks of Gill Piston Rings in the country. Some one of these dealers is located near you to supply you with whatever size you may want and the number you want ***when*** you want them. If your garage or repairman or accessory dealer doesn't happen to carry Gill One-piece Piston Rings tell him to get them from his jobber or from the nearest of our 39 Branch Offices.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Lease to Chinaman

Has a Chinaman the right to lease fruit land?—Subscriber, Sonora.

As between the lessor and lessee no prohibition has ever been made as to the leasing or purchasing of real property by aliens. The alien land law instituted by the initiative act in its essence declares that in an action brought by the state of California in its own name any title to or in real property of an alien not eligible to citizenship may on the judgment of the court be declared forfeit and escheat the estate. As between the individuals, however, such contracts are valid and enforceable.

Partition of Estate

Can the owner of an undivided interest in an estate secure an order compelling the sale and partition? This is opposed by the other owners owning three-fourths interest. — Subscriber, Los Angeles.

Such proceeding is authorized both before and after distribution of the estate. In the first instance, at any time after the elapse of four months from the issuance of letters testamentary or administration any heir or devisee or successor may present a petition to the court that his share of his estate be given to him upon giving bonds for his payment of the portion of the debts of the estate. Notice of this application is given to all other parties interested and if at the hearing it appear the estate is but little indebted, the court must make an order for the payment of such share upon the giving of bonds sufficient to cover the proportion of the debts due from the estate, but where there are no outstanding debts or where all such debts have been satisfied or secured with a mortgage the court may dispense with the bond. If a partition is necessary it must be ordered and made in the same manner as partition after final distribution, which constitutes the second case. Such partition may be ordered upon petition of any person interested after notice to all other of the parties interested in the estate. There are quite elaborate proceedings for the method of appointment of commissioners to make the partition, the method of equalizing the partition and the sale of the estate if it appears that it cannot be otherwise fairly divided.

Compulsory School Attendance

Does the compulsory school law require attendance during the whole of the eighth and sixteenth years, or may the child leave school after the sixteenth birthday even if only in the sixth grade What can be done to keep children in school who stay out a day or two each week? What can be done with trustees who neglect their duties with respect to the compulsory school law?—Subscriber.

The compulsory school law deals with children who have passed their eighth birthday and not yet attained their sixteenth birthday. After the sixteenth birthday they pass from the jurisdiction of this law, it matters not how far they have progressed in learning. The law imposes the obligation upon each parent, guardian, or other person having control or charge of any child under the purview of the law to send such child to a public full time day school for the full time for which the public schools are in session. If such parent or guardian fails so to do complaint may be made to the board of trustees or board of education by any person, the board must make an investigation of these charges, and if a violation of the act is found it is the duty of the clerk of the board to file a criminal complaint with the proper authorities and cause such charge to be prosecuted. It is made the duty of the board of trustees to appoint a truant officer to enforce the provisions of the act, or if no such truant officer is provided then the board of supervisors of the county may appoint. If the trustees fail to perform their duties under this act they are subject to removal in the same way as other officers, but a complaint made to the county superintendent of schools would probably have the proper effect.

Right of Survivorship

What exemption is allowed a husband who survives his wife under joint deed of survivorship?—Subscriber, Covina.

The provision of the inheritance act is that whenever property, real or personal, is held in the joint names of two or more persons, or deposited in such joint names, the right of the surviving joint tenant to such property shall be deemed a transfer taxable in the same manner as though the whole property belonged absolutely to the deceased joint tenant and had been devised by such decedent to the survivor by will, excepting such part as may be proved by the survivor to have originally belonged to him and never to the decedent. At another point in the act referring to this provision it is provided that in case of a transfer of community property of husband and wife held in joint tenancy one-half of such community property shall be held subject to the provisions of the act, provided further that the general presumption of law that property acquired after marriage is community property shall not apply for the purpose of the act, but the burden of proving such property to be community property shall rest upon the person claiming it as such community property. It is, therefore, quite difficult to state just what position the husband would be in in the case of such joint deed. Whether he would or would not be able to prove that it was community property would be one question. Another legal question would arise as to whether or not this act is in conflict with the general rule of community property. The husband's general exemption from tax is $10,000. In some of the eastern jurisdictions the opinions of the courts have failed to uphold the strict provisions of acts similar to this.

GROWTH OF FUNGI

The University of California has just issued a scientific bulletin entitled, The Temperature Relations of Growth in Certain Parasitic Fungi, by Prof. H. S. Fawcett. Four forms were used, all of them being parasitic on citrus trees. The one of most interest to our citrus growers is the brown rot of the lemon, a soil infesting fungus known to science as Pythiacystis citrophthora, named by Smith and Smith of the university. This fungus was found to develop best at a sustained temperature (for five days) of 75 degrees Fahrenheit. The other three fungi ranged from this to 82 degrees as the best temperature for highest rate of enlargement.

Opportunity Acres

Porterville Fruit and Farm Lands

The Heart of the San Joaquin Valley

THE FARMERS' PARADISE

TODAY IS YOUR CHANCE

To Obtain Some of the Best Farm Land in California

It Will Pay You to Investigate Opportunity Acres---Why?

Because---

Experienced farmers and agricultural experts—men who really know valuable land — have pronounced Opportunity Acres far superior to the world-famous Fresno grape lands. And in some instances grape lands around Fresno sell for $1,000 per acre and up.

Opportunity Acres lies in the heart of the San Joaquin Valley, famous the world over for the rich returns and the variety of crops successfully grown there.

Ideally situated, 4½ miles from Porterville, Tulare County, Opportunity Acres, a unit of 700 acres, is located in one of the most beautiful as well as profitable sections of the San Joaquin Valley. There is an abundance of pure water available from shallow wells, with a lift of less than 25 feet. Electric power serves this part of the valley.

Grapes, deciduous fruits of all kinds, berries, vegetables and all farm crops grow in luxurious abundance.

Opportunity Acres Can Be Had in 10 and 20 Acre Units

The Price of Opportunity Acres is Exceptional

$245 Per Acre $295

Don't Wait—Act Now and Secure the Choice Locations

Be Independent, Buy in Opportunity Acres Where Nature Works With You

For every lick of work that you put in, nature puts in manifold. Proof of this statement is the almost astounding returns that farmers receive from the lands adjacent to Opportunity Acres.

A few short years of real work will reward your efforts far beyond your most vivid expectations. If you are a young man, strike out for yourself, get onto the soil, the one place where success can be acquired by the least number of years of hard work. Experience the thrill which comes with that pride of possession of something real and worth while in life. Tingle with that deep satisfaction of ownership as you stand at sun-down and gaze upon the accomplishments of the day.

There is no pride equal to the pride of Success.

Opportunity Acres Plus a Few Years of Work Equals Success

This Is Your Chance—Take Advantage of It.
WE RECOMMEND AND STAND BACK OF EVERY ACRE OF THIS LAND.

Cut out the coupon below and mail it for full particulars.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dehorning Goat

Please tell how old Toggenburg kids should be to be dehorned. We did not take them young enough to use lunar caustic on them and I presume that the horns will have to be removed with a saw or with cutters. Which is the better, and what is the method of procedure?—Subscriber, Mecca.

The best way to remove horns from goat kids or from young calves is by the use of caustic just before or just as the horns break through the skin. After the horns have grown beyond this point it is necessary to cut them off. The use of a saw is preferable to the use of cutters, especially after the horn has become rather hard. The action of the cutters sometimes crushes the horn and cracks the portion remaining in the head, which often prevents it from healing properly. A saw is therefore desirable as it leaves no ill effects, although it takes a little longer to remove them by this method. The animal should be put in a stanchion where it can be held and the horns sawed off just as close to the head as possible. This makes a better looking job than if sawed a short way from the head and also prevents them from growing further. Usually there is some bleeding. Sometimes the horn bleeds rather profusely. There is seldom any danger of the animal losing too much blood, however. If blood continues to spurt out, a compress should be placed over the head to stop it. It is desirable to paint the base of the horn with pine tar, as this is a disinfectant, is healing and prevents flies from bothering. Pine tar can be applied two or three times if found desirable.—G.E.G.

Lame Cow

I have a cow lame in one hind leg. In stepping, toe turns backward and drags on ground until muscles or cords give a jerking thud and she is able to step forward all right. This occurs every two or three steps. She seems in good condition and gave a negative test for tuberculosis. Please let me know what is the matter and what can be done for her.—Subscriber, East Bakersfield.

It is difficult to diagnose the trouble with your cow. It would seem from the information available that she had perhaps been injured some way, either by a blow or by injuring her leg on a stump or fence or by slipping or falling in some way. The trouble may be caused by an injured muscle or an injured tendon which may have been bruised or may have slipped out of place. The trouble, of course, might be dislocated joint, which might slip in and out of place. It would undoubtedly be desirable to give your cow a rest, allowing her to stand just as still as possible, and it might be desirable, if convenient, to put a swing under her body which would relieve the weight on this leg. Such conditions sometimes correct themselves in time while on the other hand if allowed to run along, particularly if the trouble is in the muscles, sometimes the animal becomes permanently disabled. If you are not able to find the seat of the trouble I would suggest that you consult a veterinarian, who could undoubtedly diagnose the trouble for you.—G. E. G.

Yellow Star Thistle

Answering queries as to means of eradicating yellow star thistle, we have the following from Harry P. Stabler, horticultural commissioner of Sutter County:

"We have severe infestations of yellow star thistle in parts of the county, and wherever it is possible we find that putting the land into cultivated crops is successful in controlling it. In other places where rice can be grown the water used for flooding seems to be effective in controlling the thistle. Where neither rice nor cultivated crops can be resorted to we are advising owners of infested fields to summer fallow the land in order to discourage the thistle. Mowing is not a success as the plant will go on growing and will mature seeds. In slightly infested places hoeing off the plant just under the surface of the ground has given results. The pest is a serious one and the importance of its control is appreciated now more than ever before."

Earle Mills, horticultural commissioner of Butte County, writes:

"The yellow star thistle, being an annual, is quite readily controlled by ordinary cultural methods. The chief difficulty in eradicating this is along roadways and pasture areas and such other situations as are not easily cultivated. However, it is not entirely without its usefulness as a plant. In the early period of its growth before the barbs about the flower become stiff, stock feed upon it, sheep being quite fond of it; in fact, some of the large land holders object to having it destroyed on this account. It also serves a long felt want of the honey producers as the flower blossoms throughout the period of our summer when there seems to be a dearth of honey flow from other sources."

Powdery Mildew

Twigs of apple are badly infested with mildew. Have sprayed with Bordeaux. Will this be sufficient?—Subscriber, Los Angeles.

Powdery mildew is extremely hard to control, especially in a spring like the present. One trouble is that the application of a strong solution of Bordeaux endangers health of leaf. The apple leaf in growing rapidly, at this time of the year, is not tolerant of copper compounds. Lime-sulphur solution is somewhat less injurious. Even free use of powdered sulphur, if the orchardist could have occasional sunshine, would prove very beneficial.

Redwood Shavings

Have a chance to get plenty of shavings from a mill close by for use on the ground to keep in moisture. Have been told not to use redwood. What would you suggest? We have a sandy 'dobe soil.—Subscriber, Mt. View.

Redwood shavings contain sufficient tannin or other deleterious substances that they have at times caused serious injury to orchards on which they have been used as a mulch. They have, however, been used after long exposure to air and rains, when partially decayed, and have proved most beneficial. Pine and cedar shavings, on the other hand, have proved beneficial. Of course, if plowed into a sandy soil it would cause rapid drying and possibly injury to a limited extent. However, this would have a beneficial effect on heavy 'dobe soil. We imagine that safety would dictate not to use shavings or sawdust or like material in large quantities, but occasional light application might be handled and prove beneficial. For instance, if used in stables as absorbent and later applied to soil there would be less danger of injury and more economy because of the absorbed elements which would otherwise be wasted.

FIRST REPORT ON UNIVERSITY FARM MARIOUT

Mariout barley, the sensation of grain growers last year, will probably show equally good results in California this season, judging from the first report of 1921 yields. Assistant Farm Adviser Bougher of the Los Angeles County farm bureau says he has never seen a better stand of grain than on the hundred acre field of I. E. Miller at Lawndale, where the estimated yield was 30 to 35 sacks to the acre. Common barley planted on adjoining land was hardly good enough to cut, as a result of the dry spring winds which burned it up but did not affect the Mariout. Mr. Miller's yield of common barley last year was 15 to 17 sacks to the acre so he has just about doubled his yield by planting Mariout.

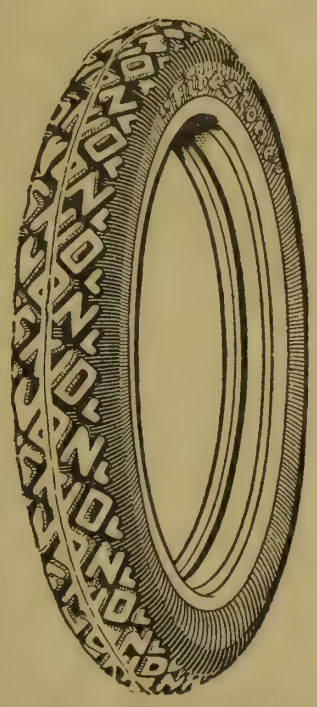
NEW SUGAR BEET

Material progress in the selection of types of sugar beets that will be resistant to the curly top leafhopper, a very destructive insect pest, is reported by specialists of the bureau of entomology, United States department of agriculture, who are investigating means for checking the pest's damage in California. A large series of mother beets, it is said, have been retained in cold storage during the last season, and a great supply of seed grown last year will be available for the resistance tests.

Some very promising types, reports say, have been selected and are being planted in isolated places throughout Riverside County, in order that the necessity of using bags on the seed stalks may be obviated.

Firestone

30x3½ Standard Non-Skid Tire



$13.95

This new low price is made possible by strictest economies and specialized production.

Plant No. 2 was erected for the sole purpose of making 30x3½-inch Non-Skid fabric tires. With a daily capacity of 16,000 tires and 20,000 tubes, this plant permits refined production on a quantity basis.

All materials used are the best obtainable. The quality is uniform. It is the best fabric tire ever offered to the car owner at any price.

Firestone Cord Tires

Tire repair men, who judge values best, class these tires as having the sturdiest carcass made. Forty-seven high-grade car manufacturers use them as standard equipment. They are the quality choice of cord users.

THE SAND CASTLE

The tide is out, and all the strand
Is glistening in the summer sun;
Let's build a castle of the sand—
Oh! will not that be glorious fun?

With walls and outworks wide and steep,
All round about we'll dig a moat,
And in the midst shall be the keep,
Where England's flag may proudly float.

And where a drawbridge ought to be,
We'll make a causeway to the shore,
Well paved with stones, for you and me
To get to land when tempests roar.

We'll sit within our citadel,
And watch the tide come over the rocks;
But we have built it strong and well;
It will not fall for common shocks.

The moat may fill, the waves may beat,
We watch the siege all undismayed,
Because, you know, we can retreat
Along the causeway we have made.

"Haul down your flag!" "Oh, no!" we shout,
Our drums and trumpets heard afar—
The castle sinks; but we march out
With all the honors of the war.—Anon.

HOME MADE PRESERVES

By W. V. Cruess

AT present (June 1) strawberries are abundant. Soon loganberries, blackberries, currants, then apricots, figs, peaches, pears, quinces and other preserving fruits will be with us in profusion. No other fruit product gives more pleasure in the preparing than fruit preserves. In the winter nothing tastes "quite so good" as rich syrupy preserves and hot biscuits. Making good preserves, it is true, is an art. Therefore, it might be argued that the successful preserver must possess natural talent and spend years of practice to master this art. However, it is not difficult, and if the principles are known, various good recipes can be followed successfully.

General Principles

The Fruit: Firm, ripe, well colored fruit only should be used for preserves. A good preserve should be whole, not broken, nor cooked to a pulp, and should retain an attractive color. Most preserves should be semi-transparent. The syrup should be clear and not caramelized (brown) in color.

Such a product can be best secured by the use of sound fruit of high quality and by observing certain fundamental principles, which follow:

Adding the Sugar: To tender fruit such as strawberries, loganberries, currants, etc., the sugar may be added direct. Some fruits shrivel and become tough if the dry sugar or if too heavy a syrup is added to them. This is the case with cherries, tough pears, quinces, kumquats, figs and cling peaches. Such fruits should be placed in a thin syrup, 30 degrees Balling or 15 degrees Baume, and the syrup boiled to a heavy consistency, 55 to 60 degrees Balling or 29 to 32 degrees Baume. This permits the sugar to penetrate the fruit as it is cooked and avoids shriveling and toughening. The same result can be attained by first boiling the fruit in water until tender before adding sugar or syrup.

Cooking: The cooking of preserves is for the purpose of removing excess moisture, thus concentrating the syrup, and also for the purpose of causing the sugar to penetrate the fruit to impart the desired flavor and texture.

Prolonged cooking may result in caramelizing or "scorching" of the product and in its becoming broken or "ragged" in appearance. Most home made preserves are overcooked.

The cooking should be rapid and should not be carried too far.

Most preserves are "done" when a thermometer inserted in the boiling syrup and fruit registers 220 degrees Fahrenheit or when a Balling hydrometer inserted in the hot syrup in a suitable cylinder tests 55 to 60 degrees Balling or a Baume hydrometer tests 20 to 32 degrees Baume. A candy thermometer or a dairy type thermometer reading to 225 degrees Fahrenheit or above is more convenient than the Balling or Baume hydrometers, although one of these may be used if on hand.

Drug stores and some hardware stores can obtain these instruments. Every preserver and jellymaker should have one and use it. The Tycos instruments are very reliable.

Sterilization Preserves are often lost through molding or fermentation. This loss can be prevented by sterilization much in the same manner that canned fruits are sterilized.

The process is described below under strawberry preserve recipe No. 1.

Strawberry Preserves

This fruit makes the most popular of fruit preserves. Thousands of tons of strawberries are utilized annually for preserves and jams. Pure strawberry jam and preserves properly prepared are delicious.

Recipe No. 1—Use fresh, firm berries. Sort and stem carefully. Wash thoroughly. To the wet berries add one pound of sugar per pound of fruit. Bring slowly to the boiling point. Stir carefully during heating to prevent scorching but do not break the fruit by stirring too vigorously. Boil not longer than five minutes; three minutes will usually suffice. Remove from stove and allow berries to stand in the preserving kettle with occasional stirring for about 15 minutes. Skim. Then pour the fruit into a shallow pan to cool and to absorb syrup over night, or for 12 to 18 hours. Pack the fruit carefully in scalded jars. Glass top jars, such as the "E-Z" seal, etc., are excellent for the purpose. Seal with scalded caps and rubbers. Place the jars on a false bottom in a wash boiler sterilizer or large kettle. Cover with cold water. Heat the water to 185 or 190 degrees Fahrenheit (simmering hot) and maintain this temperature for 30 minutes. This will sterilize the product and prevent loss by mold or fermentation. The fruit should be whole and plump and of good color. Wrap jars in paper or store in a dark room to avoid loss of color from action of light.

Recipe No. 2—Sun Preserves: The sun cooking recipe is not suitable for foggy districts or during cloudy weather. To one pound of berries add one pound of sugar. Heat barely to boiling. Pour at once into a shallow pan. Cover with mosquito netting to exclude insects. Place in the sun until the syrup has become very thick and the berries have become plump. The preserves may then be packed in ordinary jelly glasses and sealed with paraffine. Usually sterilization is not necessary because of the density of the syrup.

Recipe No. 3—"Old Method": The usual recipe for strawberry preserves calls for one pound of fruit and one pound of berries. The mixture is brought to boiling and boiled slowly until the syrup becomes very heavy, that is, boils at 222 degrees Fahrenheit. The fruit and syrup are poured boiling hot into jars and sealed or into jelly glasses and sealed with paraffine. The finished fruit is often brown in color and badly broken, but often pleasing in flavor. Recipe No. 1 is to be preferred.

Figs

Recipe No. 1—Use firm ripe or slightly underripe fruit. Place in a thin syrup consisting of three-fourths pound of sugar and two pints of water for each pound of figs. The syrup will penetrate more satisfactorily if the figs are punctured through and through in several places with a fork. Boil slowly until the fruit becomes clear and the syrup heavy, that is, 60 degrees Balling, 32 degrees Baume, or a boiling point of 220 degrees Fahrenheit. Seal hot in jars.

Recipe No. 2—Sweet Fig Pickles: Prepare a syrup of 3 pounds of sugar, 1 pint of water, 1 pint of vinegar, 1 tablespoon of coarse ginger root, 1½ tablespoons of stick cinnamon. One tablespoon of whole cloves may be added if desired. All measurements level spoonsful. Parboil 3 pounds of the figs for three to four minutes in water. Transfer them to the above syrup and cook until figs are clear or a heavy syrup is obtained. Allow figs to stand in the syrup over night. Heat to boiling and pack hot in jars.

(Continued next week.)

The Cultivator Patterns

3276-3257. A Dressy Dress for the Matron—Waist 3276 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3257 cut in seven sizes: 22, 24, 26, 28, 30, 32 and 34 inches waist measure. A medium size will require 7¼ yards of 40 inch material. The width at lower edge is 1¾ yard. Two separate patterns, 10 cents for each pattern.

2860. Girl's Dress and Sun Bonnet—Cut in five sizes: 2, 3, 4, 5 and 6 years. Size 4 requires 2½ yards of 36 inch material for the dress and ¾ yard for the bonnet. Price 10 cents.

3597. Ladies' House Dress—Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 5 yards of 36 inch material. The width of the skirt at the foot is about 2 yards. Price 10 cents.

3611. A New Skirt—Cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. A 28 inch size will require 2⅞ yards of 40 inch material. The width of the skirt at the foot is 2¼ yards. Price 10 cents.

3618. Misses' Dress—Cut in three sizes: 16, 18 and 20 years. An 18 year size will require 3¾ yards of 54 inch material. The width of the skirt at the foot, with plaits extended, is 2 yards. Price 10 cents.

3619. Girl's Dress—Cut in four sizes: 8, 10, 12 and 14 years. A 12 year size requires 4 yards of 36 inch material. Price 10 cents.

3045. Ladies' Envelope Chemise—Cut in four sizes: small, 32-34; medium, 36-38; large, 40-42; and extra large, 44-46 inches bust measure. Size medium requires 2⅝ yards of 36 inch material. Price 10 cents.

3607. Ladies' Blouse—Cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size will require 2¾ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cents) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns.

CATALOGUE NOTICE

Send 15c in silver or stamps for our Up To Date Spring and Summer 1921 Catalogue, containing over 500 designs of Ladies', Misses and Children's Patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches) all valuable to the home dressmaker.

HINTS FROM HOUSEKEEPERS

How to Send Orange Blossoms East

I sent blossoms, or rather buds, to New York state, and was informed they arrived in fine condition. My friends had never seen the real orange blossoms, so may not have been good judges, but the blossoms were packed as follows: A medium sized orange was placed at each end of a long, narrow box and sewed securely to the box with a long darning needle, pierced through the orange and paraffined over pricked holes so juice would not ooze out. Then box was lined with soft tissue paper and packed solidly with stems holding buds, stuck half into the oranges, then covered with tissue paper.—Mrs. Chas. Casey, Pasadena.

Honey Drop Cookies—Layer Cake

2 eggs, 1 cup strained honey, 1 tablespoon butter, salt and flavoring, 1¾ cups flour, 1 cup chopped raisins, 1 teaspoon baking powder. Beat whole eggs until light, add honey and butter, beat till smooth. Add salt and flour to which has been added the baking powder. Flavor and beat well. Drop by spoonsful on buttered pan and bake in moderate oven.

Honey Layer Cake—Beat three eggs very light, mix in ¾ cup strained honey. Add alternately one cup milk and enough flour to make moderately stiff batter. Add 2 teaspoons baking powder with last cupful flour. Beat well, then mix in ½ cup melted butter last thing.

Honey Cookies—2 cups honey, 1 cup sour milk, 2 eggs, 1 cup shortening, 1 large teaspoon soda, salt, flour to make stiff dough, flavoring to suit.

Honey Sweetened Pie—Line pie pan and fill with well floured fruit, add honey according to sweetening required. Cover with top crust and bake in usual manner.—Mrs. A. C. McCready, Modesto.

Honey Recipes

In answer to the inquiry of Mrs. L. G. Rapp, Glendale, I am sending two tried and true recipes using honey.

Honey Cookies—1 cup honey, 1 cup sugar, 1 cup sour cream, ¼ teaspoon salt, 2 eggs, well beaten, 1 teaspoon soda, 1 teaspoon baking powder, flour to roll.

Honey Cake—1 cup honey, 1 cup sugar, ½ cup butter, 1 pint flour, 1 teaspoon baking powder, 2 eggs. Mix honey and sugar, add butter and cream. Then add eggs well beaten and lastly the flour and baking powder sifted together.—Mrs. Harold C. Rudolph, Esparto.

Honey Cake—In Peaches

Some one wants to know about using honey instead of sugar. This was printed in the Cultivator a few years ago and has been pronounced delicious.

For Canning Peaches—For 1 quart of peaches peeled and halved, 1 cup honey, ½ cup water. Let boil 2 or 3 minutes. If any scum rises take it off. Put the fruit in and let boil a little longer than when using sugar. Can same as other fruit.

Here is one for Cake—1 cup honey, 2 cups flour, 3 eggs, 1 teaspoon soda, 1 teaspoon cinnamon, a little cloves. This has been tried and is good.—Subscriber, Riverside.

HOUSEHOLD QUERIES

Peanut Taffy

Will some housewife give me a recipe for the good old peanut taffy?—Subscriber, Ono.

We don't quite understand "peanut taffy," but here are Lowney's recipes for peanut brittle and butter taffy. Perhaps our inquirer can use either or both of these, or if some of our housewife readers have a peanut taffy recipe we will be glad to give subscription credit for it.

Peanut Brittle—Two cups sugar, 2 cups shelled peanuts. Melt sugar; when a golden brown add chopped nuts, pour into buttered pans, crease and cool.

Butter Taffy—One cup molasses, 1 cup sugar, 2/3 cup butter, 2/3 cup milk, 1 tablespoon vanilla, few grains salt. Cook all ingredients till brittle when tried in cold water. Pour into hot buttered pans, crease and cool.

Schumacher Wall Board [Factory Seconds] per M $40

We have arranged with the Schumacher Wall Board Company to handle the seconds of this famous line of Wall Board.

The seconds may be damaged a little at the edges, and one side may not be quite perfect, but you will always get a satisfactory surface for ordinary use on one side, and the slight breaks or roughness at the edges can easily be repaired by using Schumacher's putty. It sells at 10c a pound.

You know what Schumacher's Wall Board is selling for regularly. Think of the economy it means to you to purchase it for $40 per thousand square feet. We have a good stock of this Board in 4-foot widths, 6, 7, 8, 9, 10 and 12 feet long.

This special price is made f. o. b. Los Angeles. There is no charge for cartage to the depot, or necessary crating to insure this Board reaching you in good condition.

LOW STYLE TOILETS, Complete $30

LAVATORIES $14

Perfect, Grade "A"
Our No. 60 style lavatory as illustrated. Completely equipped for hot and cold water, with high grade nickel-plated faucet and nickel-plated trap, everything complete to rough plumbing, $14.

Float Balls, 60c
Coppered float balls of high quality material, 5 inches in diameter.

Fuller Balls, 20c dozen
The washers used on Fuller faucets ½ inch and ⅝ inch.

This is a price that puts one of these toilets within the reach of every builder. High grade porcelain enamel low toilets, with virtrous china bowl and birch mahogany seat, completely equipped with angle valve and all necessary screws and washers to install.

Syphon Washers, 10c each
For the "goose neck" in high tank toilets.

MOLASSES

". . . roughage can be fed that would be wasted" says J. M. Christen, Pacheco, Cal.

Oak Dale Holstein Farm, of which Mr. J. M. Christen is owner, is the home of some of the best Pure Bred and High Grade Holstein cattle in the state.

Feeding is reduced to a science on such farms and the small operator can save money by adopting the methods these breeders have tried and found profitable.

For instance, in his letter to us, Mr. Christen says, "With Camo Cane Molasses roughage can be fed that would otherwise be wasted."

Are **you** getting all that you should get from the feed you are using? Unless you know what Camo Cane Molasses will do for you and your stock, you are overlooking a feed that is cheap and easy to feed.

Write us for the interesting booklet we have prepared, which tells about Camo Molasses and how to feed it.

Proper Care Doubles Manure Value

FOR more than a century it has been the custom on farms in parts of eastern Pennsylvania to store stable manure in walled yards, partly or wholly covered, in which the stabled animals are allowed to exercise during the day. Manure thrown into such a yard and thoroughly tramped by the stock loses much less through heating and leaching than does manure piled in the open.

It is well known that there is a great difference in the methods of management of barnyard manure on farms in the same locality and that the best yields are found usually where it receives the best care, says Farmers Bulletin 978 on Handling Barnyard Manure in Eastern Pennsylvania. Ten farms in Chester County, Pennsylvania, provide exceptionally good examples of efficiency in this direction. The average crop yields for the state as a whole are very much lower than those for 378 Chester County farms surveyed, while the averages for the ten farms selected as exemplifying a high degree of efficiency in handling manure are in some cases nearly 100 per cent above the state averages. The comparatively high yields obtained in Chester County, or the exceptional yields on the ten farms referred to are not due entirely to the way in which the manure was handled because Chester County soil undoubtedly is better than the average for the state and the standard of farm management is higher. But special attention to manure is a prominent feature of the farm management under which these high yields are obtained.

Manure Pit Adjoins the Barn

The typical barn of this part of Pennsylvania is the "bank barn," also known as a "Swiss barn" or as a "Pennsylvania overhang barn," the standard type of barn in that region for more than a century. These structures seldom are made of stone, as formerly, but are of frame on stone foundations which serve as the retain- used for grain, hay, or other feed. As ing walls for the basement or cellar.

The stables are almost always in the basement, the story above being a rule the stables open into an area called the "overhang" or "overshot," 10 or 15 feet wide along the whole front of the barn where the basement floor comes out even with the surface of the ground. The barnyard or manure yard is a feature of this kind of barn. This is a plat of ground adjacent to the overhang of the barn and into it the basement of the barn opens. Usually it is surrounded with a stone wall and may be anywhere between 30 and 100 feet square in area. This wall keeps the manure from being blown or washed away and protects the stock.

The ground floor of these barnyards usually is hollowed out in the center to prevent the liquid manure from escaping and often is paved with flagstones. Vents are provided in the lower side wall to allow surplus water to run off after rains. In some cases pits are provided to catch the liquid manure. The important value of this construction and care is shown by the fact that these walls are kept in good repair. It is noticeable, too, that in some cases repairs are being made nowadays of concrete instead of stone and mortar. "Under present conditions," says Bulletin 978, "stone is not economical for building the walls for such a manure yard except where surface stone is abundant and easily available. Elsewhere concrete will be found by far the better material."

Farms Produce Record Crops

On the ten farms chosen as examples to show efficient handling of manure, the yield of corn is maintained at 75 bushels an acre or more. Indeed, the average yield on the ten farms was 85 bushels an acre, as against a state average of 42.5 bushels. It is known that all ten farms are financially successful. The manure on these farms is practically all saved and is of very high quality. The ten farms have a wheat average of 29.75 bushels an acre against the state average of 18 bushels. The state produces an average yield of 33.1 bushels of oats, and three of the ten farms have an average of 45 bushels—only three of the ten growing oats. The ten farms saving and using their manure grow 2.65 tons of hay to the acre against the state's average of 1.43 tons.

Wins Cultivator Prize for May

Five cows owned by Eug. Biondini of Ferndale, Humboldt County, had the highest average production of butterfat for grades in the state dairy cow competition during the month of May, viz., 82.26 pounds, and the California Cultivator prize for this month was accordingly awarded to him.

The production of the individual grades for the month was: Rachel, 1,835 pounds milk, 4.9 per cent butterfat, 89.92 pounds butterfat; No. 1910, 1,699 pounds milk, 4.9 per cent butterfat, 83.25 pounds butterfat; Shortie's Best, 1,268 pounds milk, 6.4 per cent butterfat, 81.15 pounds butterfat; Hannah, 1,358 pounds milk, 5.9 per cent butterfat, 80.12 pounds butterfat; Twinnie, 1,507 pounds milk, 5.1 per cent butterfat, 76.86 pounds butterfat; average, 1,533 pounds milk, 5.36 per cent butterfat, 82.26 pounds butterfat.

These cows are all grade Jerseys, and so far as known, mature animals. They stand first among the groups of five cows in 27 different dairy herds that competed for the Cultivator prize the past month. Of this number the average production of all but six came above 50 pounds of butterfat, the lowest producing group averaging 33.36 pounds for the month. Five grades produced on the average over 50 pounds butterfat in the herds owned by the following dairy farmers: Eug. Biondini, Ferndale, 82.26 pounds; N. Hauk, Alton, 76.33 pounds; J. A. Genzoli, Loleta, 75.81 pounds; W. Terkelsen, Ferndale, 74.83 pounds; Earl Graham, Compton, 71.09 pounds; W. F. Early, Grizzly Bluff, 70.42 pounds; Peter Iversen, Grizzly Bluff, 70.04 pounds; M. L. Pontoni, Arcata, 68.75 pounds; Giacomini & Pedrotti, Waddington, 68.61 pounds; Leo. Christen, Waddington, 68.27 pounds; H.L.Wakeham, Santa Ana, 66.36 pounds; J. B. Harbers, Waddington, 65.63 pounds; Los Angeles County Farm, Hondo, 64.33 pounds; W. B. Gries, Ferndale, 63.34 pounds; Arden Dairy, El Monte, 61.17 pounds; F. F. Pellissier, Whittier, 60.62 pounds; Napa state hospital, Imola, 59.63 pounds; Adohr Stock Farm, Van Nuys, 56.69 pounds; R. H. Walrath, El Centro, 53.94 pounds; El Mirador Dairy, Pasadena, 52.56 pounds; J. C. Broady, Palm City, 50 pounds.

Eleven of these herds are located in Humboldt County, six in Los Angeles County and one each in Napa, Orange, San Diego and Imperial Counties. The Cultivator prize has so far gone six times to Los Angeles County, twice to Humboldt County and once to San Joaquin County.

THE GOAT INDUSTRY

(Continued from Page 825.)

are prolific breeders. Where goat raising has been undertaken on a large scale these common goats are often used as a starting point for breeding and the quality of the herd gradually improved through the use of pure bred rams. Goats, like milk cows, grade up very rapidly when bred to a pure bred sire, and some very fine herds of grades are being built up in this manner.

The price of a pure bred buck of any of the leading breeds runs from $25 to $100, while a pure bred doe will bring from $25 to $150, depending upon individual traits, while a grade or crossbred doe can be bought for from $5 to $50. It is largely milk production in the doe that establishes her value.

The Angora goat is raised largely for mohair, and Texas leads in the

number of animals kept for that purpose. Over a million Angora goats roam the plains of the Lone Star state, and although the average weight of the Texas fleece is 1.85 pounds, as against 3.7 pounds in Oregon, the former state shears the goats twice in a season, so that production is above the average.

The Angora goat originated in Asia Minor and large numbers are also found in South Africa where the mohair industry is an important one. In America the Angora has been found peculiarly adapted to logged over areas which spring up to dense growth of underbrush. By turning loose a band of goats in these waste lands a double purpose is effected, for the animals are able to wax fat on the vegetation, and they in turn keep clear the lands of undesirable weeds and plants that would prevent the growth of young tree seedlings.

In the Ozark mountains of southwestern Missouri it has become the common practice of owners of mountain lands to either run bands of goats for themselves or contract with other owners to drive their goats through certain brush covered areas for the purpose of clearing them for other uses. The animals are close feeders, consuming nearly everything green in their path, and in a short while a band can convert a dense mass of wild vegetation into a closely cropped lawn. In addition their fertilizing influence upon the soil has a certain value, and landowners sometimes pay goat owners from 50 to 75 cents per animal per season to clear the land for them. Thus the herd owners, by renting out their goats, have received good returns for their browsing instead of having to pay feed bills.

In addition to the rental income good Angora nannies will return an average of three pounds of mohair per year and will likewise bear a goodly number of kids.

It has been found from careful studies made of goat districts that to clear an acre of brush land requires the constant browsing of from two to five goats, depending on the density and size of brush. Two years of constant browsing with this number of animals results in absolute destruction of practically all underbrush, but it has likewise been found desirable to provide the animals with better range for at least a part of each grazing season. By increasing the number of goats used for land clearing operations and moving them frequently to different types of pasture, considerable areas can be kept clean and the health and development of the animals will not be interfered with.

DE WOLF HOLSTEINS AT BARGAIN PRICES

The dispersal of the H. A. De Wolf herd of Holsteins at the farm near Ripon, June 15, proved to be one of the greatest bargain events of the present sale season. Forty-six head, consisting of bulls, cows and young things, averaged $160, a valuation that was regarded as entirely too low for the class of cattle offered. A large crowd was in attendance and the sale list included 26 buyers, but they played their bids on a very short line. The top of the sale was $375, paid for Segis Pontiac Charlotte. Leeman and Kilgore of Ripon were the most active buyers for the better things and succeeded in annexing a number that should prove splendid investments.

The sale was managed by the California Breeders Sales and Pedigree Company. Col. Ben A. Rhoades, assisted by Col. John A. Davis, were the auctioneers.

ANNUAL RAM SALE AVERAGES $26

The second annual ram sale held by the members of the California Woolgrowers Association at the university farm, Davis, lacked quite a margin of coming up to last year's sale or to what might have been expected. The sale list included 262 head, mostly rams, of the following breeds: Rambouillet, Shropshire, Hampshire, Corriedale, Southdown, Romney and Leicester. The general average was $26. The top of the sale was made by a yearling Hampshire ram from the Straloch flock at $112.50. The Straloch flock also made the top average of the sale, receiving an average of $80. The sheep men present were in no way disheartened and all agreed that there was never a better time to engage in the business than now. Certain it was that the buyers secured breeding material that cannot fail to make good and to make money. H. D. Eddingfield of Mt. Pleasant, Iowa, was the auctioneer.

JERSEYS BRING RECORD PRICES AT AUCTION

That no serious deflation in the price of good livestock has taken place is evidenced by the total and average prices paid for Jerseys at the big auctions during National Jersey Week. Record sized crowds were on hand at four sales at which 278 head brought the grand total of $324,690, or an average of $1,168.

The opening event was at Coopersburg, Pennsylvania, May 30, where T. S. Cooper and Sons held their annual Decoration Day sale. The 84 animals that went through the ring sold for $72,000, an average of $857 per head. The top price animal was a six months old bull calf, Simone's You'll Do Fontaine, bought by R. J. Fleming of Canada at $3,500.

A special train had been chartered by the Meridale Farms management to take Jersey buyers from the A. J. C. C. annual meeting in New York to Meridale Farms at Meredith, and at this place 72 head brought an average price of $1,203 per animal on June 2. S. A. Guy, an oil operator of Shreveport, Louisiana, who also operates a large ranch in Texas, was the buyer of the highest priced cow, Golden Cymbeline, at $10,000. Returning on the same special train, the buyers attended the W. R. Spann & Sons sale at Morristown, New Jersey, on June 3, where 76 head of Jerseys brought $76,075, an average of over $1,000.

Many were of the opinion that wary pocketbooks would prevent the breaking of any records, but the Jerseys offered by L. V. Walkley of Southington, Connecticut, on Saturday, June 4, were wanted at higher prices than had before been offered, and 46 head were sold for an average price of $1,954, the highest sale average of the week. The sale of Gamboge Oxford Gem for $18,000 established a new world's record for cows of the Jersey and other Channel Island breeds.

Mr. Severin is a Poor Photographer, but---

WE do not ask you to accept Mr. Severin's recommendation. Examine the Papec for yourself. Compare it with any other ensilage cutter made. Note the Papec has six fans on the cutting wheel instead of three or four—the perfect knife clearance—the fact that it will cut and elevate from 3 to 30 tons per hour (at 600 r.p.m) to the height of any silo without clogging the pipe. These are only a few of the Papec advantages. You should know all of them, whether you intend to buy a cutter now or later. The coupon, mailed today, will bring complete information promptly.

Santa Fe Lumber Co.,
16 California St.,
San Francisco.

Gentlemen:

As you will see by the enclosed, I am a poor photographer. I took a half dozen "different shots" while cutting silage with the Papec N-13.

From a photographer's point of view the effort was a grand failure, but the redeeming feature is, however, that from the farmer's point of view the machine is equally a grand success, as it has been every time we had occasion to fill the silo the past three seasons.

We fill twice each season with barley early in the summer, and with corn from the same field later in the fall.

Am sorry we cannot supply you with any better snap shots but can recommend the N-13 Papec to any prospective cutter purchaser.

Sincerely yours,
J. H. SEVERIN.

recently started by the Live Oak farm bureau center.

Among the more recently established Duroc herds of Northern California is the one owned by Stanley S. Rogers, formerly a member of the staff of the college of agriculture but now engaged in farming near Davis. Mr. Rogers does not expect to maintain a large herd but is making his plans to have what he hopes will be ranked as one of the best herds of the state. It is probable that this new herd may be represented at the fall fairs.

V. F. Dolcini, owner of the June Acres Stock Farm, Davis, is building a large and modern hog barn to house his herd of Durocs. The barn follows the general plan of the swine barn at the university farm. Dolcini is preparing to exhibit a herd at the coming state fair.

A meeting of the California Cattlemen's Association is being planned the week of the state fair at Sacramento. An effort will be made to attract the largest attendance of the year.

The beef cattle show at the state fair this fall is going to be very strong. Practically all of the breeders of Herefords and Shorthorns have already picked tentative herds and are starting to condition them. Along with the old timers there will be a number of herds shown that have not been in competition before. Frank Van Natta has been chosen to judge the Herefords.

Advanced Registry tests in California as reported by the college of agriculture show total number pure bred animals on semi-official test for the three months beginning January 1 as 1,854: Holsteins 1,112, Jerseys 518, Guernseys 111, Ayrshires 29, Shorthorns 42, milk goats 42. The testers report:

"In addition to the 1,854 cows listed above we conduct monthly tests for several owners of grade cows who are competing in the state dairy cow competition. California during this period produced another 1,000 pound cow, Adirondac Wietske Dairy Maid, owned by Bridgford-Holstein Company, producing 31,899.9 pounds milk and 1,036.088 pounds fat. This is the fourth cow in California to exceed 1,000 pounds. Attention is also called to the fact that milk goats are increasing in our list with a probability of more to be heard from shortly."

The Third Annual Invitational Picnic was held at the Ratto Bros. Stock Farm at Ratto Station, Napa County, Sunday, June 12, with over 900 guests attending. The special train from San Francisco carried 600 guests and over 70 machines came from surrounding counties.

VALUE OF SKIMMILK

The University of Michigan has issued two bulletins on The Feeding Value of Skimmilk for Swine. A summary of the results of a large number of feeding trials by different experiment stations throughout the United States was made to determine the value of skimmilk as a supplement to maize and other cereal grains when fed to pigs.

It is pointed out that 415 pigs fed on cereal grains only made an average gain of 100 pounds from 486.5 pounds of grain and that 325 pigs fed on cereal grains supplemented by skimmilk made an average gain of 100 pounds from 266.9 pounds of grain and 785.1 pounds of skimmilk. This indicates that 100 pounds of skimmilk replaced 28 pounds of grain. Calculated on the basis of $50 to $80 per ton for the different grains used, which included maize, wheat, rye and barley, the value of the skimmilk ranged from 0.7 to 1.2 cents per pound. Much greater returns were got from the skimmilk when two to three pounds of milk was fed per pound of grain than when the milk was fed in larger quantities. It is computed that a pound of any of the following supplements would replace the designated amount of grain: skimmilk, 0.28 pound; tankage, 2.53 pounds; middlings, 1.05 pounds; linseed meal, 2.62 pounds; soy bean meal, 2 pounds. Buttermilk is considered to be equal in feeding value to skimmilk, and whey about half as efficient.

ECONOMIC LOSSES FROM OX WARBLE FLY

A careful study of tht economic losses produced by this pest will lead investigators and observers to some rather startling conclusions. It has been estimated that the ox warble fly is responsible for the following economic losses:

The bovine milk yield is reduced 10 to 20 per cent.

A loss of flesh in cattle due to the activities of the grubs and endeavors by the animals to obtain relief from the irritation produced by the larvae.

The meat of grub infested animals presents a greenish yellow gelatinous appearance at the points where grubs were located and the amount of such meat condemned is estimated at from one to five dollars per head.

Leather produced from grubby hides has been estimated to be worth only about two-thirds as much as a perfect hide.

The total loss to the cattle industry in the United States excluding the direct damage to beef is found to be not less than $55,000,000 a year.

When we consider the enormous economic losses from the activities of this pest we naturally should endeavor to devise efficient means for the control of ox warble flies. Various means of combating these flies and grubs, according to Herms, are:

The tumors in which the grubs occur may be treated with kerosene, benzine, turpentine or carbolic acid, a few drops of any of which are introduced into the opening by means of a machinist's oiler, or merely smeared over the surface. An ointment composed of sulphur and vaseline is also serviceable. These remedies are objectionable inasmuch as the grubs are not eliminated, but die within the tumor where they must be slowly absorbed; serious abscesses may result.

The grubs may also be destroyed in situ with a sharp scalpel or a hot needle, but here again the same objection as above is encountered.

A better method is to remove the grubs bodily. which can easily be done by squeezing them out if the grubs are about ready to leave the tumor. If not easily squeezed out, forceps with slender blades may be introduced into the opening, the grub grasped and removed. In some cases the use of a lancet may be needed to widen the opening in the tumor.

After removal, the grubs must be destroyed to prevent further metamorphosis, and the wound should be treated with a carbolated salve.—O'Toole.

Los Angeles County farm bureaus have been holding demonstratons under direction of Advisor Hodgson in the matter of inarching and saving gopher girdled trees. A young tree is set alongside the injured tree and inarched into the trunk of the injured tree.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins
June 29, Gotshall & Magruder, Ripon.
Berkshires
June 30, A. B. Humphrey, Escalon.

The 1921 premium list and classification for the California state fair has been issued and copies may be secured from Secretary Chas. W. Paine.

Liberty Girl, grand champion Poland China sow at the last state fair, died at the Straloch Farm, Davis, as a result of the extreme heat early this month.

The National Holstein sale held at Syracuse, New York, in connection with the annual meeting of the Holstein Friesian Association of America made a general average of $805, as compared to an average of $3,075 last year when California was represented by the top consignment. The highest priced female this year was the cow Arcady Segis Atia 2d, a 30 pound daughter of Ormsby Korndyke Lad. The top bull sold for $2,800 and was the 31 pound Fishkill Korndyke Ormsby, a son of the sire of the top female.

O. L. Raper of Glenn County has purchased the Shire stallion Dovecote King from the Blackhawk Ranch, Diablo. Dovecote King was bred in England and was sired by Barn King, a son of Locking Forest King. He was a winner in the old country and has proven a successful sire in this country. Mr. Raper who operates a large ranch also owns a herd of Shorthorn cattle.

Dr. C. P. De Langle of Yountville has been selected to tie the ribbons in the milk goat classes at the coming state fair.

Trevor H. Moore, well known among the livestock interests of this state through his work as a fieldman, has returned to his former home in Missouri, where he expects to locate.

Oran N. Nelson of the Oregon agricultural college will serve as judge of the sheep classes at the 1921 state fair.

T. S. Glide, owner of the Hilcrest Farm, Davis, and one of the pioneer livestock breeders of the West, recently suffered a large loss when his mountain range was destroyed by fire.

J. R. Bush of Merced, who was one of the heaviest buyers of Holsteins at the spring sales, has leased 1,000 acres of the famous Chowchilla home ranch and expects to move his cattle to his new location. Mr. Bush is planning to carry around 300 head of cows as soon as he gets settled.

Guy H. Miller of Modesto, veteran Jersey breeder of the West, was recently elected a director of the American Jersey Cattle Club. This is the first time California has been so honored and it is a well earned tribute to a man who has been an influential factor in the development of the Jersey in the West.

The Warren Gray Jersey sale recently advertised in this paper was held at Marion, Oregon, June 8, and resulted in a general average of $222.50.

The first livestock entry for the 1921 California state fair to be held here September 3 to 11, inclusive, has been received by Secretary Chas W. Paine from the Butte City Ranch of Butte City, Glenn County. This breeding establishment has entered a number of head of Shropshire sheep. Included in the entry are three registered Shropshire wethers. George Phillip, sheep expert of the university farm, considers one of the wethers good enough to go to the International.

Chas. M. Talmadge reports: "The Warren Gray sale of registered Jerseys held at Marion, Oregon, on June 8, was well attended and 30 head were sold for an average of $222.50 to 18 buyers. Three cows sold for $500 and up, with a top of $540 for Plymouth's Ixia Lola, a beautiful three year old cow, falling to the bid of Burton J. Neal of Turner, Oregon. Aside from three head going to British Columbia and one to Washington, the offering was absorbed by Oregon buyers."

Tom Dinsmore of the O. W. Ranch at Santa Barbara is not kicking on the price of hogs. Mr. Underhill has, by careful study and scientific breeding, evolved a Hampshire that will not fail to put on a pound a day with less than three pounds of barley and alfalfa pasture. With barley at a cent and a quarter Tom is making good money feeding hogs for which the butchers are glad to pay him around 10 cents.

The Grapewild herd of Guernseys owned by A. B. Humphrey at Escalon is rapidly forging to the front. It contains a lot of young females of his own raising that are winners. Starting with a foundation herd of cows rich in the blood of May Rose II Mr. Humphrey used the May Rose bulls, Bullion of Edgemoor and Don Adonis of Linda Vista. He is breeding the heifers to Nobleman of Rich Neck, another May Rose bull who was senior champion at the Los Angeles and Riverside shows last fall, and the calves which are being born have as many as 16 crosses of the popular May Rose blood lines. A large majority of the Grapewild females have high Advanced Register records and a couple of state champions and national class leaders are in the herd.

J. I. Thompson, manager of C. Harold Hopkins' Straloch Farm, Davis, has sold the roan two year old bull, Golden Milmar, to the Jack London Ranch, Glen Ellen. Golden Milmar was bred by Thos. T. Miller of Hollister and was sired by Diamond Choice, a son of Diamond Goods. His dam was Lespedeza Sunbeam by Imperial Gloster. Golden Milmar has been used to some extent in the Straloch herd and has to his credit some of the most attractive calves dropped this spring.

It was reported last week that the entire Jack London Ranch herd of Shorthorns had been sold to a Petaluma buyer. The report is without foundation and Mrs. Eliza Shepard, manager of the ranch, states that they not only do not contemplate selling the herd but rather have in mind strengthening it.

Business apparently keeps on following the recent Caledonia Shorthorn sale. Two bulls were sold last week to Frank G. Baum of San Francisco. The sale included Pine Grove King 19th, a Scotch calf sired by Pine Grove King and out of a Missie dam and Rose King, another son of Pine Grove King.

H. C. Witherow, manager of Greenwood Farm, Live Oak, has sold a young Duroc gilt to the United States Indian School at Greenville; a yearling boar to Tisdale Ranch, Grimes; boar pigs to the Stanford Ranch, Vina, and to Joe Gomez, Meridian. Mr. Witherow has also supplied gilts to the pig club

Guaranteed Grade Holsteins

I have for sale now a herd of wonderfully marked young Holstein cows. These cattle were bought as young things out of a dairy with state wide reputation for having Holsteins of superior breeding and production.

Every animal in keeping with my method of selling is positively guaranteed.

Terms can be arranged to responsible persons.

BLACKHAWK RANCH MAKES NOTABLE SHORTHORN PURCHASE

By R. P. Royce

That California is destined to own some of the greatest collections of Shorthorns in America is indicated by the activities of a number of the leading breeders in this state during the past year or two. Only last fall the famous Blackhawk Ranch owned by Messrs. Ward and Easton of Diablo received an importation of Shorthorns direct from Scotland, included in which was the white bull, Collynie Prince Lavender, secured from the world famous Duthie herd and one of the very, very few Duthie bred bulls in service in America. This month the Blackhawk Ranch was represented at a number of the leading Eastern sales and Mr. Ward, assisted by Manager Lovell, selected 16 females of as choice breeding as ever came West. This recent addition to the herd is of such character as to be of more than passing interest to the breeders of this state and will undoubtedly be regarded as a most important acquisition to the breed.

Blackhawk Ranch was the leading buyer at the Carpenter and Ross sale at Chicago in which the following purchases were made:

Imp. Nonpareil Bud, a roan February two year old sired by Dunglass Radiant, a son of Collynie Coronet, and out of a straight Nonpareil dam by Broadhook's Major. She is in calf since April to Imp. Golden Rosador.

Imp. Whiterow Buttercup 4th, a red and white March two year old by Primrose Prince, a grandson of Morning Star, and out of a Strowan Buttercup dam by Collynie Grand Knight. She, too, is in calf to Imp. Golden Rosador.

Imp. Beauty Blush, a roan two year old of the Kilbean Beauty tribe by Robert Bruce and out of a daughter of Windsor Lad, a bull bred by the King of England. She is also in calf to Imp. Golden Rosador.

Imp. Wrelton Mina, a roan two year old by Upsall Star 10th and out of a Campbell Mina dam. She carries the service of the good bull Straton Baronet.

Imp. Gay Lassie, a roan two year old by Robert Bruce and out of a Charlote Corday dam by Windsor Lad, mentioned above. The Charlotte Corday family is esteemed very highly in Scotland and is comparatively rare in America. No other Charlotte Cordays are owned in the West. She is bred to the Rosador bull.

Imp. Keilburn Rosewood, a roan March yearling by the noted Cluny Sir Augustus, a son of President of the Mint. Cluny Sir Augustus won his class at Perth in 1918 and was later sold for $10,000. The dam of Keilburn Rosewood is a straight Rosewood by Warsprite of Naemoor.

Imp. Woodborough Violet, a roan three year old by Edgecote Sceptre by Royal Sceptre and out of Woodborough Verona, a Queen Bess, by Newton Knight. This cow is bred to Imp. Rodney, one of the most popular imported bulls in America.

Imp. Golden Blinkbonny 2d, a roan three year old by Cluny Roan Prince, a son of President of the Mint and out of a Blinkbonny dam. She, too, is safe to the service of Imp. Rodney.

Imp. Oakwood Wimple is a roan three year old by Edgecote Commander by Earl of Kingston, generally rated as the greatest living Shorthorn sire. Her dam is by Revenue, a son of Golden Mint. She is well along to the service of Rodney.

Imp. Rosemary 112th, a white two year old by the Duthie bull, Merry Matador, and out of a straight Rosemary dam by Royal Mint. She was bought with a roan heifer calf at foot by Imp. Rodney.

Imp. Lustre of Maxwalton, a white January yearling by Redgorton Gauntlet, a son of Edgecote Czar and out of a Lustre dam by Gartley Courtier, a son of Proud Caledonia.

Maxwalton Dorothy, a roan February two year old by Revolution, the great son of Avondale and out of a Duthie Lady Dorothy dam. This heifer carries the service of Maxwalton Mandarin.

Sultan's Mina 5th, a red two year old daughter of Imp. Rodney and out of a Campbell Mina dam by Maxwalton Renown. Bred to Maxwalton Mandarin.

USE SHIRE HORSES

Breed your mares to Shire Stallions, good Shire Geldings are in demand. Get some registered Shire Mares.

Shire owners, record colts young, fees are double after one year old. Prepare Shires for fall shows, premiums are very liberal this year. For information on Shires write

W. G. Lynch, Secretary, American Shire Horse Association, Tonica, Illinois.

Kingwood Marigold, a roan February yearling by the noted Imp. Kingwood and out of a Marigold dam by Lord's Lad, a son of Lord Avondale.

In addition to the above females, a Rosewood by the $17,000 Anoka Champion and in calf to Rosewood Victor was secured from the B. F. Hales sale.

The value to accrue to this state from the addition of such distinguished breeding can hardly be estimated and the Shorthorn fraternity of California is to be congratulated that it numbers among its members men with the ambition, courage and progressiveness manifested by Messrs. Easton and Ward and others.

From now forward it will be difficult to understand the necessity of any local breeders leaving this state to secure breeding material and it is to be hoped that our local people will show their appreciation of the efforts our leading breeders are making to put California in the very front rank as source of high class livestock.

ALMOST A MILLION HOLSTEINS

The annual report of Secretary Houghton of the Holstein-Friesian Association of America discloses some interesting facts concerning the present status of the breed. During the year just closed 127,850 animals were recorded, a gain over the previous year of 11.7 per cent. This brings the total registration from 1894 to date up to 945,047, as shown by the following: 1894-1895, 3,187; 1895-1896, 3,070; 1896-1897, 2,536; 1897-1898, 2,963; 1898-1899, 6,479; 1899-1900, 4,746; 1900-1901, 5,108; 1901-1902, 5,990; 1902-1903, 6,841; 1903-1904, 8,044; 1904-1905, 9,773; 1905-1906, 11,823; 1906-1907, 14,650; 1907-1908, 16,534; 1908-1909, 19,591; 1909-1910, 26,176; 1910-1911, 32,889; 1911-1912, 37,535; 1912-1913, 43,315; 1913-1914, 48,086; 1914-1915, 67,680; 1915-1916, 72,665; 1916-1917, 73,847; 1917-1918, 88,279; 1918-1919, 90,887; 1919-1920, 114,503; 1920-1921, 127,850; total, 945,047.

The number of males recorded was 39,585, comparing with 36,791 for the fiscal year 1919-1920. The number of females recorded during 1920-1921 was 88,265, comparing with 77,712 for the previous year.

During the year 1920-21, 128,615 bulls and females were transferred on the books of the association, of which number 38,741 were bulls and 89,874 females; in 1915-1916, transfers of bulls 26,752, cows 42,014, total 68,766, 2.98 per cent. 1916-1917, bulls 27,434, cows 48,450, total 75,884, 10.35 per cent. 1917-1918, bulls 31,289, cows 60,230, total 91,528, 20.61 per cent. 1918-1919, bulls 32,254, cows 65,138, total 97,392, 6.40 per cent. 1919-1920, bulls 38,326, cows 93,497, total 131,823, 35.35 per cent. 1920-1921, bulls 38,741, cows 89,874, total 128,615, 2.43 per cent.

The application of the income from transfer fees to expenditure of the extension service followed the action taken in 1919 at Philadelphia, and at that time the fees to be charged were quadrupled. Although the new rate was not in force for the entire fiscal year 1919-1920 the amount received was $144,291.50, representing fees on 131,823 transfers, which was an increase over the previous year at the old rate of $110,135, and of 34,431 in the number of transfers made. The results of the fiscal year just ended show receipts of $182,620 for 128,615 transfers recorded. Under the caption, "Extension Service," are included practically all expenditures in the secretary's office not directly a part of the work of administration relating to registration; or, more specifically, it is paid out for prizes at fairs, for advertising space, printed matter, club organization, salaries, clerical service, etc., in a general effort to increase the demand for our cattle, the details of which appear in the report of the extension service.

The intimate relation between the prices for which animals are sold and the volume of transfers warrants a review of the results of public sales for the past ten years showing the number of sales, number of cattle sold and the average price received: 1911, 3,346 head sold for $685,918, average per head $205. 1912, 4,170 head sold for $814,970, average per head $195. 1913, 4,529 head sold for $1,115,009, average per head 246. 1914, 5,832 head sold for $1,534,806, average per head $263. 1915, 6,441 head sold for $1,592,203, average per head 247. 1916, 12,730 head sold for $2,474,843, average per head $194.41. 1918, 14,537 head sold for $3,754,603.50, average per head $256.47. 1917, 12,728 heead sold for $3,136,544.10, average per head $246.43. 1919, 18,279 head sold for $6,606,901, average per head $361. 1920, 18,836 head sold for $7,010,214, average per head $372.12.

TEN REASONS FOR A SILO

As the principal business of farming is to make money, the silo, especially on the stock farm, will best accomplish this end.

Corn silage is the farmer's cheapest source of digestible carbohydrates. As this is the principal food element required by our domestic animals it certainly is wise to provide it.

Summing up all the experiments conducted by some 23 different state experiment stations over a period of 15 years, silage has proven the most economic food for the production of stock and stock products.

There are about one-half million silos now in use in the United States, and it is difficult to find a user who is not more than pleased with the results from his silo. Silo salesmen use as a slogan, "Ask the man who has a silo."

The greatest expense connected with the livestock business is the cost of feeding the animals. The silo will lower this cost and therefore it should be one of the first considerations of the stock keeper.

The silo stands ever ready as an insurance against many of the common crop failures, especially such failures as damages from early frost, drouth and hail. Wet seasons often prevent the putting up of a crop of clover or alfalfa; this can be saved in the silo. Whatever is grown in the way of forage can be siloed and preserved for future use.

The silo is a labor saving equipment and it saves in storage space. Eight times more feed can be stored in the silo than in the mow. Cattle can be fed quickly and easily from the silo, as silage is a condensed form close to the point of feeding and is always in condition for feeding. Many feeding arrangements require the hitching up of a team to a wagon or cart and the hauling of feed from one place to another. A silo properly placed will do away with this.

Silage is a succulent, grasslike feed, easily digested, and seems to stimulate digestion. It has much the same effect as grass, giving thrift to the animal, and less sickness is experienced among the stock when good silage is fed. Silage stimulates the milk flow and all milking stock should receive it. Silage is cooling and appetizing and it prevents many of the troubles resulting from the overfeeding of concentrates.

Experiments and experience have taught that the most profitable feeding is liberal feeding, such as will supply the animal with its requirements. Quick growth is profitable growth, large production is profitable production, and the feeder of silage is more inclined to feed well, which means profitable feeding. The man with the silo is supplied with a large amount of good feed and in emergency it can be carried over for several years and still can be used with good profit.

Competition is keen in all lines of industry and the stock keeper with a silo has an advantage over his neighbor without one. In order to compete with the silo keeper, all stock keepers must use silos. World competition in growing stock and producing stock products will require the American farmer to use the best and most economical means. With the silo we need fear no competition from any country of the world.—Hoards Dairyman.

100 REGISTERED HOLSTEINS 100

At Public Auction — Wednesday, June 29, 1921

Dispersal of Gotshall & Magruder Herd, Ripon, Cal.

The offering will include the dispersal of the Gotshall & Magruder herd of 91 head, and 9 females from the select small herd of W. A. Walker, Ripon, California.

C. C. A. MARKET REPORT

Since our report of May 30 there has been a decided improvement not only in the tone of the market but in the actual sales which have been reported. San Francisco newspaper quotations have been advanced for the first time in several weeks, but they are still far below the actual sales being made in the country. One sale of prime steers was reported last week at 8c f. o. b. ranch. Other sales have been reported from 7c to 7½c f. o. b. ranch. Reports reach us of sales of prime cows and heifers as high as 6¼c f. o. b. ranch. Los Angeles packers are buying freely in Central California and as far north as Stockton. The severe drouth condition continues in Arizona and no beef cattle can be expected from that state or from New Mexico. The shortage of beef cattle in Southern California and south San Joaquin Valley is very pronounced. The shortage in the latter district alone is estimated, by competent authority, to be 40,000 head. Some California cattle have arrived at the Portland market and a train of 40 cars is expected to arrive there today. It is evident that the crisis for California cattle has passed for this season, and that from now on steady improvement can be expected. It is gratifying to know that no commission cattle are being sent to market. Under no circumstances offer cattle for sale until they are well finished.—Fred H. Bixby, chairman; James Barry, C. N. Hawkins, A. S. Goode, Owen Duffy.

Citrus Markets

Los Angeles, June 22, 1921.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 27,973 cars; lemons, 6,965; total, 34,938. To same date last season: Oranges, 22,262; lemons, 5,496; total, 27,758. From Central California to date this season: Oranges, 6,603; lemons, 184; total, 6,787. To same date last season: Oranges, 5,368; lemons, 289; total, 5,657. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total 283.

WEATHER REPORT

San Francisco, Cal., June 18, 1921.

New Agricultural Legislation

By R. N. Wilson

ALTHOUGH grains are among the important crops of California, this state producing more barley than any other, the grain growers as such have had little voice in the agricultural legislation enacted in the past. This was due to the fact that the grain growers were not organized either as a marketing or a general organization and therefore had no common clearing house for the problems of the industry.

During the recent session of the legislature two important measures affecting the grain interests were passed, the California warehouse act and the grain standards act, the first being sponsored by the California Farm Federation, the second by the Federation of American Farmers.

A measure dealing with gambling in futures was also sponsored by grain growers but was later withdrawn as being impractical.

The Warehouse Bill

The California warehouse act is very similar to the federal warehouse act and like the federal act permits goods to be stored according to grade, thereby establishing a greater degree of security for warehouse receipts. It is also worded to expedite bulk handling of grain. Under the laws formerly existing, if 1,000 bags of grain were stored in a warehouse and later sold these exact bags must be delivered to the purchaser. Through bulk handling the grades are pooled and when the 1,000 bags of grain are sold this quantity of a certain grade of grain is delivered regardless of who was the original grower.

The warehouse bill traveled a precarious route, its proponents several times despairing of its passage. Upon the original hearing of the measure in the agricultural committee of the assembly everything looked rosy as the committee unanimously voted it out with a favorable recommendation to the ways and means committee, which must necessarily consider it because of the appropriation of $25,000.

At the hearing of the ways and means committee a surprise was sprung by the then state superintendent of weights and measures, who maintained that the appropriation was too great and that the law should be administered by his department instead of by the department of agriculture. This attack confused the ways and means committee, which insisted that the bill go back to the agricultural committee for further consideration. Following a similar attack at a second hearing in the agricultural committee the measure was again sent to the ways and means committee with a favorable recommendation and had no difficulty in passing on through the assembly.

In the finance committee of the senate the bill was again almost stranded by one of the periodical waves of economy, and it was only through a maneuver by Senator Boggs, changing the outright appropriation to a revolving one, that it was kept afloat.

The measure was reached on the senate files on the last official day of the session, the senate clock proclaiming it April 29 but the calendar April 30. Proponents were certain of its passage, since no open opposition had developed, but without their knowledge an unsigned statement violently attacking the measure had been laid upon certain senators' desks. When the matter came up for consideration opposition sprang from many parts of the floor, and it was saved only by delaying the vote. During the next few hours the details of the bill were explained to the overworked senators, and unexpectedly the administration came to its rescue, so when the final vote was taken on Sunday, May 1, the measure pulled through by a fair majority.

Grain Standards

The grain standards act gives the director of agriculture authority to establish uniform grades for grains which are defined as including corn, wheat, rye, oats, barley, grain sorghums and beans. Any standards for grains now or hereafter established by the federal authorities shall be the official standards of this state. The act is permissive, but upon the demand of either buyer or seller of grains the transaction must be made on the basis of the grades established.

The only federal grades now available which would apply to this act are on wheat, oats and shelled corn, but considerable work has been done by federal agents on California barley grades, and it is probable that the tentative grades will be accepted until more data can be accumulated. Arrangements have already been made to place a competent and experienced grain man in charge of the grain work of the state department of agriculture, which must administer both the warehouse act and the grain standards act.

General Agricultural Laws

Besides the measures passed which affect individual industries there were a number of general agricultural interest. One of the most important appropriated $200,000 to provide for the investigation of the possibilities of the storage, control and diversion of water for public use and public protection. The plan as originally presented was known as the Marshall Plan, but a number of changes were made and the appropriation reduced from $500,000. The results of the investigation are to be presented to the legislature in 1923.

Agricultural College Investigation

The controversy, which at times waxed warm, concerning the location and methods of our college of agriculture, promises to be cleared up through the report of a committee which will have $10,000 at its disposal to study the agricultural education situation in this and other states. The committee will be composed of three farmers, one senator, one assemblyman, the controller of the state university, and one member from the faculty of the college of agriculture. The effectiveness of this committee will depend largely upon the personnel of the farmers appointed, since no opinions will be accepted from men who do not hold the confidence of the farmers throughout the state.

Another committee will select a site for a junior college of agriculture in Southern California. Approximately $160,000 has been paid for the land and water at the Riverside site, but there are other strong contenders for the location in Southern California.

Poison and Weeds

The economic poison law will require the labeling of all poisons sold as insecticides, fungicides, rodent remedies, etc. Serious financial loss has resulted where poisons were used concerning which few of the facts could be obtained, and such losses should be obviated by this act.

A law providing that weed free areas may be promulgated by the director of agriculture will do much to keep present free areas from becoming overrun by noxious weeds.

Largely as an experiment, $10,000 has been appropriated for the schooling of children of migratory laborers. Many of these children have been going to school only two or three months a year because their families moved from place to place where school facilities were not available. It is believed that where schools are provided for such children the tendency will be for labor to become more stabilized.

NEW OAKLAND ELEVATOR

The giant new concrete elevator of the Western Milling Company, which has been leased by the farm bureau, has begun operations and a rancher in Stanislaus County has initiated it with an initial shipment of approximately 14,000 bushels of grain.

While it is the intention of the farm bureau to operate the elevator as a terminal for bulk grain shipments, it is stated that grain will continue to be received in sacks until the farmers have had time to install equipment which will enable them to abolish the costly method of shipping grain in sacks.

W. H. Heileman, secretary of the California Farm Bureau Federation, declares that farmers should consider the use of loading stations at railroad sidings in sections not yet supplied with elevators. He declares that only by such methods will they be able to ship grain in bulk this year.

More than 2,000 tourists registered for the opening week end at General Grant Park. The roads to the park are reported to be in excellent condition. More accommodations are available than in previous years, and the park authorities anticipate a record season.

A Model Brooder House

By Jean A. Koethen

ONE of the most comfortable and carefully arranged brooder houses I have seen was found at the McAllister Ranch just out of Inglewood. It is about 50 feet long and equipped with a hot air brooding system. The cut shows the southern exposure. Each window outside corresponds to a run inside which holds from 100 to 150 baby chicks. In order to keep too much direct sunshine from the runs every other window is painted white. Every run has its own brooder, sour milk fountain and dry mash trough as well as its own outside run. An alley at the rear of the brooders makes attendance easy.

Long Brooder House on McAllister Ranch

W. H. Brannan, the new manager of the ranch, has had wide experience with large flocks in northern California and is putting his knowledge of little chicks and their needs into immediate action. The day I saw them there were 2,000 chicks in this brooder house, all just three days old, and 3,000 older chicks in the two other houses around big brooder stoves.

Out of these 5,000 chicks Mr. Brennan expects to raise at least 4,600. Last year he raised 1,150 out of 1,200, and he believes that proper care will raise 95 per cent of every hatch.

Simple Feed

When chicks are raised on such a large scale no fancy feeds can be used. Simplicity in feeding is the first essential. Semi-solid buttermilk diluted 20 to 1 is given in fountains as soon as the chicks are put in the brooder and fine chick grit is placed before them in trays but nothing else is given till they are at least 36 hours old. The nursery feed is commercial chick feed which is fed in troughs at 6 a. m. and then at 9, 12, 3 and 5 o'clock. As soon as they have learned to eat, and from that time on, the chick feed is scattered in the rice husks which are used instead of straw for litter. Under the rice husks is coarse sand.

On the third day from 9 to 11 and 1 to 3 a commercial chick mash is placed before the chicks in troughs. After the first week it is left before them all day. No greens are given the first week. Beginning the sixth or seventh day cut clover is fed at 1 o'clock.

Brooding With Gas

All the heat in these brooder houses is supplied by gas which is found to be less economical than oil but satisfactory in other respects. To keep the little chicks around the stoves from getting too close at first the stove is surrounded by a wire fence, but this is needed only a day or so for the chicks quickly learn to stay where they are comfortable.

When Mr. Brannan took charge of the ranch on March 21 there were 2,500 hens with a daily egg yield of about 1,000 eggs. He culled them by the Hogan system to 1,500 and still got the same number of eggs as before. The number of layers is to be increased another season to 5,000, Oregon agricultural college stock being used as the foundation.

Poultry Queries Conducted by J. A. Koethen

Lack of Moisture

I wonder if you can tell me why my turkey eggs hatched so badly. I set 11 eggs under a chicken hen, and only one poult was able to get out without help. Those we helped out were weak and crippled. The hen was sitting in the barn, and the weather was hot part of the time. I was told the trouble was lack of moisture.—Subscriber, Pond.

It is customary to set turkey eggs on the ground and to moisten them occasionally toward the end of the hatch by sprinkling with warm water or by sprinkling the ground around the nest. In dry weather this is quite important because the turkey egg has a tough inner lining. Undoubtedly lack of moisture had much to do with your poor hatch.

Why Turkeys Die

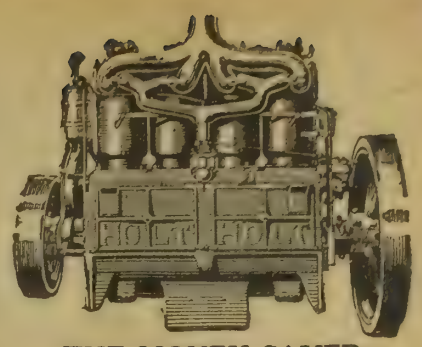
Please tell me why my turkeys die. I feed dry curd, cracked wheat, corn and oats. They have green range and have never been wet. I found yellow spots on the livers of the dead ones.—Subscriber, Ukiah.

Little turkeys should have no corn and very little grain of any kind. The most successful breeders feed a mixture of hard boiled egg, stale bread or rolled oats and greens till the poults are about two months old. You could use the curd instead of egg if more convenient. A little steel cut oats might be used instead of the rolled oats, but it is better to omit other grain. Feed three or four times a day what the poults will clean up in a few minutes and never let their crops get stuffed full. Feed barley, wheat and bran after two months, and never corn till fattening time. Be sure they have grit or shell before them. If you have it give them a pan of clabbered milk every day. This is one of the best preventives of blackhead.

Intestinal Worms

Please tell me what can be done for intestinal worms.—Subscriber, Los Angeles.

A pound of tobacco powder to 50 pounds of dry mash is the prescription of Dr. Beach of the poultry division. Keep the mixture before the birds three weeks, then take away three weeks and return for another three weeks. This treatment may be kept up till all signs of worms have disappeared.



THE MONEY SAVER
The Holt stationary engine is particularly adaptable for operating pumping plants. It is economical, long lived and dependable—Holt construction throughout.
It is the same engine as used in "Caterpillar" Tractors. That's a pledge of service as strong as any guarantee.

Rubber Boots
For Ranchers and Irrigation Work
$3.98

A wonderful value in Hip or Knee Length Rubber Boots made of REAL gum Rubber with heavily reinforced seams. Made to order of the English Government for the British Army at actual COST OF MORE THAN WE ARE SELLING THEM FOR. Will stand all extremes of heat and cold and made to give extra long wear. Finest quality pure gum rubber with extra heavy soles. This is one of the very finest BARGAINS we have ever been able to offer our customers and the stock is limited so get your order in very early. Nothing better can be worn by ranchers or men who work in irrigated districts, rice fields, etc. This quality of Hip rubber boot would usually cost you $7.50 to $8.00. Remember you can get the full HIP boots for $3.98 or the shorter knee length boots for $3.29. Be sure to mark which kind you want on the coupon below. WE DO NOT WANT YOUR MONEY IN ADVANCE. We take all risk because these boots are such wonderful values. Fill out coupon NOW and mail at once if you want some of these boots before they are sold out.

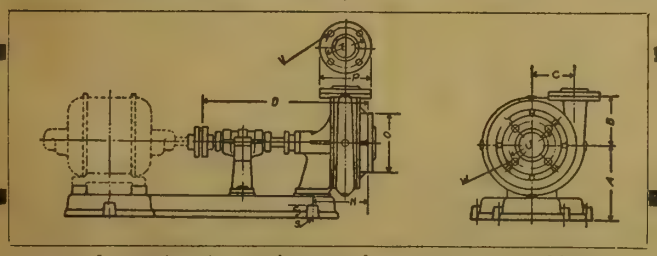
Pump Engineering Service FREE



Let our corps of expert water engineers solve your water problem.

We Are Sole Agents For

American-Marsh Closed Runner Centrifugal Pumps, direct connected or belt driven; Luitwieler Deep Well Pumps; Kawanee Water Supply Systems.

During the last twenty years, we have solved some of the most difficult water problems for California ranch owners.

LET US KNOW YOUR WATER TROUBLES Write for Bulletin No. 25

SIMONDS MACHINERY COMPANY 117-121 New Montgomery Street SAN FRANCISCO

THE FRESNO NURSERY CO. INC. TRADE MARK RELIABILITY QUALITY SERVICE FROM THE ROOTS UP

Headquarters for

FRUIT TREES

Our trees are grown under most favorable conditions in the choicest spots in California.

Let us know your requirements early.

Fresno Nursery Co.

Fresno, California

FUMIGATION

WITH

Liquid Hydrocyanic Acid

Is Convenient, Economical and Effective

We have developed a new type of **atomizing pump,** entirely different in principle and eliminating the unsatisfactory features in all previous devices.

It is positively **accurate, simple** yet **substantial** in design and easy to operate.

IT DOES NOT LEAK

It delivers the dosage as an extremely fine mist, which quickly vaporizes.

ACTUAL OPERATION has proven the efficiency, accuracy and success of this fumigating pump.

AERO BRAND HYDROCYANIC ACID with this pump and our service will be valuable to you this season.

PATENTS

Owl Fumigating Corporation is sole licensee under the Dingle patents for the manufacture and use of Liquid Hydrocyanic Acid for fumigation.

OWL FUMIGATING CORPORATION

AZUSA, CALIFORNIA

KROGH PUMP AND MACHINERY COMPANY

We also manufacture Well Casing, riveted Steel Water Pipe, Tanks, and Corrugated Culverts.

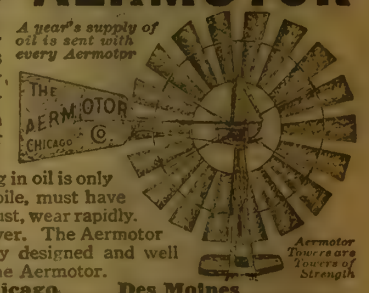
Western Pipe and Steel Co. of California

1758 N. Spring St., Los Angeles — 424 Market St., San Francisco

Fresno, Bakersfield, Taft

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill



Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.
